NOTES.—Assays made this week from mineralized quartz out of the Silver Bullion lode, ran $497.20, $155.50 and $33 per ton. Doyle and Howkins, from Bullion Camp, on Saturday were exhibiting fine specimens of silver from that camp. Six inches of solid mineral-carrying galena, gray copper, and green carbonate of copper have come in on the hanging wall of the Rochester lode, Spring Gulch. Work is progressing day and night on the Silver Ring lode, Cascade district. Some very fine iron carrying large quantities of free gold is being taken out at a depth of twenty ft in the shaft of the Old Squaw lode, Spring Gulch. Two ft of solid ore that will mill $100 per ton can be seen on the hanging wall of the Rio Grande lode, Spring Gulch. The contractors have reached a depth of 97 ft in the shaft. Some very high mineral has been struck in the Sheldon, Cascade district. A twelve ton lot of ore from the Pay Rock mine at Georgetown, last week gave returns in silver per ton: first-class, 975 ounces; second-class, 417 ounces; third class, 146 ounces. Eight tons of surface quartz shipped to the Mott Concentrating and Sampling Works from the Lexington group, Squirrel Gulch, gave 7 oz., 3 cwt., 3 gr. of gold worth twenty dollars per oz. Mr. John Ward cleaned up 20 oz. gold from his placer last week, the result of two eight hour shifts of four men.

SILVER MOON AND BOBTAIL.—Correspondent of Denver *Tribune*, Aug. 15: In most instances property in Williams Fork is yet in first hands. It has never had a boom; the aid of capital has not been invoked, and yet development has gone on. Of the new strikes the most prominent are those of the Silver Moon and the Bobtail. The first is developed by a crosscut 175 ft in length, at which point the foot wall of the Silver Moon lode was cut, and hugging it close, from six to eight inches of high grade sulphuret and galena ore, bright and native silver. The owners are now cutting through to reach the hanging walls and the indications are good for a second streak. From a doubtful experiment, the Silver Moon has in the last day or two become a pay mine. It is owned by Denver and St. Louis parties. The Bobtail, the wonder of the camp, has added to its fame a two-inch streak of ruby silver ore. The La Plata is working in very rich ore, while the Ready Cash, with daily shipments of ore, is proving a bigger bonanza with each day's development.

GUNNISON ORE SAMPLING CO.—The machinery and laboratory appliances are now on the road from Chicago. The works will be in running order by the 20th of this month. The exact site of the mill is not yet fully determined on, but will either be in Pitkin or at Quartz, three miles from Pitkin. Quartz is the present shipping point of the Tin Cup mines. The daily production of the Pitkin and Tin Cup districts combined is about seventy tons and will ere long reach one hundred and fifty tons.

MONTEZUMA.—Georgetown *Miner*, Aug. 18: Supt. Buckland has three teams hauling to the new Brittle Silver mill from the St. Elmo tunnel, where he claims to have two ft of ore in the Mark Twain and three ft in a lode recently struck, which he says runs ninety ounces. On the Herman shaft, Ed. Guihor has six ft of ore. The Wild Irishman, an extension, has a rather small streak, which nets $69 per ton over all expenses. The Silver Prince, another extension, does nearly as well.

INDEPENDENCE.—The Independence mine, on McClellan mountain, East Argentine district, is under lease to J. B. Johnson, who has twelve men at work, on ore that averages from 100 to 125 ounces silver to the ton and 50 per cent lead. Mr. Johnson had four tons milled on the third that returned 316 ounces silver and $4 in gold to the ton.

IDAHO.

ELKHORN MINE, Ketchum *Keystone*, Aug. 15: The pocket of ore recently noted in the *Keystone* as the largest ever encountered in the Elkhorn mine, was about the average grade of ore heretofore extracted. Since, a connected stope on the vein 20 ft from top to bottom, is marked by a beautiful ledge of galena and carbonates containing a distinct vein of clear block galena, four ft wide throughout, remarkable in returning an assay value from several samples of 175 ounces per ton. This is 75 ounces more than the average of the galena heretofore, and is indeed of unusual rarity in lead mines.

SNAKE RIVER PLACERS.—Butte *Miner*, Aug. 18: An Eagle Rock correspondent of the Salt Lake *Tribune*, says: The gravel bars on Snake river are becoming valuable. There is not a claim within five miles of Eagle Rock that is not staked off. Scarcity of water is a great drawback. The Snake River Water Co. is furnishing all the water now used. This company can supply water for 30 miles in length, but except where the gravel banks are tributary to the canal, the gravel is, for the present, unworkable. One man with plenty of water can wash out half an acre during the season. He can wash out $12 every day, at a low estimate. This makes about $4,000 gold that can be saved in every acre of these gravel beds. How many acres are there? There will be gold enough washed out and saved in the next ten years, from the Snake river gravel beds, to pay the national debt twice over!

THE PHILADELPHIA SMELTER.—Wood River *Times*, Aug. 15: Since May 25, the Philadelphia Smelting Co. have shipped 96 full carloads of bullion to Omaha, and sent out four more loaded to-day, making 100 carloads, which is valued at $325,000. In future there will be 40 tons of base bullion shipped from the works to the railroad every day.

SILVER FORTUNE.—Professor Thompson, who last spring visited Wood River with Supt. Taft, of Galena, recently took a bond on the Silver Fortune mine, owned by Jack Reid and partner, and located on the East Fork of Wood river, near the iron mines. A shaft sunk 30 ft on the vein exposed a solid body of high grade galena ore three ft wide. The price in the bond is $30,000.

RICH STRIKE.—Joseph M. Taylor, the lucky prospector who discovered the Davitt, and other valuable mines, has just made a strike in the Albion claim, located on the head of Lee's gulch. He has uncovered for 7 ft an 18 inch vein of solid ore which assays in the hundreds of ounces in silver, and several parties are skirmishing for a bond on it.

MAYFLOWER.—Supt. Havens arrived yesterday from Silver City. The vein on the Mayflower is 60 ft wide at the end of the lower tunnel, 900 ft in from the mouth. Burleigh drills will be used to chamber out the ore. The Mayflower has twice the amount of pay ore shown up at the time the mine was paid for. It was purchased for $375,000.

HECLA.—Burgess and others, who own the Hecla mine on Copper canyon, are having ore extracted which runs 180 ounces in silver to the ton. At the end of the tunnel, 242 ft in the mountain, the vein averages four ft. They have on the adjoining ground an incline shaft 40 ft deep, and a foot of solid galena in the bottom which assays 160 ounces in silver.

MONTANA.

ANACONDA.—Cor. *New Northwest*, Aug. 17: An order was lately received to increase the capacity of the smelter from 300 to 500 tons per day, and the two massive stone walls nearly completed have therefore been built each 1,000 ft long instead of 750 as at first commenced. On the left are two other stone walls built and terraces above are being blasted out of the solid granite for the concentrator. Lumber and bricks are being delivered and the boss carpenter is expected daily. The prospects are they will get the building well under way before winter sets in. About 80 houses are in various stages of construction, including seven hotels and boarding houses, twelve saloons, and six stores.

HELENA.—*Independent*, Aug. 17: An important business transaction was the recent purchase of the Alta Montana Co.'s mines and reduction works by the Helena Mining and Reduction Company. The furnaces at Wickes will be used for the present where they are. At the foot of the Alta hill, two miles south from the old works, where there is plenty of water, a new concentrator of 150 tons daily capacity, is building, and the concentrator at the Comet mine is to be enlarged to double its present capacity. Within four months from this date a railroad will be in operation between the works and the main line of the Northern Pacific at Helena. These improvements involve the expenditure of nearly a half million dollars. Enlargement is also the order at the Gregory Con. works. Their old concentrator is to be torn down and a new one erected having a capacity of 75 tons per day. It will be equipped with two of the largest crushers and four of the largest rolls made and will have two compartments. The Ætna Iron Foundry, of San Francisco, has contracted to complete the concentrator and have it in running order within three months from date. The mine is reported as making the best showing ever known in its history. For 400 ft along the sixth level, the galena is continuous. The 60-stamp mill of the Boston and Montana's Gloster mine has been shut down for about a week, and a contract has been made with the Union Iron Works to put in 24 pans and 12 settlers, besides 48 settling tanks. Another boiler will be added, making four and a 200-horse power engine will be added, which will make an aggregate of 300-horse power.

NOTES, Butte *Miner*, Aug. 15: Sixty-four bars of bullion were shipped last week, valued at $93,100. The Alice is credited with $53,904; Lexington $18,224, and Donnell, Clark & Larabie, $23,032. At this rate of bullion production the Alice will soon resume the payment of dividends. At the Moulton the air connection from the 300 southwest drift has been completed and the winze is now 60 ft deep with 2 ft of 100 ounce ore in the bottom. W. A. Clark has commenced operations on his purchase, the Neptune. Barker & Caldwell are working the Neptune No. 2, south of the Moulton. At a depth of 42 ft a ledge of ore 45 ft wide has been struck, which is believed to be the south fork of the great Rainbow lode. Baker & Sarchet have been developing a new claim called the Swansea, situated east of the Colusa. At the bottom of a 100 ft shaft a ledge 25 ft wide sampled 16% copper and 80 ounces silver. The Stemple mine is a promising prospect, leased by Hammer & Connor, who are getting out rock which assays from 20 to 200 ounces. The Pollack work under a lease by the Clark Brothers is looking splendid. A tunnel has been run in 25 ft from the east side of the hill striking a 2½ ft ledge, from which the first-class rock mills 120 ounces and the second 72 ounces. Frank Cary and Mike Sullivan are working the Amy Silversmith center lead. They have sunk a shaft 30 ft deep and are in good ore. A sample from the dump yesterday sampled 100 ounces.

NEW MEXICO.

NOTES.—Kingston *Tribune*, Aug. 16: Placer gold has been discovered near Albuquerque. The Hardscrabble mine in Socorro county, has been sold for $125,000. Ten tons of ore shipped from Bremen's '76 mine, Silver City, N. M., to Pueblo, averaged $800 per ton. A $10 gold nugget was washed out in Baxter gulch the other day, by Dr. St. Charles. The Midnight mine, Magdalena mountains, has a wide vein carrying ore that runs from 30 to 40 ounces in silver and a good deal in gold. A carload of ore shipped from the mines of the Solid Silver Co., at Bullard's Peak, Golden, Col., netted between $7,000 to $8,000.

PACIFIC NO. 2.—*Southwest Sentinel*, Aug. 15: The ore from Pacific No. 2, now on exhibition at the store of Neff, Bell & Stevens, demonstrates that Pinos Altos is far from being a played out camp. The specimens (about a hat full) are more than half wire gold. They are from a pocket which was struck in the mine, three weeks since, and from which fully 200 pounds of wire gold ore was taken. The ore on all sides of this pocket was very rich, running into the hundreds, and in all about 15 tons were taken out. The Pacific No. 2 is owned and worked by Wm. Skillicorn.

FLEMING.—*Southwest Sentinel*, Aug. 18: The Old Man mine looks better than ever. Southwest from the shaft a working tunnel has been started, and is in ore already. At present the company have 400 sacks of ore awaiting shipment, and on the dumps there are upwards of 1,500 tons of milling ore, having a value ranging from $50 to $100 per ton, which will be reserved until such time as the company will have completed their mill now in contemplation.

OREGON.

GORDON.—Bedrock *Democrat*, Aug. 15: The old quartz mill is running steadily. A. J. Lawrence is at the helm, but he is ably assisted by John Bulger and John Griffin, old mining experts. The rock that is being worked is taken from the new discovery on the Gordon, and rumor says, is extremely rich.

UTAH.

COMET.—Salt Lake *Tribune*, Aug. 21: The value of ore from the Comet mine, Copper gulch, has been demonstrated by sending a carload to Colorado for treatment. After paying the cost of hauling to Frisco, loading on cars, transportation to Colorado, commissions, etc., it netted to the owners over $60 per ton. For a single test of one carload, this did well, and when the company get their own reduction works they expect to get still better returns. They are putting in hoisting works. Drifts are being run on the vein, crosscutting is being done, and general development work is going on satisfactorily.

MARYSVALE.—Cor. of Salt Lake *Tribune*, Aug. 17: At last the mining boom has struck Sevier county, and this time in the shape of an immense deposit of copper ore. I say immense from the fact that its full dimensions have not as yet been made out. Enough, however, has been uncovered to show a breadth of over 100 ft, and as yet no hanging or foot walls. A tunnel of about 35 ft has been run in to crosscut it, and all is in solid ore. The ore seems to consist of ruby, black and red oxides, and ranges in assays from 15% to 45% copper, with a perceptible amount of gold. Considerable excitement was known to exist in certain mining circles at the Vale, but as the find was kept secret from all but a few, it was not generally known until within the past few days. It is in Sevier county, about six miles from Monroe, and only a short distance from the Sevier river. A new district has been formed, and is known as the Henry district, and the mine as the D. A. Giles copper mine.

A Case in Point.

[Written for the PRESS by C. H. AARON.]

It is constantly asserted by the promoters and inventors of new metallurgical processes and machinery, as a *raison d'etre* of their schemes, that there is urgent need of improvement in our methods of treating more especially the ores or matrices of the precious metals. That there is at least room for such improvement will not be denied, and it may perhaps be said that, within the last fifteen or twenty years, more progress has been made in the metallurgy of copper, lead, iron and steel than in that of gold and silver. In iron and steel especially some radical changes have been made with very important results. In copper we have new styles of smelters, new leading processes and the successful application of the Bessemere process to mattes, as well as of electrolysis to the refining of black copper producing therefrom a malleable metal of a high degree of purity with great economy. In lead also new methods of smelting and refining have been introduced, but, except in so far as improvements in the working of lead and copper have indirectly affected the metallurgy of gold and silver in the direction of argentiferous and auriferous smelting ores and mattes, but little has been done, comparatively, toward perfecting the extraction of the precious metals, of which the losses in fumes and tailings are still about as large as they were twenty years ago, although some advance has been made in point of economy by means of labor saving contrivances.

What is here meant is not to disparage the various excellent crushers, pulverizers, concentrators and amalgamators that have had their birth within the period named, but that no radically new process has been developed. The writer was recently called on to treat a silver ore, of which the composition was roughly as follows: Quartz, calrite, iron and manganese, oxides and probably carbonates, lead molybdate, silver chloride, and silver in unrecognized forms of combination; also a very little copper carbonate. The ore was practically free from sulphur, arsenic or antimony.

This ore was considered to be "free milling," and was so to the extent of the contained silver chloride, which was easily reduced in pans with salt and quicksilver, or extracted by lixiviation with sodium hyposulphite. But this included only from seventy to eighty per cent of the total siver contained; the remainder was in other combinations, and was practically beyond the reach of any known process of extraction. The large proportion of calcite present forbade the use of bluestone, copperas, or acids in conjunction with the salt, it being found by experiment that more than five per cent of strong sulphuric acid, or fifty per cent of copperas, was neutralized or decomposed in a very short time, leaving the silver compounds unaffected

Copper dichloride dissolved in hot brine being compatible with the presence of calcite, and being a powerful reagent for the conversion of many silver compounds into chloride, held out a hope of better results, but on trial it also was found to be speedily decomposed, the copper in solution being replaced by manganese. This is not the first time that this reaction has been observed, and, from the fact that the manganese remains in solution, it appears that calcite has no power to decompose the soluble salt of that metal which is formed. On the other hand, large quantities, even up to twenty per cent of copperas or bluestone, added to the pulp in the pans, left after a short time no trace of any soluble metal, salt giving a precipitate with sodium sulphide.

Disregarding theoretical considerations, all the usual "chemicals," including bluestone, copperas, acids, cyanide of potassium, sodium, amalgam, ashes, etc., were tried in succession, and so far as they were compatible, jointly without benefit; also grinding and not grinding in the pans. The only thing which was of any avail was the addition to each charge of a few pounds of precipitated copper, which acted as an auxiliary in rapid reduction of the silver chloride, thus increasing the working capacity of the pans by lessening the time during which it was necessary to work the pulp.

We were led to this use of cement copper by the following observed facts. The first work done on this ore yielded bullion .830 fine, and left no soluble silver in the tailings, yet the liquid filtered from the tailings showed no iron in solution, although bluestone was used in the working. The second bar was .996 fine; the tailings gave higher assays, and a little silver could be extracted from the tailings by leaching with hypo. The third bar was .999 fine; in fact, the assay, corrected by a check, indicated 1,000 fine, and the tailings showed an increased proportion of soluble silver. It was ascertained that the use of bluestone neither improved the yield nor contaminated the bullion by reduction of copper, whence it was evident that the copper in the first bar was not derived from the bluestone used, nor was the better result attained to be ascribed to that, although apparently due to the presence of metallic copper.

It was thus remembered that the pans had previously been used in working roasted ore containing copper, and yielding bullion only about .700 fine, and no doubt all the quicksilver not retorted contained copper, while the pans, notwithstanding a "clean-up," were lined more or less with coppery amalgam. This suggested the use of precipitated copper in the working, which proved effectual, the tailings retaining no soluble silver worth notice, and the bullion being reduced to .996 fine. No doubt equally close work could have been done, and pure silver produced by allowing a longer time for working. But all this did not affect the main question. That portion of the silver which existed in forms other than that of chloride remained in the tailings, and as the ore was too poor for roasting, under the prevailing conditions, we were forced to content ourselves with the extraction of 70 to 80 per cent of its value. No doubt this ore could be worked with satisfactory result if circumstances had permitted of its being brought into conjunction with smelting ores of a complementary character, and it is now some years since the writer endeavored to direct public attention to the great advantages to be thus gained by the establishment of metallurgical centers, with cheap transportation; but this was not possible, and the consequence was that an ore containing $35 to $40 per ton (assay value) in silver, could be made to pay but very little more than the expenses of mining, hauling and milling.

This is but one of many such cases, so that even if smelting works with the command of a variety of ores for mixing were practically accessible, it would be impossible for them to dispose of the large quantities of low grade dry ores which could be produced. Concentration was tried with this ore, but, as was expected, it was found that while the horn silver could be saved very well, the portion which eluded amalgamation also escaped concentration to a great extent, by passing off with the slimes, while that which remained inclosed in the heavy sand was not rendered more amenable to treatment. What is needed for such ores is a radically new process which will extract cheaply 95 or 98 per cent of the silver from any existing natural combination. Here is a chance for somebody to "revolutionize" the metallurgy of low grade silver ores to his own profit and glory, and to the great benefit (?) of the world.

Shipping Ores from Utah.

"What does the hauling of ores from Utah to Kansas City and Denver mean?" asked a Salt Lake *Tribune* reporter of one of the prominent smelters.

"Nothing material, I guess."

"But is it cheaper to haul the ores out than to haul in the coke and haul out the product?"

"No, not that I know of, but it is a question of rates. If the roads will haul ores to Pueblo for $5 a ton, and it takes two tons of high grade lead ore to make one ton of bullion and they charge $18 a ton to haul the bullion that far east, there is clearly an advantage in hauling out the ores, leaving out of view the hauling in of fuel. But they can't haul ores from here to Pueblo for $5 a ton without losing money."

"Isn't the Union Pacific hauling ores from Park City to Denver cheaper than they will to Salt Lake?"

"No, they are not. The whole thing is a spurt, and for what purpose I don't know. They have taken out of here a few hundred tons of siliceous ores that they were willing to give more for in Kansas City and Colorado than we are. Kansas City got enough of it, it is said, with one lot, and at a certain smelter in Colorado there are 2,000 tons of the same kind of Utah ores now lying in the yard."

"But isn't there something threatening to our smelting interests in the consolidation of the Grant smelter and the Omaha smelter, the two largest ore-reducing concerns in the country, with railroad men, as it is said, interested in them?"

"Maybe, but probably not. Omaha has not bought any Utah ores for two years, and the inference is that it wouldn't pay. I don't think either road will find it a paying business in the long run to haul ores over the mountains at a loss."

"But is it, for a fact, cheaper to haul the ores to Denver or Omaha than to haul out the coke and haul back the bullion?"

"It depends on circumstances and conditions so completely that I cannot answer offhand. But if it is, it is curious that it has not been discovered before. It is mainly a question of rates, as I said before, although railroads cannot permanently fix rates against facts; that is, against economic conditions. We have lately doubled our smelting capacity, and we did it without a tremor. I have no idea that the smelting of half the continent can be concentrated at Denver, or Omaha, or anywhere else. There is a little disturbance at present, but it is not likely to last a great while, I think."

INDIAN RECORDS.—The Plumas *National* says: "A mile or so from the celebrated Four Hills mine, near Eureka, is a very large cropping of iron ore, which belongs to the Mohawk company, and in one place the ore, nearly pure, crops out some thirty feet high. It is soft and easily cut, and from appearances has been used for many generations by the Indians as a record book of passing events, and a means of communication. It is covered with rude pictures of animals—deer, bear, etc.—and now and then men and dogs figure extensively in the 'map.' Hieroglyphics which are, of course, unintelligible, cover large portions of the croppings, and mixed with these can be found names of prospectors who left their mark twenty years or more ago. It is an interesting place, and our informant says, it is well worth a trip up there to see it." In Meadow Lake District, Nevada county, California, there is a place where there are on the rocks many curious pictures and hieroglyphics.

Ore at Great Depth in Eureka District.

More than three years ago the machinery on the old shaft of the Eureka Con. proved unable to handle the water which came in on the 1400 level—the lowest depth which had been attained. The indications were, when the miners were driven out by the water, that there was ore in quantity and quality to prospect for, and that if the trouble from water could be overcome there would be found a mine as extensive and valuable, if not more extensive and valuable, below than had been developed above. It was determined by the bold and sagacious managers of the company's affairs that a problem was presented which they could solve, having the conditions given. Solved already in their minds as definitely as any problem in mines can be solved, they resolved to test their judgment by explorations. They made up their minds to prove what they believed to be true, that the ore in the Eureka Con. extends below the water level; that the mine is permanent and contains ore bodies which make down to an indefinite depth.

The Locan Shaft.

The new shaft, named Locan after the genial and shrewd President of the company, was projected and work started over three years ago. At least $700,000 was spent in erecting large hoisting works and putting up immense hydraulic machinery. The most of the expense was paid out of surplus money in the company's treasury, reserved for the purpose, two recent assessments having been collected to aid in the enterprise, there being a third assessment levied but not yet collected. The Locan shaft, in order to gain in depth, was started considerably below the old shaft. Neither the splendid history of the mine nor the details of this latter enterprise need now be recounted. They are familiar to all who pay any attention to mining affairs, not only here, but throughout the commercial world. At the new works the shaft was sunk to a depth of 1,200 feet. Drifting towards where it was calculated the ledge would be found was begun. Progress was reported at short intervals. Our people were on tiptoe awaiting the result.

Pro and Con.

Should the calculations of the Eureka Con. directors prove incorrect and no ore be found in the drift, everybody was ready to be disappointed and put on the best face possible. Then it would have to be admitted as probable, though not altogether proved, that the Ruby Hill mines would have to be honey-combed to a few hundred feet below the surface and deserted; that such time is near at hand, for it cannot be denied that, though there is considerable virgin ground in the Eureka Con. and Richmond, the principal mines on the Hill, from the surface to, say 1,200 feet below, the best of the ore deposits have been pretty well taken out. Should these mines turn out shallow, and the experiment in the Eureka Con. prove a failure, we would have to depend upon numerous smaller mines, worked from the grass roots to a depth of only several hundred feet; unless in the distant future another veritable bonanza should be found and encourage its lucky owners to try another such experiment.

On the other hand, should the explorations in the Locan shaft bring out what its projectors calculated—should ore be found in the drift from the 1200—the mine itself would be proved of incalculable value; the result would establish the permanency of the Ruby Hill lode; it would insure the life and prosperity of Eureka on a stable and broader scale for a great many years; it would revive mining on Ruby Hill; timid capital would acquire new spirit; the Richmond Co. would feel warranted in making an outlay similar to that of the Eureka Con.; prospecting would be resumed, and the number of men employed on day's pay be enlarged to what it used to be in the bonanza days of these properties; mining throughout the entire district would be renewed with ardor and confidence; real estate values would climb back to former figures or mount beyond; money would be plentiful, and the cry of hard times and shrinkage be heard no more on the Base Range.

The Outcome.

We believe that we are on the eve of all the happy expectations that are based upon explorations through the Eureka Con. new shaft. Ore has been found. It is an extensive body, and known to be widening with depth. We are not at liberty to give the measurement, but we can say that the development is such as to gratify, for the present, those who anticipated the most splendid results.

The Strike.

The strike occurred last Friday night at 11 o'clock. We have a specimen of the ore taken from the ledge that assays $40.10 in silver and gold. The drift struck the ledge at a distance of 300 feet southwest. It had been calculated that the ledge would be struck somewhere between 300 and 350 feet. The ledge where struck was found dipping at an angle of sixty degrees to the northeast and running northwest and southeast. When the ledge was cut indications of water were discovered, and as there were no preparations at that time to handle an increased flow of water, a drift was started along the eastern wall of the ledge in a northwesterly direction, with the intention of crosscutting every 100 feet. Samples of ore taken from the ledge in the workings opened assayed from $13 to $40 per ton. The depth at which the ledge was run into is 166 feet deeper than the lowest level, the 14th, of the old mine. The flow of water at present, we learn, is not more than ten gallons per minute. Whatever flow may occur will be easily managed by the mammoth machinery constructed with reference to handling the greatest quantity that might occur.

More definite results must be watched for. Whether there is a bonanza in sight or not is certainly of importance, but the grand result is reached. There is ore deep down—166 feet deeper than ever prospected for before.

Soda Lake Mines.

At frequent intervals within the past two months it has been reported that rich discoveries of silver ledges had been made in the vicinity of Soda Lake, about sixty miles east of here. The fortunate discoverer of these ledges was reported to have been a prospector by the name of P. M. Livingston. It seems that he has kept the exact location of the ledges a secret, and although several parties endeavored to find the spot, they failed in the attempt. Mr. Livingston is a cabinetmaker by trade, and having worked many years at the same without accumulating anything beyond a moderate living, came to the conclusion about a year ago that he would make a fortune in some way, or "die in the attempt." All the various avenues for money making passed in review before his mind, but among them all he came to the conclusion that mining was the quickest and surest way of making a fortune. No sooner had he came to that conclusion than he immediately made all the necessary preparations for a long prospecting tour. Providing for the comforts of his family during his absence, he started fourth to discover some of the hidden treasures in the earth. Hearing of rich strikes in San Bernardino county, he prospected in the districts in this part of the county, but all he could find was many monuments, so he continued his course further east, until one day he discovered mineral near Soda Lake, up in the mountains where no signs of the indefatigable prospector could be seen. This discovery thrilled him with joy, and hope unfolded to his expectant mind a vision of future wealth and happiness. Keeping the discovery a secret, he proceeded to prospect the ledge, and the longer he worked, the more he thought it was rich. Taking a number of specimens to Hawley's station, he had them assayed by Mr. Gould, of the Alhambra mill. They were so rich that Mr. Gould and Lieut. Gov. Daggett were very desirous to know where they had been found; but Livingston was quite reticent on that point. Finally, for a certain consideration, the Governor and Mr. Gould were given an interest in the ledge which Livingston had discovered, and they sent a man out there with him to assist in opening the mine. They prospected carefully for a couple of months, which resulted in the sinking of a shaft about five feet, and the taking out of eight sacks of ore that assays very high, and which was shipped to S. P. Holden, ore buyer of San Francisco, week before last.

The above claim is situated high up in the mountains, about two miles from a good spring of water. The ledge is said to have regular walls, and is well defined. It will require considerable work on the same to determine whether it is the beginning of an extensive and rich deposit. For the sake of Mr. Livingston, who is a worthy and industrious citizen, we hope he is on the road to fortune, and that all who are interested in this prospect will share with him the same when it is realized.—*Calico Print.*

Borax Business.

Several months ago some large deposits of borate of lime were discovered in east Calico, portions of which were sold to Wm. T. Coleman & Co., of San Francisco, for several thousand dollars. These sales created considerable excitement in the district, and a number of parties started out in all directions to search for similar deposits. For awhile "borax" was the common topic of conversation. But no important discoveries were made of this article since the above mentioned sales. Judging from what we can learn concerning the nature, supply, and demand for borate of lime and borate of soda, we think that the ideas of most prospectors in search of this substance are considerably exaggerated, and that there is not so much money to be made out of the sale of borax in its crude state, or the manufacture of the same for commercial uses, as is generally supposed. The supply of this article is very great, as it is extensively found in Southern California, Nevada, and other regions, but the demand is exceedingly limited. In fact, the market is already glutted and a decline in the market is expected at any day. For prospectors to spend their time looking for borax deposits when the chances of selling them are so meager is to engage in an unprofitable undertaking. If large deposits should be discovered it would not pay to manufacture the borax, for the forcing of an excess of production on the market would reduce the price so low that it would be unprofitable. Some think that boracic acid is very valuable because it is worth about fifty cents a pound, but it must be taken into consideration that it has no market on account of the few uses for which it is needed.—*Calico Print.*

WE HEAR that the extension of the Cedarburg north of the Morrell, is showing up some good milling ore. Greenwood mining district bids fair to experience a healthy revival in gold mining. The Morrell has already come to the front, and favorable reports continue to come from developments now going on in other mines.

California Petroleum.

The following is from the Santa Barbara *Press*:

"What do you think of the proposition announced in the Los Angeles papers of supplying that city with fuel from the petroleum wells near Newhall?" asked a *Press* representative of Col. James H. Swift this morning.

"I think the effort, if made, will undoubtedly prove a success, replied Mr. Swift, who is a reliable authority on petroleum and asphaltum affairs in Southern California; "and not only a success in Los Angeles, but in all other portions of these southern counties, and particularly in Santa Barbara."

"What of Santa Barbara? Has it not all the fuel it requires for years in its scattered live-oak groves?"

"This is what I mean about Santa Barbara. I am speaking not of the present, but of the future. We have right here within a few miles of where we now stand the largest and finest deposit of coal oil on the Pacific coast. This city is built upon a strata of flowing petroleum, and within a few years the export of crude oil from this country will be its principal and most profitable business."

The Reason Why.

"How is it, if your assertions are correct, Mr. Swift, that the oil deposit here is not being developed, while at Ventura and at the Pico wells, near Newhall, large quantities are being pumped and marketed?"

"Because we have not yet made the proper effort. The time is fast approaching when pipes will be laid from the oil wells in the mountains, between Montecito and Carpinteria, to the seashore, where wharves will be arranged for barreling and shipping the crude oil to all portions of the coast. There is a flow of petroleum from dozens of springs not far from the coast, which is now going to waste, which might be made profitable now."

"Could the crude petroleum from these springs you speak of be as conveniently transferred by means of pipes to the seashore as it can at Ventura from the oil wells above?"

"Yes, and much more so. I can lay a pipe from these oil wells I speak of a distance of four miles, and run a ceaseless stream of oil to the Carpinteria wharf; or, by laying a pipe to the Matanza place at Ortega hill from the springs above, I can send down oil from the mountain canyon,

A Fall of 2,000 Feet,

In a distance of seven miles. At Ventura they have to pump their oil a distance of from twelve to twenty miles to the wharf. Here at Santa Barbara the oil would flow by natural gravitation down to a shipping point on the seashore."

"Is there any question as to the existence of coal oil in large quantities—large enough say to justify the construction of work and laying pipes?"

There is no question whatever, as Santa Barbara is not only in the center of a well defined coal oil belt, but the lower end of the belt opens into the ocean near Dos Pueblos rancho, between this city and Point Conception. There the surface of the waters of Santa Barbara channel is covered at all times with a film of coal oil which can be seen from the decks of passing vessels at almost all times, while upon the shore and beneath the water large deposits of asphaltum can be seen. This is the lower or western end of

The Coal Oil Belt

Which runs through these coast mountains. I have traced the oil belt from near the wells up near Newhall, on the edge of Los Angeles county, through Ventura and Santa Berbara, a distance of more than sixty miles to where the oil is discovered wasting itself in the waters of the ocean not far from Hollister's ranch."

"Why do you consider the oil wells near to Santa Barbara the best portion of this long extended deposit of petroleum?"

"Because it is near to the surface, flows stronger and can be saved and marketed cheaper and in larger quantities than at any other point. I have visited all the canyons in these mountains exploring for oil indications, and know whereof I speak. I can take you by a drive of a few miles from Santa Barbara where you can see a stream of crude petroleum as large as your hand flowing out of the earth by the side of the mountain, and in the vicinity of this at least a dozen more springs of oil, while thousands of tons of asphaltum can be had for the hauling. As I said before, a two-inch pipe laid upon the top of the ground will send a steady two-inch stream of crude oil to the seashore from these undeveloped oil regions, and as I before asserted, the coast

Oil Resources of Santa Barbara

Will make this the principal source of fuel supply in the State. Coal oil is the forthcoming fuel for this timberless region, and we have inexhaustible quantities of it which will load itself into tanks on the beach without pumping."

Mr. Swift has spent a large amount of time and money in petroleum investigations near here, and his confident assertions are the result of practical experience. He is the head of a local company organized for boring for oil some years ago, which has suspended operations for the want of capital to prosecute the work. When these operations are resumed, Santa Barbara may count upon some interesting and profitable developments.

USEFUL INFORMATION.

A New Source of Albumen.

Albumen is a substance indispensable in many processes of manufacturing. It is among the most nutritive properties of beef and vegetables, but almost the only source from which it has hitherto been obtained as a merchantable commodity is the hen's egg, the "white" being pure albumen. In supplying the demands of commerce for this article the barnyards of France have been taxed to the utmost. As eggs are rarely found in other countries beyond the local requirements for food, very naturally the cost of albumen to the consumer is high, ranging from $1.25 to $2.40 per pound, and the trade is commonly supposed to yield enormous profits. The scarcity of this indispensable commodity has set scientists at work to discover some new source for its supply; and we have recently seen it asserted that Prof. Uno H. Hellman, a Scandinavian chemist, has discovered a process of producing albumen in unlimited quantities from an entirely new source, and one which is literally as broad as the ocean. The source referred to is the spawn of fish, so that our cod, menhaden and shad fisheries are to contribute additional wealth from their hitherto waste products. It is predicted that these interests must ultimately receive an immense impetus from increased profits, and that the United States Fisheries Commission will find an incentive for doubling its efforts in fish propagation. Extensive works are in course of erection on the Massachusetts coast, and the United States Albumen Mfg. Co., who own the exclusive right to manufacture albumen and all its products from the spawn or ova of fish, expect soon to begin operations on an extensive scale. Their capital of $300,000 is said to be in strong hands. The process is simply to separate the spawn from the inclosing membrane, crush it in machinery, and the albumenous water resulting is boiled in a vacuum at a temperature not exceeding 115° F. Albumen is consumed on a large scale in cotton mills, print works, by manufacturers of fine stationery, and in many of the arts. A process which promises to reduce the cost more than one half is of some importance.

SCRAPINGS OF HORN.—The fine scrapings of any common cattle's horn steeped in vinegar and bound hot as can be borne upon a wound will subdue pain almost instantly, and effectually subdue lockjaw. I have often used this remedy, and have never had a failure. In wounds torn and lacerated, as for example, where a nail has been stepped on penetrating the sole of the foot, and the patient wild with pain, countenance livid, teeth chattering, limbs trembling and lockjaw seeming inevitable, with this remedy I have produced perfect quiet, relaxation of muscles and freedom from pain, and even from soreness of the wound, in the space of 15 minutes time. I was called in haste to see a young man of 15 years who had stepped on a nail. I found him almost in spasms and had no remedies with me. In the house I found a powder horn, and with a piece of glass went to scraping. As soon as I had a common thimbleful I barely covered it with vinegar and heated it as hot as could be borne, and, setting others to scraping, I applied it to the wound, changed often as soon as cool, adding the scraping accumulated, and with this treatment had the boy easy and out of danger in 15 minutes. I know not what there is in horn that produces this effect, which I have seen many times, and have often wished there might be some preparation of this remedy a little more convenient to use than the crude material.

A USEFUL KIND OF SOLDER.—A soft alloy which attaches itself so firmly to the surface of metals, glass and porcelain that it can be employed to solder articles that will not bear a very high temperature can be made as follows: Copper dust obtained by precipitation from a solution of the sulphate by means of zinc is put in a cast iron or porcelain lined mortar and mixed with strong sulphuric acid, specific gravity 1.85. From 20 to 30 or 36 parts of the copper are taken, according to the hardness desired. To the cake formed of acid and copper there is added, under constant stirring, 70 parts of mercury. When well mixed, the amalgam is carefully rinsed with warm water to remove all the acid, and then set aside to cool. In 10 or 12 hours it is hard enough to scratch tin. If it is to be used now, it must be heated so hot that when worked over and brayed in an iron mortar it becomes as soft as wax. In this ductile form it can be spread out on any surface, to which it adheres when it gets cold and hard.—*Amateur Mechanics.*

A CHEMICAL FOOD PRESERVATIVE. — For many years chemists and others have sought in vain for some compound which possessed the property of preserving food substances without injuring them as foods. The long-sought article seems to have been found at last in a new compound known as boro-glyceride. The compound is made by dissolving boracic acid in glycerine by the aid of heat. About three parts of glycerine and two of boracic acid are the proportions required. The boro-glyceride is dissolved in fifty parts, by weight, of water, and is then ready for use. The discoverer claims to have preserved fish, eggs, meat and various other foods for more than three months by simply immersing them in the solution, which may be used repeatedly, as it is not absorbed by the food substances immersed in it. We cannot as yet speak from experience, but we believe this is a safe preservative agent, at least for such foods as eggs and butter, and perhaps for some perishable fruits and vegetables. We shall experiment with the article this summer, and report the result.

WHAT MAKES CORN POP.—Chemists who have examined Indian corn find that it contains all the way from six to eleven parts in a hundred (by weight) of fat. By proper means this fat can be separated from the grain, and it is then a thick, pale oil. When oils are heated sufficiently in closed vessels so that the air cannot get to them they are turned into gas, which occupies many times the bulk that the oil did. When pop corn is gradually heated and made so hot that the oil inside the kernels turn to gas, this gas cannot escape through the hull of the kernels, but when the interior pressure gets strong enough it bursts the grain, and the explosion is so violent that it shatters it in the most curious manner. The starch in the grain becomes cooked and takes up a great deal more space than it did before.

SWEATING OF VARNISH.—Varnish is liable to "sweat"—that is, to have a glossy appearance after it has been rubbed and allowed to stand a while, whenever the coat has been applied too heavy and has not dried through, or if too much rubbing is done. The rubbing coat is too often applied carelessly, with the thought that all defects, such as specks and brush marks, will be rubbed out, but this necessitates so long a rubbing that the life of the varnish is destroyed, and sweating then follows. However, sweating is of little moment in the hands of an experienced workman, for he will rub the job and put the varnish on before it has time to sweat.

CANARY BIRDS are natives of the Canary Islands. The native bird differs materially from these we now have in cages. It is not as large, and the color of its plumage is somewhat different. The original stock is said to have been imported from the Canary Islands about the fourteenth century. There are about fifty varieties of this bird.

ACCORDING to Weidemann, a shark belonging to the genus *Scyllium* is phosphorescent on its whole under surface, with the exception of a black stripe on the neck. The upper surface is non-luminous.

GOOD HEALTH.

Regulating Diet.

The human body is exhausted of its elements day by day very much as a piece of cultivated land is from year to year. But the required proportions of these elements change with the seasons and weather. We should neither eat the same quantity nor the same kind of food in July as in January. All food contains two principles—carbon to produce heat, and nitrogen to build up muscle. Those who work hard require much nurishment of nitrogenous character to build up muscle; those who are exposed to much cold require much carbonaceous or heat-supplying food. Greenlanders crave for fat and oil, while people of tropical climates have a natural craving for fruits. Says the *Journal of Health:* "A wise man will take but little carbonaceous food on a suddenly hot day, but if suddenly cold, he will eat pleutifully of fuel-making food. An infinite number of fevers and cold would be avoided if timely attention were paid to these things. By the aid of these statements, the following tables may be used to great advantage, showing the amount of carbon or of heat-producing principle in several articles of food. There is not one per cent of nitrogen, of flesh-forming prineiple, in fruits, berries, and the more common vegetables. Meats have about fiftcen per cent. The meats average twenty-five per cent of nuitriment—that is, including both carbon and nitrogen. Of all meats, mutton is the most nutritious, thirty per cent; fish least, twenty per cent. Of all vegetables, white beans are the most nutritious, ninety-five per cent; wheat flour, ninety per cent; turnips, the least, five per cent. Of fruits, plums are the most nutritious, thirty per cent; apples, seventeen; melons and cucumbers, three; the rest being mere water and waste. The more waste, the more open the bowels are. The following table shows the percentage of carbon:

Apricots.....	0	Potatoes.....	11
Berries.....	0	Lean Meat....	13
Cherries.....	0	Rye Bread....	31
Currants.....	0	Gum Arabic..	36
Turnips.....	3	Arrow Root ..	36

Blood.....	10	Starch.....	37
Milk.....	10	Lentils.....	37
Wheat Bread..	40		
Sugar.....	42		
Apples.....	45		
Fat Meats....	53		
Butter.....	65		
Soup.....	75		
Lard.....	80		
Beans.....	88		

SLEEP.—Men, women and children require just so much sleep, and if they do not have it, suffer in consequence. I do not think a person should be waked in the morning, and for this reason, when a man falls asleep, he is in the shop for repairs, as the railroad men say. His frame and all its intricate machinery is being overhauled and made ready for the next day's work. The wear of the previous day is being repaired. Nature is doing that herself. She knows what the tired frame needs just as she knows how to make the heart throb and send the blood coursing through the veins. Then she takes that tired frame, lays it down on a bed, surrounds it with the refreshing air of night, covers it with the soft darkness and lets the man rest. "Tired nature's sweet restorer, balmy sleep," visits him, and as the hours wear by his energies are renewed, his strength comes back, and finally, when morning breaks and the sunlight steals through the lattice, he opens his eyes and is himself again. Or, if he is early to bed, he awakes with the cocks crowing. Now, who shall go to that man's side an hour before he opens his eyes, and say to nature, stand aside and let him get up; he has had enough of rest? Well, nature will say: "You can take him if you will, but I will charge him with an hour's loss of sleep, and I'll collect it out of his bones and nerves and his hair and eyesight. You can't cheat me. I'll find property to levy on!"—*Journal of Health.*

POISONED BY HANDLING HIDES.—In New York City, a short time ago, a man died from poison, communicated while handling some buffalo hides sent from India. His companion worker employed on the same job was taken sick, and after a severe illness finally recovered. Both the men became warm, perspired freely, and repeatedly wiped the sweat from their faces with the bare hand, each of the men having a pimple on the face. Whether the death of the one and the illness of the other was caused by the virus from the hide of a diseased animal, or by the absorption of arsenic used in the preservation of the hides, is not positively known. Probably, however, the cause was disease communicated from an infected animal through its hide, as the Calcutta packers use, frequently, an arsenical preparation on the hides to kill a small brown worm that otherwise might destroy the hides, and instances of poisoning in handling these hides are not uncommon. Some years ago an importer of hides in New York died from the effects of a bite or sting of a fly which inhabited the loft where the hides were stored.

BEEF tea has small nutritive value. It may be taken lukewarm, or cold, or iced. Too great a quantity need not be made at once; nor is there any particular advantage to be gained by making it so particularly good and strong, as some persons imagine. The prevaleut impressions about beef tea show how little real knowledge exists about our food as regards our requirements. Beef tea is a stimulant rather than a food. A person may be hungered to death on it. It is a pleasaut, palatable, refreshing beverage when well made. As a vehicle for farinaceous matters, or with a teaspoonful of cream in it, it is useful as a food. Liebig's extract, and the other extracts, are all pleasant beverages, and may be taken hot, lukewarm, or cold, or iced, as occasion requires, or the taste of the patient directs. Preparations of meat juice are in the market, which are very suitable for the invalid. Then mutton may be used, or chicken, or mixed meat. All these are useful; or the patient may prefer eel broth.

POISONING BY CHEESE.—Several persons of Lynn, Mass., were recently poisoned by eating cheese. The eminent chemist, Prof. Bowker, of Boston, analyzed samples of the cheese, and reports that he finds no "foreign fats or substance not found in natural cheese." The chemist suggests that the ill-effects arising from eating the cheese were due to some animal poison, which eludes detection by chemical analysis. Cases of poisoning by cheese are very common. We have long held the opinion that this article ought to be discarded altogether as a food substance. It is a wonder to us that the number of cases of poisoning from the eating of cheese is not much greater. We have often seen persons eating cheese in which the formation of mold was so extensive as to give the cheese the appearance of having been thoroughly penetrated by a moss-like growth.—*Good Health.*

POISONOUS ROUGE.—A girl named Hernals was found lying insensible near a Vienna hospital a short time ago. She was breathing, but to all appearance dead. On being taken to the hospital, the doctors pronounced the case to be one of poisoning. When brought to herself again, she declared that after the sparing use of some new rouge, a strange sensation came over her, and she told her mother she must go out for a little air. On reaching the hospital she fainted, and was found in that condition. The rouge being examined, was found to contain several poisonous ingredients, and no doubt has been the cause of many deaths.

OLD POTATOES.—Those who eat this vegetable should avoid both old potatoes and those which are new and unripe. It ought to be known and remembered, just at this time, that both old and unripe potatoes contain a poisonous substance known as *solanine*. Potatoes which have begun to sprout are certain to contain a quantity of this poison, and hence should be avoided, unless very great care is taken to remove the sprouts very perfectly, and then they are better buried than eaten.

A NEW DISEASE.—It is recently reported that a disease of a very peculiar nature has made its appearance in New South Wales. Persons affected with it exhibit symptoms very similar to those of hydrophobia. The malady is attributed to the use of the flesh of sheep infected with parasites.

PHYSICIANS say that ginger ale is a poor substitute for water, because the capsicum it contains irritates the lining of the stomach and produces dangerous inflammation.

Passing Events.

The great Triennial Conclave is over, and most of the visiting Knights have departed after having thoroughly enjoyed themselves at the various entertainments and excursions arranged for their pleasure.

A great many claims have been located of late in the San Gabriel mountains in this State, where a new mining district has been laid out.

The Northern Pacific railroad, the completion of which is now announced, will open up a large area of mining ground heretofore lacking the means of transportation. The season is now so late that the benefits of the road will not be shown up in this connection before next summer. Our northwestern Territories have such severe winters that only the best equipped mines can be worked during the winter months.

The Denver Mineral exposition seems to have been a failure, as there is a general disposition to withdraw the exhibits, which, however, is not permitted by the managers. There has been a very slim attendance since the opening.

THE Hollister *Democrat* says of the recently discovered gold mines in the Gabilan mountains, thirty-five mining claims have already been located, and others are being located daily. Three shafts and one tunnel have already been opened, and the quality of the ore improves as work advances.

The Virginia *Chronicle* says: "It is said that the Overman Mining company contemplate buying the old Petaluma mill, in order to work the ore at present being extracted from the croppings by means of a tunnel near the old Overman works, on Petaluma street."

Temperature of Rocks.

According to the evidence of the members of a Parliamentary Commission of Great Britain for inquiring as to the possible depth of coal mining, the temperature of the strata in horizontal coal workings accords with the rise and fall of the surface above; but there is reason to believe that this rule will only apply to gradual variations of surface, and not to abrupt prominences in the nature of peaks, since in the Mt. Cenis tunnel the temperature of the rock is very much less than would be due to the depth measured from the top of the mountain. It may, however, be assumed that under the ordinary configuration of the surface the increase of temperature will have reference to the depth from the surface of the ground, and not from the level of the sea. High temperature of the strata operates as an impediment to deep working by heating the air circulating through the passages of the mine. When cool air enters a heated mine it absorbs heat from the surfaces of the passages through which it flows, and the rate of this absorption somewhat exceeds the ratio of the difference between the temperature of the air and that of the surrounding surface with which it is in contact.

By the absorption which thus takes place the air is heated, and this heating process is most rapid at first when the difference of temperature is greatest, and gradually diminishes as the length of the passage is extended, never ceasing until complete assimilation of temperature is effected. The progress towards assimilation of temperature is much more rapid when the air comes in contact with the working face of the coal, which from being nearly exposed is more highly heated than the surfaces of the permanent air courses. The rapidity, however, with which the air takes up the heat from the working face depends, in a great degree, upon the system of working. In the celebrated system called "Pillow and Stall," the air seems to acquire almost immediately the full temperature of the coal. But under the "Long Wall" system there are instances of the air retaining a considerable inferiority of temperature after sweeping past the working face. The great outlay of sinking pits to coal lying at extreme depths, would render it necessary to work a large area of coal for each sinking, and this would involve air courses of great length. It thus becomes necessary to consider the question of ventilation under the double aspect of great depth from surface and great length of air passages.

Mineral Land and Agricultural Claims.

It is often stated that such and such a ranch is more valuable for its mineral than agricultural land, and ought never have been taken up as a farm. But in fraudulent proceedings under agricultural claims, to obtain title to mineral lands, it is obvious that no broad rule can be arbitrarily enforced under the present laws. Land which is, in fact, non-mineral, is subject to agricultural entry; and if a person seeks under such entry to obtain title to a mineral tract, it is the duty of miners and others who may know its real character to appear at the District Land Office and submit proof of the facts. The knowledge of the character of any certain tract is local, and the Land Office must necessarily depend on parties in the immediate vicinity to prevent fraud. Published notice of thirty days is required of parties who seek agricultural entry on lands withdrawn as mineral, and everyone is thus advised and given an opportunity to defeat fraudulent entry.

If under the present laws those interested in preventing fraudulent entries will avail themselves of the means furnished by existing regulations, and appear and insist on their right to submit their testimony at the hearings, and notify the U. S. General Land Office of any refusal to receive testimony, or irregularity of proceedings, a just conclusion can usually be reached; but without the co-operation of those interested in an honest disposition of the public lands, it is apparent that the Land Office labors under great embarrassment. Any citizen has the right to go and offer testimony to prove the land is more valuable for mineral than for agricultural purposes.

LAST week 19,000 pounds of machinery arrived at the depot for the gold quartz mill at Camp Cady. In a few days the engine and other machinery will arrive. In about a month the mill will be in operation.—*Calico Print.*

Mono County Minerals.

Mono county has two cases of minerals at the State Mining Bureau, which were sent by the county for exhibition here during the Conclave, and they will be kept here. Among those things of interest are the following: Fine grained diorite, from Mineral Hill. There is a slide with this for microscopic examination. Pyrargyrite and Proustite crystals in quartz from Oro mine, Bodie; tufa from Sulphur Springs; salt from the Inyo range, forty miles from Independence, and near Benton; presented by J. H. Crossman. Pumice stone. Obisidian from near Mono lake, Melville Attwood; galena from May Lundy mine, Homer district. Azurite with malactite and cuprite from Kessick mine, Benton, J. M. Classen. Gold on quartz crystal, Beveridge district, J. H. Holt. The gold has the appearance of having been formed in the crystal, but close inspection shows that it is cemented on the outside by oxide of iron. Quartz crystals doubly terminated, Standard mine, Bodie. Porphyry, footwall of Standard mine. Molybdenite, Minnie mine, Sweetwater range. Native silver in partzite, Camanche mine, Blind Springs, Joseph Wasson. Thinolite—several specimens and very interesting. This is a travertine—carbonate of lime—which deposits from the supersaturated solutions from the alkaline lakes of the great basin. Great abundance at the different lakes. It forms immense masses, and they burn it now for lime. Clarence King named it some years since. Clay slate bored by worms, Mono lake. Altered quartzose, trachytic diorite, the feldspar mostly sanidine, hanging wall, Standard mine. Fine grained diorite (with microscopic section). Dolerite, east wall Camanche mine.

There are numerous specimens of gold quartz from the mines of Bodie district contributed by Jno. F. Boyd, J. H. Redmond, W. P. Jenney, Wm. M. Lent and Joseph Wasson. With these are specimens of red float rock, cap rock, etc. Silver ore from Prescott district, J. Casarello; galena from Homer M. and M. Co.; silver ore from Benton district, from Gray Eagle mine; silver ores from Bodie, from E. B. Haft, John Dixon and H. M. Levy; silver ore from Ahuaga mine, summit of Sierra Nevada, 1½ miles northwest of Mt. Dana; silver ore from Prescott district, Bloody canyon; also from Golden Crown mine, head of same canyon. There is one complete set of ores from the lower levels of the Oro gold and silver mine, Bodie, specially interesting as resembling the ores of the Comstock.

Argentiferous galena (with bleude and glocronite) from Garibaldi mine, Prescott district, from J. Casarello. Silver ore from Camanche mine, from H. M. Levy. There are samples of water from Mono lake, and from near Bridgeport, the latter spring having deposited a very large quantity of Aragonite or calcite. Copper from Detroit mine, Jordan district, A. J. Howk. From Patterson district there are quite a number of specimens, the following mines being represented: East Lookout, Great Western, Magnolia, North Lookout, Silverado, Kentuck, Daisy, Homestake, Omega and Poverty. The May Lundy sends some of its peculiar, but rich ore. Gold ore from Porcupine mine, Lundy, from Mr. LeMoine. Silver ore, Ella Blossom mine, Prescott district. Horn silver from Kentucky mine, Sweetwater. Copper from the Monmouth mine, J. F. Johnson. Variegated obsidian, McBride's ranch, J. M. Graham. Iron ore (magnetite), Solid Iron mine, Indian district, from D. P. Tarpy. An analysis shows this to contain peroxide of iron, 93.00; silica, 7.00, with traces of graphite and sulphide of copper.

There is a specimen of the lava which exists in immense quantities on the borders of Mono lake. Owens river cuts through this formation in a deep canyon. It is easily decomposed, and supposed to yield the soda salts so abundant in that region. It also crops out at Adobe meadows. This county shows up well in its mineral productions, but there are many more mines which should be represented.

CARSON FOOTPRINTS.—In the MINING AND SCIENTIFIC PRESS of Aug. 18th appeared an article on the Carson Footprints, which was read before the California Academy of Sciences by Dr. H. W. Harkness, who made the original investigations on the subject, and whose first paper was widely read and commented on. In the late article to which we refer, Dr. Harkness' name was accidentally omitted.

Testing Gold Sands.

As a general proposition, the results of assays of gold ore are not as satisfactory or reliable as those made for silver. The ordinary fire assay for gold, especially if the ore be of low grade, cannot be relied on. Very great care has to be exercised in the selection of the sample in the first place, and the amount of gold is so minute that only delicate manipulation will properly save and weigh it. The finest of balances with nice adjustment are required; and, altogether, when the whole is considered, miners of experience would rather judge from the results of "horning," or panning out a good liberal sample of ore properly pulverized. They can tell by the "colors" about what the ore will yield at the mill. In assaying gold ore by the blowpipe, the results depend greatly on the operator's skill, and his judgment in the selection of samples.

In assaying the gold sand of the rivers, streams and sea beaches of this coast, some difficulty is met with. It contains a great amount of specular and titanic iron, and is called "black sand." by the miners. Platinum and iridium are often found in the same sand. Mr. George Attwood, in his "Blowpipe Assaying," gives a convenient method of testing these sands:

"Take 100 to 1,000 grains, and attack with *aqua regia* in a flask; cool for about thirty minutes or more; dilute with water and filter. If gold is present it will now be held in solution in the filtrate. Remove the filter and evaporate the filtrates to dryness; then add a little hydrochloric acid and redissolve the dry salt in warm water; add to the solution so formed protosulphate of iron, which will throw down the gold in the form of a fine, dark precipitate. This precipitate is seldom pure, being mixed with oxides of iron, and must now be dried in the filter paper, and both burned over the lamp in a porcelain dish. Then mix the dried precipitate with three times its weight of lead; fuse, scorify and cupel. In case platinum, iridium, etc., are found associated with the gold, an extra amount of pure silver should be added before cupellation, and the gold button will be found pure."

Overwinding at Shafts.

It is noticeable that one of the most frequent causes of accident in mining operations of a few years ago has almost entirely disappeared. One of our commonest sources of fatal accidents was "overwinding" or hauling the men up into the sheaves when hoisting them out of the shaft. Of late we very seldom hear of any occurrence of the kind. It got to be so common at one time that a number of inventors set to work to apply a remedy. Many inventions were perfected to prevent overwinding, and as these have been adopted, they have accomplished the object pretty thoroughly. We have from time to time described the appliances referred to as each new one came up, and now there is no cause for any superintendent or mining company to allow employes to be hurt in this way.

Not only has this class of accidents been done away with here, but in Europe also. One of the government inspectors of mines in a very populous district in Great Britain records the fact in his annual report that not a death from overwinding has occurred in the year. This is evidence of the great care exercised by those persons having charge of the winding machines, and it also shows the wonderful control the workmen have over them, taking into account the large output and the men who are lowered and raised every day. Most of the winding arrangements have attached to them disengaging hooks for prevention of overwinding. They have, in all probability, been the means of saving property, and perhaps lives, but like all other self-acting apparatus, they require attention, frequent examination and testing. Another inspector of another district, in mentioning deaths from accidents in shafts, says the year's record is one for congratulation. About 50,000 persons ascend and descend the shafts in his district, yet there were but four deaths, and he does not register a single case of overwinding attendant with fatal consequences. Plenty of instances might be cited to show where fatalities would have occurred but for the use of detaching hooks. In order to keep the loss of life in shafts reduced, ceaseless attention and watchfulness are necessary, both as to the shafts themselves and the strength of machinery.

Blasting in Mines.—No. 6.

Line of Least Resistance

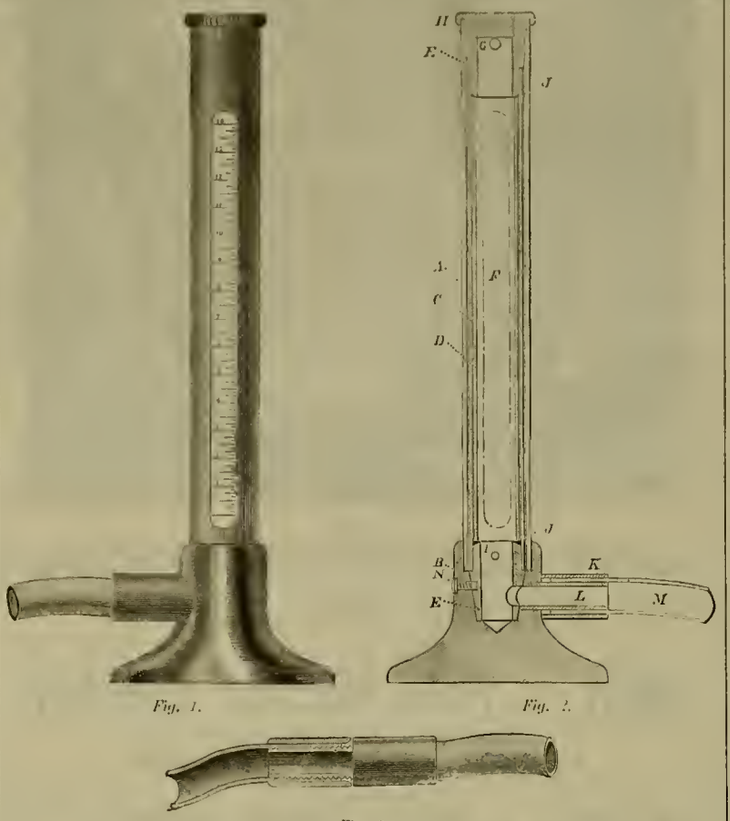
As the pressure of a fluid is exerted equally in all directions, the surrounding mass subjected to the force will yield, if it yield at all, in its weakest part, that is, the part which offers least resistance. The line along which the mass yields, or line of rupture, is called the line of least resistance, and is the distance traversed by the gases before reaching the surface. When the surrounding mass is uniformly resisting, the line of least resistance will be a straight line, and it will be the shortest distance from the center of the charge to the surface. Such, however, is rarely the case, and the line of rupture will therefore in most instances be an irregular line, and often much longer than that from the center direct to the surface. It will be obvious, on reflection, that the line of least resistance will be greatly dependent upon the texture of the rock, which may vary from one point to another; its structure, which renders it more easily cleavable in one direction than in another; the position, number, and direction of the joints which separate the rock into more or less detached portions; and the number and relative position of the unsupported faces of the rock. All of these circumstances must be ascertained, and the position of the bore hole determined in accordance with them, in order to obtain the maximum effect from a given quantity of explosive. It must not be supposed that this is a labor involving minute examination and long consideration. On the contrary, a glance is generally sufficient to enable the educated eye to estimate the value of the circumstances before mentioned, and to determine accordingly the most effective position for the hole. The ability to do this is always claimed by workmen. They can see, they say, which is the best position for the charge. To those who possess the requisite knowledge of rock structure and the action of expanding gases, the determining circumstances are certainly apparent. But in a great majority of cases, this *seeing* amounts to little more than following the rule of thumb. And if there be one operation less subject to this rule than any other, it is that of blasting, in which the conditions vary from hole to hole. The possession of such knowledge should, therefore, be deemed essential. Without it, every blast is necessarily of a tentative character; and to ensure the attainment of the end proposed in such cases, a superfluous quantity of the explosive compound is employed. Nor is this the only waste due to the same source; even by the expenditure of an additional quantity of the explosive, the work can seldom be effected without distributing this quantity among a larger number of holes. The object to be aimed at by the blaster is the accomplishment of a given quantity of work with the least labor of boring, and the least expenditure of powder. To attain this object, the first condition evidently is, to determine accurately the line of least resistance, or in other words, the most effective position for the bore hole. In practice, the line of least resistance is taken as the shortest distance from the center of the charge to the surface of the rock, unless the existence of natural divisions or differences of texture show it to lie in some other direction.

A Simple Water Lift.

What is known as a "California," or "Chinese" pump, is shown in the engraving on this page, and is a very useful device, more in vogue in early days, when placer mining was more common than now when so little of it is done. A canvas or leather belt (*b*) having short "buckets," or slats (*d*) nailed on it, revolves on a pulley (*h*) which is secured to the shaft of the drivewheel (*w*). A closed trough or box (*a*) is set on an incline into the water or pool to be drawn, and at its lower end carries a roller (*i*) around which the belt (*b*) revolves. The belt passes up the trough or box, and the buckets carry the water up, discharging at *e* into a ditch or flume. Power is derived from the water brought to the wheel by the sluice *y*. The pump can be run by hand, however, and is very frequently used that way. A simple tread power can also be used. Any one can make one of these pumps, as no metal is necessary in their construction. For lifting water for irrigating on a small scale, draining a mining claim or pool, lifting water to gain fall, etc., this style of pump does good service, more especially when the lift is not great, and the box may be set at a small incline.

Mining Debris.

The momentous questions involved in the debris controversy are exceedingly difficult of settlement. Every move towards a final agreement seems interminably long. The famous suit of Woodruff vs. the North Bloomfield mining company is still pending, not half the testimony even having been taken. The special commissioners appointed in July to take testimony in the suit have examined about 200 witnesses. The testimony covers more than 20,000 pages of legal cap, and the examiners declare they will not be able to finish within the limited



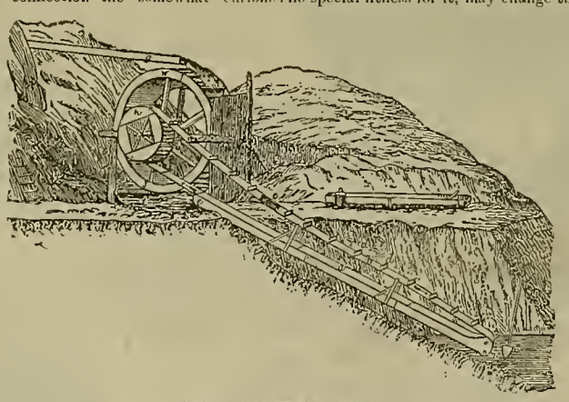


Fig. 1. *Fig. 2.*

Fig. 3.

Fig. 1. Outside View of Standard Hydrostatic Level. Fig. 2. Section of Standard. Fig. 3. Coupling for Flexible Tube. (See Article and Cut on Page 129.)

time, Sept. 11th, as the defense has produced but fifty witnesses, with the intention of calling up many more, and the plaintiff has the right to present testimony in rebuttal. More time will have to be given, of course.

In this connection the somewhat curious

THE "CHINESE" PUMP.

course of the Secretary of War, with regard to the money appropriated by Congress for the improvement of the navigation of the rivers of California, is remarkable. The trustees of the city of Sacramento, apparently considering themselves as possessing more influence than Congress, asked the Secretary of War not to use the money Congress had given for the specific purpose for which it was intended.

In answer to the request, the chief clerk of the Secretary of War telegraphs back to the Mayor and Trustees of Sacramento as follows: "Referring to your telegram of the 18th, the Secretary of War advises me that no orders for the expenditure of the appropriation for improving the Sacramento and Feather rivers will be made, unless, after careful consideration, it shall be deemed best for the public service. He says that if any action is taken it will be after his return to Washington. As at present advised, the Secretary of War does not expect to build dams without further action of Congress."

It seems strange, after Congress appropriates a certain sum for a certain purpose, first appointing competent engineers to report on the subject, and carefully considering it, that any individual, no matter who he may be, can nullify the whole thing. It is an arbitrary act. The Secretary of War does not know anything about the subject, yet he arrogates to himself the right to judge of a matter of vital importance which has already been decided in the opposite way by the highest tribunal of our land. That some one, never elected by the people, but simply appointed to a political position with no special fitness for it, may change the will of the people's representatives, no matter whether that will is right or wrong, seems an innovation in our Republic. If debris dams are wrong, Congress will find it out, but it is by no means in the province of the Secretary of War to find it out for that body after they have appropriated money to build them. J. B.

At the middle mines on the Comstock they have been somewhat delayed by the wearing out of the pins of the bobs of the Cornish pumps. Heretofore these pins have been rivited in, making it necessary to take off the head of the bob and take it to the surface when a pin is to be changed, as to drive out the old pin is a somewhat difficult job, but the pins now being put in are of a different pattern, and are fastened with a key instead of being rivited.

Mining in Frozen Ground.

In talking with an Alaska miner some time ago, he told us that in summer in the mineral region around Golowin bay, the ground was frozen to considerable depth, although mossy and boggy on the surface. At a depth of twenty feet in the shaft they had not got through the frozen ground. The heavy coat of moss seems to protect the ice, as ice is protected by sawdust and blankets.

Wm. R. Bentley, of this city, tells of miners working on frozen ground at very great depth. While at Rathdrum, Kootenai county, Idaho, in May last, his attention was called to a phenomenon in the vicinity, and he went out to the sawmills of L. B. Merriam, where there is a shaft 108 feet deep. From the surface down nearly 100 feet the soil is alluvial, being mostly gravel below eight feet.

At the lowest point the gravel is frozen solid. He descended the shaft and undertook to pick out portions of the wall of the shaft, but found it like cement, all of the interstices being full of ice. The shaft is cut into this frozen ground nearly ten feet, and appears alike to the bottom. The temperature at the bottom is very low, and gives one the sensation of being in an ice-house. How much further the gravel continues, Mr. Bentley is unable to state. The gravel at the bottom was like that at the top—stratification nearly horizontal. On the surface the timber is heavy fir and other evergreens.

We made mention not long since of the phenomenon at Aurora, Nevada. In the old Del Monte workings, 100 feet deep, two deserted tunnels intersect. There is a very strong draft through each tunnel, and at the point of intersection the temperature is below the freezing point. The water seeping down from the upper workings is frozen as fast as it drops at all seasons of the year.

Butte County Minerals.

In the Butte county case at the Mining Bureau in this city, which the county itself gave, are some very interesting specimens. The display does not by any means, however, properly represent Butte, and her citizens should see to it that the exhibit is increased. Mr. Louis Glass, of the Spring Valley mine, at Cherokee, sends numerous samples which illustrate hydraulic mine formations. There is a sample of the white top gravel from 20 to 400 feet thick overlying rotten bowlders; specimens of yellow or rotten bowlder stratum from one to ten feet thick overlying the gravel; blue gravel bottom stratum lying on bedrock from six to ten feet thick. Samples are shown, also, of the pyrites found in cleaning up the mine, and also of the platinum found with gold in the mine. An interesting thing is the bowl of diamondiferous sand found in cleaning up at the mine. A liberal sample is shown of the placer gold, and of the placer gold in cement; also gold amalgam before retorting, and several cakes of retorted amalgam. There are also diamonds, both cut and uncut, from the same mine. These are set in finger rings, and look exceedingly well. There is also a rough diamond weighing 180 milligrams, found in cleaning up the Spring Valley mine, by F. G. Williams. It was associated with zircons, platinum, gold and iridium. The display from this mine is very creditable indeed. Specimens from Minerva mine, loaned by W. C. Duncan. Basaltic lava showing a scale. Fragment from a bowlder of basaltic lava. The label on this specimen says it illustrates how angular fragments of rock weather into rounded bowlders without water-washing, this being convex on one side and concave on the other. Micaceous iron, from near Oroville, J. W. Collins. Chromic iron, Mount Hope district, near Forbestown, C. C. Cooledge. Asbestos, from near Oroville, R. J. Perrin. Asbestos, M. T. Blair. Asbestos, 18 miles northeast of Oroville, S. S. Sweet. This is a very fine sample. Picrolite, near Red hill. Slate from same locality. Limonite, Red hill, A. B. Paul. Bowlder of smoky quartz, H. G. Kuhl. Magnetite from near Oroville, S. W. Collins. Portion of tusk of mastodon, from Indian Spring drift mine, 320 feet below lava, A. B. Paul. From same mine, tusk of boar or peccary. Fine specimens of auriferous material from same mine. Section of jawbone of mastodon, from Magalia mine, from J. D. La Monte.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1860, C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

MANUFACTURERS OF IMPROVED AND APPROVED FORMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved Wilfe, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Olant and Old Ake Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

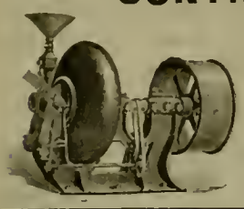
Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.



CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weighs 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING AUGUST 21, 1883.

283,693.—LAMP REFLECTOR FOR STREET CARS—E. Boesch, S. F.

283,563.—VEHICLE WHEEL—James J. Bush, Tacoma, W. T.

283,581.—MAST FOR ILLUMINATORS—P. de Saisset, San Jose, Cal.

283,583.—HAND STAMP—H. C. Dorr, S. F.

283,594.—TREE PLANTER—L. Gairaud, Santa Clara, Cal.

283,596.—PAPER FILE-HOLDER—W. W. Gilman, S. F.

283,394.—PLOW AND CULTIVATOR FRAME—F. A. Hill, Benicia, Cal.

283,493.—CLUTCH MECHANISM—M. Kraker, S. F.

283,505.—NUT LOCK—E. Odell, Elko, Nev.

283,656.—AUTOMATIC CUT-OFF FOR ENGINE—John B. Pitchford, S. F.

283,657.—PILLOW BLOCK—Jno. B. Pitchford, S. F.

283,515.—INVALID SETTEE—John Rodgers, S. F.

283,668.—ADJUSTABLE HEAD FOR MILLING MACHINE—A. Schurch, S. F.

283,519.—TAILPIECE FOR BANJOS—W. A. Scollay, S. F.

283,522.—BRETZEL CUTTER—J. U. Segesser, S. F.

283,524.—STEP LADDER—E. A. Shumway, Walnut Creek, Cal.

283,529.—CYLINDER FOR THRASHERS—A. G. Stewart, Oakland, Cal.

283,532.—BALANCE VALVE—C. F. Taylor, Chico, Cal.

283,439.—FIRE ESCAPE—W. Torst, Bingham Canyon, U. T.

283,536.—CANDLESTICK—C. B. Tuckfield, Salt Lake City, U. T.

283,541.—WHIFFLETREE—E. H. Wade, San Jose, Cal.

14,226.—DESIGN FOR VASE—Chas. Nardini, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BRETZEL CUTTER.—J. U. Segesser, S. F., Cal. No. 283,522. Dated Aug. 21, 1883. This bretzel cutter consists in a shield-like die, or stamp, provided with a double-spaced wall around its edge, in which an ejector is adapted to move, and with a hollow center crossed by radial walls, in the bottom of which grooves are made. At present bretzels are made both by hand and by machinery. The machines for accomplishing this work are constructed of two revolving impinging rollers, in the faces of each of which one-half the pattern or stamp is made. It is found by experience that by this means only the stiffest kind of dough can be used in order to prevent it from sticking to the shallow grooves of the pattern stamp, and thus occasioning loss. This entails the use of proving-boxes, in which the stiff dough, after being cut into bretzels, is placed to make it rise properly. The object of this invention is to provide a means of cutting the bretzels out of better and lighter dough which has not afterwards to rise, thus doing away with the proving-boxes, and saving much time and labor.

PILLOW BLOCKS.—John B. Pitchford, S. F. No. 283,657. Dated Aug. 21, 1883. In the ordinary construction of pillow blocks the wedges have been adjusted by screws passing through the pillow block cap and suspending them so that the cap could not be secured without moving them and disturbing the adjustment so that if the shaft were subjected to the strain of a heavy belt, or the thrust of gear, it was liable to be thrown out of gear. Mr. Pitchford's invention relates to certain improvements in these pillow blocks, and consists of a means for adjusting the quarter beams of a pillow block with reference to the shaft by means of vertically moving wedges and thumb screws, which are so arranged that the cap of the pillow block can be taken off without allowing the shaft to lose its proper position. In this device the cap can be entirely removed without in any manner disturbing the shaft in its adjusting mechanism.

CLUTCH MECHANISM.—Michael Kraker, S. F. assignor of part interest to M. Israel and O. Schmidt, same place. No. 283,493. Dated Aug. 21, 1883. This invention relates to a means for applying power to sewing machines so that they may be set in motion from a continuously moving shafting, or stopped without interfering with the motion of said shaft; and it consists of a peculiar frictional attachment operating directly upon the needle driving shaft, and a mechanism by which it may be applied or disengaged instantly, and without the use of a treadle.

MASTS FOR ILLUMINATORS.—Piedrede Saisset, San Jose. No. 283,581. Dated Aug. 21, 1883. Considerable attention is now being directed toward the subject of lighting large areas from a single source. This can only be done by supporting the light at an elevation, and for this purpose posts and towers have been employed. The posts when constructed of a single piece are too heavy and too expensive, and if made of several sections are not strong. The tower is too costly. The object of this invention is to provide a light and cheap mast having great strength and rigidity. It consists in the novel construction of the mast, and in the application of certain illuminating devices—such as electric lamps. The mast is hollow and peculiar means are adopted for weighting the base.

STEP LADDER.—Edward A. Shumway, Walnut Creek, Contra Costa Co., Cal. No. 283,524. Dated August 21, 1883. In this step ladder the step rails and rear standards are united at or near their upper ends by means of a curved depression formed in one and a corresponding projection upon the other, formed on the arc of a circle, and united by straps or belts at their common center. Strap joints and projecting lugs limit the amount of separation of the feet.

AUTOMATIC CUT OFF FOR ENGINES.—John B. Pitchford, S. F. No. 283,656. Dated Aug. 21, 1883. This invention relates to certain improvements in steam engines, and refers more especially to the valve gear and a cut-off mechanism which is applied thereto. A detailed description would be difficult to give without the aid of engravings.

NUT LOCK.—Edwin Odell, Elko, Nev. No. 283,505. Dated August 21, 1883. This nut lock consists in a nut having a spring pawl or pin adapted to engage with a washer having depressions on one side to receive the pin, and projections on the other side, whereby it is secured to the bed plate, the head of said pin being supported by a small perforated plate.

INVALID'S SETTEE.—John Rodgers, S. F. No. 283,515. Dated August 21, 1883. This invention relates to an invalid's settee for the use of those afflicted with disorders requiring injections. It consists of a settee, or frame, having a sliding or removable top, a perforated basin, or seat rest, and a peculiar sliding box or receptacle arranged in a convenient manner.

CYLINDER FOR THRASHERS.—Andrew G. Stewart, Oakland, Alameda Co., Cal. No. 283,529. Dated August 21, 1883. This improvement in thrashing machine cylinders consists of a combination of devices and arrangement of parts. It refers more particularly to the method of securing the teeth and the tooth-holding bars.

THE NEW POSTAGE STAMP.—The new design for the two-cent stamp is the head of Washington in profile, from Houdon's bust, placed on a plain tablet. Above the oval surrounding the head are the words, "United States Postage," and underneath the tablet are the words, "Two Cents." The stamps will be printed in metallic red. The embossed stamps on the two-cent envelopes will also bear the head of Washington. A four-cent denomination of stamps and envelopes, to cover double postage under the new rate, will also be issued. The design embraces the head of Jackson, similar to that on the present two-cent stamps and envelopes. The schedule of prices of stamped envelopes has been revised. Size No. 4½ (commercial size and commonly used by business men) will cost as follows, including if desired the name (excluding business employment) and postoffice address of persons ordering, together with a request to return, printed upon them, when ordered in quantities of 500 or more: 1,000 envelopes $22.20; 500, $11.10; 250, $5.55; 100. $2.22; 50. $1.11; 25, 56 cents; 10, 23 cents; 5, 12 cents; 4, 9 cents; 3, 7 cents; 2, 5 cents; 1, 3 cents. The new two-cent stamps or stamped envelopes will not be put on sale by Postmasters before October 1st. The two and three-cent stamps now in use will continue valid, and must be accepted in payment of postage whenever offered in appropriate amounts.

AH YOUNG, the Chinese Consul at New York, has had placed in the hands of every Chinese resident, a copy of his first official proclamation. He warns his fellow-countrymen against transgressing the municipal laws, and cautions them especially against lawsuits, gambling and opium smoking.

WHY be weak? Why not be healthy, robust, and strong by using Brown's Iron Bitters?

OFFICIAL estimates of wheat and other crops in Russia show the yield to be generally satisfactory.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

GOOD TRAMS IN OAKLAND can be had at the City Hall Stables, No. 514 Fourteenth street, west of the City Hall.

The Denver Mining Exposition.

The mineral exposition at Denver does not by any means seem to have been as successful as that of last summer. Then there were plenty of exhibits and many visitors. Still there were various complaints at the time, and the whole management was not as satisfactory as it might have been. This year there is open rebellion, and commissioners of some of the Territories have endeavored to withdraw the exhibits. Arizona, Montana, and we believe New Mexico, tried to take away their minerals after placing them on exhibition, but the commissioners or managers refused to allow this, claiming that it was agreed nothing should be removed until the close of the exhibition, as is usual in such cases. In the case of the Arizona exhibit, the matter has been taken before the courts.

The complaint of poor attendance seems well founded. Montana's commissioners telegraphed to the Governor of that Territory: "The Denver exposition is henceforth an assured failure, there being no attendance." Some of the Denver papers uphold the affair; others condemn it. One paper says it is a private scheme managed by private parties, and is in no sense connected with the city of Denver. The squabble yet continues, and it is hardly probable that a similar exhibition will ever be attempted again. If it is, there will be difficulty in getting the assistance of other States and Territories, unless it is made very clear that the proper parties have the management of the affair. It is rather hard on exhibitors who take the trouble to collect and bring a fine lot of articles to be seen, to have no one come and see them.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

18th Industrial Exhibition

—AND—

Mechanics' Fair

of San Francisco, 1883,

Will Open at the NEW PAVILION on Larkin, Hayes, Polk & Grove Sts.,

—ON—

TUESDAY.....SEPTEMBER 11th

And Continue until October 13th.

This will be the most comprehensive Exposition yet held in this State of Manufactures, Art and Natural Products. A GRAND CONCERT and other extra attractions each afternoon and evening.

PREMIUMS.

A liberal list of Premiums, consisting of Gold, Silver, and Bronze Medals, Diplomas, and Cash, will be awarded to meritorious exhibits.

Members of the Mechanics' Institute, in good standing, are entitled to double and single season tickets at half rates.

Intending exhibitors should lose no time in applying for space.

Full information will be given and sent on application to the Secretary, 31 Post Street.

P. B. CORNWALL, President.

J. H. CULVER, Secretary.

DEPARTMENT NO 9—PROBATE.—IN THE Superior Court in and for the City and County of San Francisco, State of California. In the matter of the estate of ROSEMOND GREENWOOD, deceased.

Notice is hereby given, that Friday, the 28th day of September, A. D. 1883, at 10 o'clock, A. M. of said day, and the court-room of said Court, at the New City Hall, in the City and County of San Francisco, State of California, have been appointed as the time and place for proving the Will of said Rosemond Greenwood, deceased, and for hearing the application of George Spaulding and Mary Williams for the issuance to them of Letters Testamentary.

Dated, August 29th, A. D. 1883.

Is the Best Pump in the World. Another New Improvement is Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly Regular retail price $6. Weight, 4½ lbs. Length, 32 inches.

FOR SALE BY JOHN H. WHEELER, 111 Leidesdorff St., S. F.

P. S.—A sample can be seen at this office.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables, and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers, at very low rates and on easy terms. There are 12,000 acres at from $3 to $30 per acre, including pasturage, vine, fruit and grain land. Will sell a large tract at a great bargain. Send stamp for map and circular to EDWARD FRISBIE, proprietor (on the Grant), Anderson, Shasta county, Cal.

FOR SALE

By J. M. LAKENAN, of Grass Valley Foundry, Grass Valley, Cal.

One 20-inch bore engine, 24-inch stroke; one 18-inch bore engine, 40-inch stroke, Meyer's cut-off; one 14-inch bore engine, 36-inch stroke, Meyer's cut-off; two 12-inch bore engines, 30-inch stroke; two sets heavy pumping gear, with bob and connecting rod irons, etc.; 450 feet of 16-inch pump pipe of 4-inch iron, heavy flanges; besides other mining and milling machinery.

For information, address

J. M. LAKENAN,
Grass Valley, Cal.

More Legal Nonsense.

Mr. Dods, who despoiled the Oakland treasury in order that he might have material for private speculations, has taken up his residence in the State prison for five years—so the sentence says. But this righteous judgment is, it is reported, to be imperiled because Mr. Dods' lawyer has a grand theory of innocence upon which he can elevate Mr. Dods to a higher court. This lawyer appeals in this strain. Mr. Dods did not intend to steal the money; he expected to replace it; he was infatuated, and desperate in his speculation, and his intention was not to steal. Now, in the intent to commit the crime lies the essence of the guilt, and as Mr. Dods' intention was good, or at least not bad, he cannot be guilty as charged.

This is the lofty logic upon which the case is to be appealed to the Supreme Court. Of course, it is all nonsense. Probably very few of the thousands of embezzlers and defrauders who have abused public and private trusts have intended to steal, but nevertheless, the money has been converted to private uses, the trust has been outraged and the culprits are guilty, and deserve the full legal penalty for their crimes.

Intentions are well enough in their way. Even good intentions serve some purpose—they say that hell is paved with them. But good intentions are not strong enough to lift a poor, miserable thief out of the stocks because he stole to meet his pressing needs; nor should good intentions free from guilt one who fritters away the public funds in private speculations. We hope the Supreme Court will sit down quickly and very heavily upon the counsel of Mr. Dods, and that Mr. Dods himself shall remain in durance until he have time to consider how strange it is that a man with such innocent intentions could be so great a rascal.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

Don't Fail to Write.

Should this paper be received by any subscriber who *does not want it, or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Failing!

That is what a great many people are doing. They don't know just what is the matter, but they have a combination of pains and aches, and each month they grow worse.

The only sure remedy yet found is BROWN'S IRON BITTERS, and this by rapid and thorough assimilation with the blood purifies and enriches it, and rich, strong blood flowing to every part of the system repairs the wasted tissues, drives out disease and gives health and strength.

This is why BROWN IRON BITTERS will cure kidney and liver diseases, consumption, rheumatism, neuralgia, dyspepsia, malaria, intermittent fevers, &c.

Mr. Simon Blanchard, a well-known citizen of Hayesville, Meade county, Kentucky, says: "My wife had been sick for a long time, and her constitution was all broken down and she was unable to work. She was advised to use Brown's Iron Bitters, and found it to work like a charm. We would not now be without it for any consideration, as we consider it the best tonic in the world."

BROWN'S IRON BITTERS is *not* a drink and does not contain whiskey. It is the only preparation of Iron that causes no injurious effects. Get the genuine. Don't be imposed on with imitations.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DIVIDEND NOTICE.

OFFICE OF THE
Standard Consolidated Mining Company.
San Francisco, August 2, 1883.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 57, of twenty-five cents (25c.) per share, was declared, payable MONDAY, Aug. 13, 1883, at the Farmers' Loan and Trust Company, in New York, or at the office in this city.

WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 31st day of July, 1883, an assessment (No. 3) of eight cents (8c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, 528 California St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of September, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. MARTIN, Secretary.

BUILDERS OF
MINING MACHINERY.
Plants for Gold and Silver Mills, embracing the latest and most improved machinery and processes for base and free ores. Water Jacket Smelting Furnaces for silver, lead and copper ores, with new and important improvements, superior to any other make. Hoisting Works, Pumping Machinery, Chloridizing Furnaces, etc. We offer our customers the best results of thirty years' experience in this special line of work, and are prepared to furnish the most approved character of Mining and Reduction Machinery, superior in design and construction to that of any other make, at the lowest possible prices. We also contract to deliver, in complete running order, Mills, Furnaces, Hoisting Works, etc., in any of the Mining States and Territories. Estimates given on application. Send for illustrated circular.

BOUND VOLUME OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce, and valuable for future reference and library use.

COKE. PATENT. COKE.

This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co., Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.
The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.

Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

THE ROLLER ORE FEEDER.
[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.
Golden State and Miners' Iron Works,
Sole Manufacturers,
237 First Street, SAN FRANCISCO, CAL.

Patent Life-Saving Respirator.
PREVENTS LEAD POISONING AND SALIVATION.

Invaluable to those engaged in dry crushing quartz mills, quicksilver mines, white lead corroding, feeding thrashing machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and, if not satisfactory, the price will be refunded. Price, $3 each, or $30 per dozen
Address all communications and orders to

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

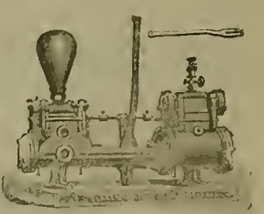
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

EXCELSIOR BLASTING POWDER,

Manufactured by the

EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

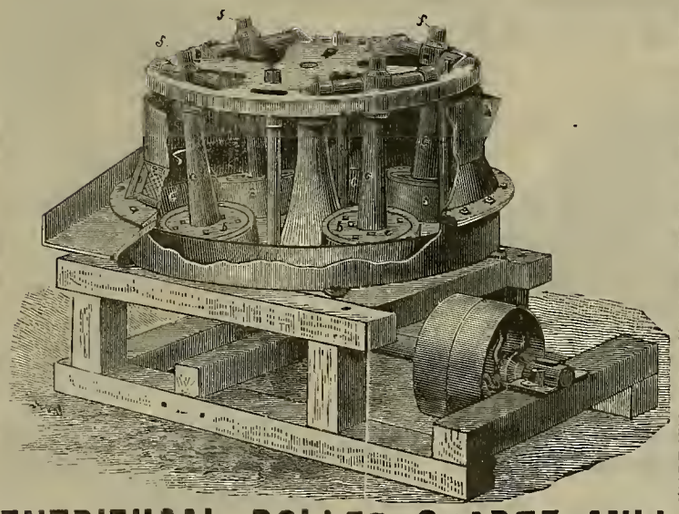
MILL & MINING MACHINERY.

F. .A HUNTINGTON,

No. 45 Fremont Street. - - San Francisco, Cal.

PATTEN'S



CONCENTRATOR

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

F. A. HUNTINGTON'S

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

CENTRIFUGAL ROLLER QUARTZ MILL!

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

F. A. HUNTINGTON, ESQ.—DEAR SIR: Your Centrifugal Roller Quartz Mill has run on the Whidden Gold Mining Company's property, at Shingle Springs, El Dorado county, Cal., about four months, and it did good and satisfactory work; a greater portion of gold remaining in the mill than in a stamp battery.

FRED. JONES, Supt.

MALTER, LIND & CO., Agents, 189 Broadway, New York.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacturs or purchass the so-called "Triumph" Concentrator, we herewith stats:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

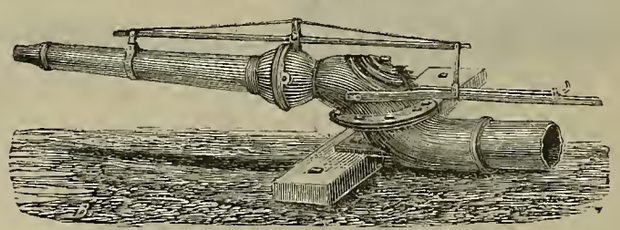
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,



Room 7, 109 California Street, - - - SAN FRANCISCO, CAL

Nov. 6, 1882.

IMPROVED FORM

—OF—

HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the-

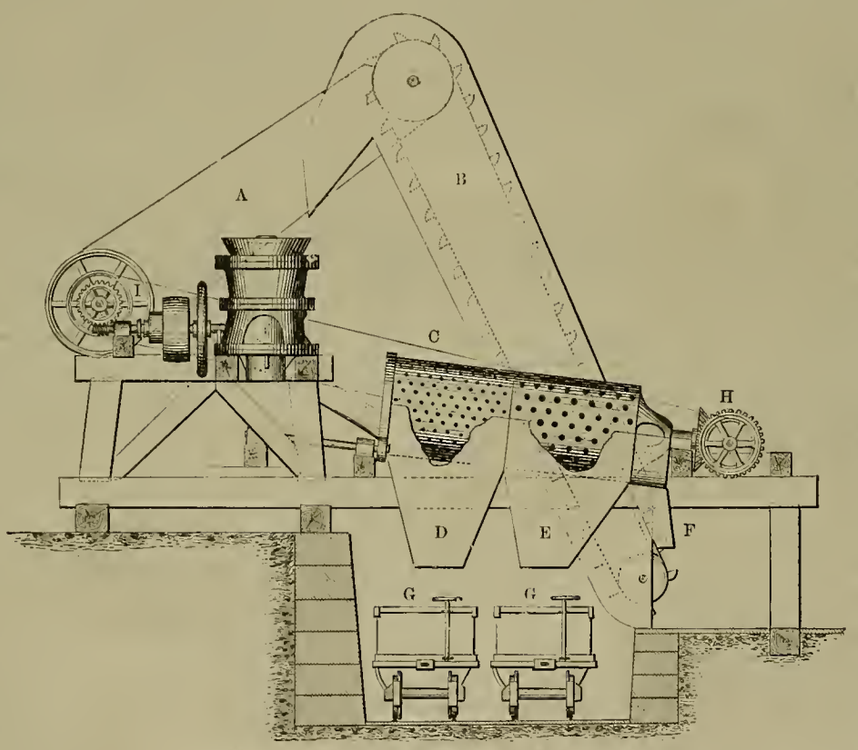
Working Silver Ores.

At the mill in Tuscarora, Nevada, where the ore from the Independence and Navajo mines is worked, some good work was done during the past year considering the class of ore. They dry, crush and roast with chloridizing furnaces, on the Nevin combination plan. The Superintendent of the Navajo in his annual report gives the following results:

The mill run covers a period of 321 days, of which the actual running time was 309½ days; showing a loss of 11½ days, including all stoppages. Milled 3,955 3 5 tons of Navajo ore, and 282½ tons of custom ore, making an average crushing of 13¾ tons of ore per diem. The average battery pulp assay of the ore from the Navajo mine was $199.40 per ton, and was worked to 92 3 5 per cent of the battery assay; custom ore averaged $332.10 per ton, and was worked to 92 per cent.

Shipped bullion on customers' account to the amount of $64,863.42. On Navajo account, to the Bank of California, from Navajo ore, $730,379.38; from custom ore, $21,549.37; from profits on custom ore, $2,206.58, making a total production in bullion of $818,898.75 (assay value) from the 21st of July, 1882, to the 7th of June, 1883; of which amount $720,874.58 was shipped during the fiscal year on company account.

The quantity of ore crushed for a battery of 10 stamps, and the per centago to which it was worked, has been unusually satisfactory. The condition of the mill for the last half of the run added materially to the cost of reduction, and the repairs required on the engine necessitated a suspension of work for a considerable length of time. The mill is now being repaired, and when completed will materially reduce the cost of milling.



The Superintendent of the Independence reports as follows:

During the past year we have extracted and milled 267 17 20 tons of ore, averaging $322.88 per ton. The Navajo Mining Co. having the mill in use, milled our ore for us at the rate of $25 per ton, net cost, and worked it to ninety-three per cent of the battery assay. Settlement was made at that percentage. We rerceeived and shipped to the Anglo Bank of California bullion to the amount of $62,910.45, and after deducting bullion discount on the balance of the bullion, and paying for the milling of the ore, we received from the Navajo company in coin $8,472.07. The ore seam averaged very small, but the grade of ore ran unusually high. The ore was extracted above the 300 foot level, and considerable work has been done in the same locality without discovering any more ore.

Heretofore nickel ore containing ten per cent of nickel has been considered rich, even when contaminated by the presence of much cobalt, which is almost universally present in nickel ores. The recently discovered ore in Churchill county, Nev., averages more than thirty per cent of pure nickel, even by the carload, and is free from deloterious impurities. The ore consists of a mixture of the arsenate and arsenide of nickel.

The Comet Crusher.

The engraving on this page represents a complete crushing plant of the Comet rock and ore crusher, for preparing railroad ballast, street macadam, etc. A is the Comet crushor set up on a good framework, from which the crushed stone falls into the revolving screen C, provided with perforated screens or wire cloth of two or more sizes, as desired. The sizes required pass by spouts D and E into railway cars, G G, below. Pieces too large pass out through the spout F into elevator B, and are returned to the crusher to be recrushed. This machine crushes without any jar or shock. The discharge is large, so there is no chance of clogging. The machines are made in five sizes, to crush from four to sixty tons per hour. The plant is one of the many which Fraser & Chalmers, of Chicago, can submit, who are prepared to make economical arrangements for all kinds of crushing.

CRUSHING PLANT WITH COMET ORE CRUSHER.

The new postal-note system of transmitting money went into operation Monday. These notes are used for sums less than $5, and are a valuable adjunct to the money-order system. There were 16 issued in San Francisco on Monday, several being procured for curiosity, the first one issued being for the amount of one cent, to be drawn on the Oakland postoffice. Most of the others were also of very small denominations.

The Union Pacific company are now making a preliminary survey for a branch narrow-gauge from Bear canyon, on the Utah Northern railway, to the western boundary of the National park. The grade will be easy, and the distance will be about seventy-five miles from Bear canyon. All surveys are to be completed this fall. The work will be finished in time to secure tourist travel next season.

The Mechanics' Fair.

The eighteenth Industrial Exhibition of the Mechanics' Institute will open at the Pavilion on Tuesday next, and continue until October 13th. The exhibition will be of the usual nature. This year premiums will be awarded. These consist of gold, silver and bronze medals and diplomas, and will be given for the following classes: Steam engines, boilers and appliances; hydraulic machinery and steam pumps; machinists' tools and metal working machinery; wood-working machinery; printing and miscellaneous machinery; mining machinery and appliances; laundry machinery; fire apparatus and appliances; marine; sewing, braiding, knitting machines and looms; agricultural machinery; iron, steel and lead manufactured products; cooking, heating and ventilating; safes and locks; cutlery and edge tools; grates and mantels; brass works and plumbers' tools; carpenters', joiners' and stair builders' work; musical instruments; vehicles, furniture and upholstery; woodenware; boots, leather and rubber goods; hemp, cordage, paper, furs and hair; woolen dress goods, cotton, etc.; furnishing goods; dresses, cloaks and millinery; tobacco; chemical and pharmaceutical products; geology, mineralogy, zoology, and botany; groceries, flour, etc.; wines and brandies; silver plated ware; scientific apparatus; surgical and dental appliances; needlework, patterns, etc.; paintings, ceramic art, sculpture, statuary and carving; engravings and drawings, photography, plants, trees, flowers, and fruit.

The progress of distinguished foreign tourists in America is watched in London with great interest, and in place of Parliamentary proceedings, the nowspapers are full of American affairs—emigration, natural resources, scenery and social conditions.

Lower California Copper.

One of the most intelligent of the ex-superintendents of the Lake Superior copper mines states that he believes that there is but one mine in that section that produces copper for 15 cents per pound. Nearly all of the copper mines in Arizona are able to turn off their product at a cost not exceeding 9 cents per pound, while one or two are able to do so for 8 cents. The copper mines in Baja, California and Mexico, it is stated, can place their copper ready for shipping at 6 cents per pound, and even for 5 cents. Labor in Arizona is from $3 to $5 per day. Coke $42 per ton. Provisions and groceries high. Freights to and from San Francisco very high. In Baja California, good Indian labor is $1.25 per day; natives $1 to $2.50, and all board themselves. Coke costs $24 per ton. Freight to and from the East, and Europe, only $12 per ton, as against much higher rates in Arizona and New Mexico. From these figures it is very evident that the development of the great copper belt on the Pacific coast of northwestern Mexico, which is over 600 miles in length, and from 30 to 50 miles wide, must bring about a great change in the price of copper, not only in the United States, but also in Europe. A company of New York capitalists are now building extensive reduction works on the coast a few miles below the Real del Castillo. They expect to put their copper on board vessels in their harbor at a good profit for 5 cents per pound. The ore from which this copper will be taken, contains about $8 in gold and $15 in silver per ton, one per cent of nickel, making the product just that much more valuable to the producers and purchasers.

It can but be a question of a little time when the price of copper must be further materially reduced, and the production of it become one of Mexico's most valuable industries. It is a question of general interest to all. This great Mexican copper belt, which is believed to contain many thousand good copper and silver mines, lies adjacent to the Pacific ocean for more than 600 miles, many of the best mines being only from 2 to 10 miles from good vessel landings.

Steel manufactured in San Francisco from the iron taken from the copper mines and iron deposits in the same mineral belt, is found in quality and temper to be superior to any ever produced in the United States. Many of the copper ores are self-fluxing, and when they are not, iron, limestone and spar are so convenient that there is no expense to flux the ores in the smelter.

A Single Locomotive is now being built in the Sacramento car shops of the Central Pacific which will be larger than any ever before built in the world. The engine will have five pair of driving wheels. The weight of the engine will be seventy-three tons; weight on drivers, sixty-four tons; weight of tender, over twenty-five tons; weight of engine and tender when fully equipped for the road, 105 tons. The length of engine and tender will be sixty-five feet and five inches.

CORRESPONDENCE.

Notes from New Mexico.

[From our Traveling Correspondent.]

New Mexico is just beginning to find out that she too has a birthday to celebrate. She now begins to know that she has arrived well into her teens, and can now enter society, and her grave seniors, after due deliberation, concluded to call a council and determine what that celebration should be and what it should be named, and announced to the world. The records of all the five Yankee celebrations, "Bunker Hill," "Boston Tea Party" and "Plymouth Rock," were received with a lively interest, especially to the Yankee descendants now living here, but did not seem so important to the Spanish and Indian portion of the great council. There seemed to be a lack of enthusiasm, and a lack of the proper alloy to cause these three races to fuse properly together and form one common interest, which alone could insure success. The Pueblo or village Indian is industrious, and yet quite willing to join in a general meeting and celebrate his first acquaintance with the Spanish visitors.

The Spanish were reminded that this was an occasion to see themselves placed on the car of progress, leading off with St. Augustine of Florida, the old Virginia Colony and Plymouth Rockers long years behind them. "Besides," rejoined one, as if just awakened from sleep, "it is highly fitting that New Mexico should now be heard from as the grand central point of the nation, as well as the point where we can date the first white settlement back to 1550, 333 years ago!" After a few rousing suggestions, it was unanimously resolved to celebrate in a manner becoming and appropriate to their size or area, age, wealth and position, and so as to fully do honor to their three distinct civilizations, who now reside harmoniously in this great Territory.

The various committees and officials being carefully elected and appointed, the work was entered into in earnest, and resulted in announcing

"The Santa Fe Tertio-Millennial Anniversary,

Character Celebration and Industrial Exhibition opens July 2d and closes Aug. 3d, on 33d day of 333d year." The undertaking was gigantic, as any one can judge who has any knowledge of these dissimilar elements. The descendants of the old Aztecs, the Pueblo Indians, the various grades of Spanish-speaking settlers, now slightly in the majority, many of them very poor and a few quite wealthy; and all to be blended and sandwiched with a Jonathan Yankee minority to superintend the whole affair and make it really all distinctively an American show. Yes, American—in the sense of progresion, as contrasted with "*Esta Buena*," in the sense of don't trouble to better it—*satisfied*.

I dare not go on to expand this idea of the meaning of American in its good sense; but when an aged white frontier teacher and preacher had made a short discourse both in American and Spanish in the great audience-room of the exhibition, to the effect that, besides the teaching of science, there was need of a teaching of the heart, or conscience, that would govern men where they would not fear being reached by the arm of the civil law; this discourse was plain and convincing as the only line of progressive civilization. He was followed by an

Aged Chief of the Utes,

Who spoke earnestly and eloquently, and indorsed that which he had heard in the Spanish version of the former speech, and desired that his children should be taught both in our business and our religious education.

Turning to his little son nine years old, he brought him forward on the stage and said, "My boy now attends your school, and is already able to read and write quite well." The chief expressed much satisfaction in seeing his boy clothed and treated as an American lad.

When the interpreter had finished the interpretation of the chief's speech, he was urged to say a word or two himself, and he gave a very affecting narration of how this chief and his warriors there present had exchanged bullets with our soldiers under this interpreter, and left their marks on each other twenty years ago; and how this same chief, and these warriors had since bravely saved whites from being killed by hostile Indian foes. The narration was simple and touching, and interested all, and left the impression very strong that peace, prosperity, and progression are radical ideas in our true Americanism.

Santa Fe

(Holy Faith) town was considered the proper town for such a celebration; the capital of of the Territory, and amply supplied with public grounds and buildings for the exhibit, and also ample city room for many thousands of visitors—Santa Fe, a name so familiar to every one from Maine to San Francisco, as a prominent old trading post and landmark familiar to many brave frontier traders long before the days of '49. The romantic, and hilly environment of the old city, that enjoys the healthy elevation of 7,000 feet, with all the marks, signs, and collections of past ages added to the modern improvements that have been recently added, made it emphatically the place for this immense undertaking of a grand historical spectacular show which could not have been made a success in any other place. The programme was laid out for each day, and printed on a large pocket folder, similar to those used for railroad maps and time tables. It was printed on tri-colored and illuminated embellishments. The programme for the first day opened with an artillery salute, grand military and civic parade; opening ceremonies and address by Gov. L. A. Sheldon; also an historical oration and other addresses by distinguished public speakers, music, etc. Afternoon, Indian races, dances and games in the arena.

Each day had a prescribed and varied programme, historical processions in characters, speeches in American, Spanish and Indian, poems, music, races, fireworks, competitive drills in military tactics, military balls and banquets, Spanish balls and fandangos, native Mexican dancing and juggling, aztec dances of different forms, in which both Indians and Mexicans joined; all kinds of comic races and amusing customs were brought into the programme to insure a lively interest in all the various classes in attendance.

But one great feature of the exposition was the great collection of all the

Relics of the Past Ages

To contrast with their substitutes of to-day in every department, tools, machinery and implements. There were the Navajoes spinning and weaving their heavy blankets on a loom very rude, which had been in use 200 years.

Near by was an Italian woman making by hand beautiful figured lace trimmings.

The Spanish jeweler was showing his great skill in making fine filigree silver work, while in the adjoining shed the Indians would be busying themselves in making buckskin leggings, fringing and decking them off with some crude ornaments, and others working head and neck ornaments. But the great point and object of the exhibit was to let the mineral wealth of New Mexico be made apparent to the world, and also its easy accessibility by railroads now completed, and others chartered and surveyed. One remarked, "This whole show is only an advertisement." Granting the correctness of his statement, it was a noble and praiseworthy exhibit of the great resources of a large Territory containing 121,201 square miles, an area almost equal to three times that of New York State, and greater than New York added to all the New England States. This great central Territory is now divided into 12 counties with an average area of over 10,000 square miles each. The climate is temperate, and being elevated from 5,000 to 7,000 feet, has a very pure and healthful atmosphere.

On entering the great hall where the minerals were displayed (a structure very long and wide), the first on the right is the attractive sign of

Socorro County.

This county occupies a central position in the Territory, on the Rio Grande river. It is a pleasant and healthy county, producing fruits—pear, apple, apricot and peaches—with small attention. Also, the Mission grape is a success, as are the principal garden vegetables, and corn, wheat and oats. It now enjoys the advantages of the Atchison, Topeka and Santa Fe railroad running through it, and joining the S. P. R. R. at Deming, giving it a new life and impulse as a county, and evidence of this great impulse was to be seen in ample exhibits of its products. Some sheaves of oats, wheat and barley were there to speak loud for the staff of life. Previous to the advent of the railroad to the county they used to export grain and flour to western Louisiana, Arizona and Mexico. Now they have local purchasers, and more home consumption than they can supply. The Socorro exhibit was a mineral exhibit of great merit.

As the Commissioner, Prof. Chas. Lougemare, remarked, "these samples represent 382 mines from 47 mining districts," and they were not thrown carelessly up, but neatly arranged and labeled; and some of the mines had carefully drawn diagrams showing all their underground working; list of working assays of ores; the district, officers, etc., of that mine; sometimes adding how many tons of ore on the dump, or as the Cabinet mine put it, "Seventy-five thousand tons of ore in sight. Owned by Rio Grande Mining Association of Minnesota."

These various samples were a larger portion of them smelting ores, containing gold and silver, or silver alone. One sample of magnetic iron ore carrying tin, lead, silver and copper; its magnetic iron was shown by its holding a large number of nails attached to it and to each other. Fine samples of fire clay, for brick and furnace linings; coal of fine quality for coke and railroad use.

"Salt 22,000 acres in a body, 85 miles southwest of Socorro," favorably represented by fine specimens of mottled marble from 3 miles east of Socorro City.

There were specimens of ores from Black range, west of Socorro City, worth $15,000 to the ton.

One little sample from Kelley mine weighing 975 pounds, carb lead ore carrying 9 ounces of silver to the ton—large vein. From what was here exhibited by a very able representative of New Mexico, but especially commissioned to exhibit this county, it is evident that this one county has plenty of resources for wealth, and if half developed, ample for one whole State. Socorro county can furnish some mining

Claims of Sensational Richness,

But their greater merit seems to be in the fact that they have abundance of large true fissure veins, and evenly diffused pay, and lack none of the requisites in fluxing materials for their proper workings.

The Great Republic in Black range claims a vein of 12 feet, carrying 200 ounces of silver with one to three ounces of gold per ton. A neighbor to this mine is the Ivanhoe, a 7-foot ledge of great reputed richness, more noted from the fact that Col. R. G. Ingersoll was reported to have lost $50,000 in this stock, while it is said that it would take more than double that amount to buy that same stock.

Some distant speculator might lose his money on the best mine ever opened and the mine not be in any way responsible for his reputed or real loss. Passing to the opposite side,

Santa Fe County

Claims a recognition by a huge pyramid of anthracite coal with a grand arch built of coal and coke. Her display, consisted of gold, silver, copper, lead and iron ores, petrified tree sections, together with piles of metals and lead bars from Los Cerrillos works. The fire clays and coal exhibits were from the same location. This exhibit, like many others, was trusted mainly to speak for itself, and seemed to say, "Visitor, as you see me, so judge me," and pass on to see

Taos County,

That also gives a creditable showing of varied minerals. And right beside them stand about a dozen sacks filled with miners' beans, flour, wheat, oats, etc., to show that Taos can feed its miners from its own agricultural resources.

Lincoln County,

The largest and newest county, located in southeast corner of the Territory, and yet remote from railroad, is said to be one of the best watered and best grazing tracts in the Territory. There is much flowing water, and plenty of places where wells from four to forty feet in depth give abundance of good water. Through this county from north to south runs a wide mineral belt, carrying every variety of precious metals. Beginning on the north, we find copper and galena ores with gold and silver; further to the south, in the Hickorea range, are rich placer diggings, but little developed for lack of water.

About the center is the camp of the White Oaks, where are free gold ores. The ore is a peculiar kind, a dark, porphyry granite. In the same region are some thousands of acres of gold fields, the principal claimants for which are Gould & Huntington, who have somewhat proved the value of same by development. Twelve miles further south in the same belt begins the Nogal and White mountain ranges, also very rich in silver ores, and in the same range there is one lead of free gold ore very rich, on which there are now five different claims located.

The valleys in these ranges of mountains are all being located as ranches for raising vegetables, vineyards and orchards. Onions yield as high as 3,500 pounds to the acre, single ones weighing four pounds. The Pecos river, running southerly along the eastern portion of the county, is furnishing much good ranch land with water. The valley is fast being taken up by farmers and cattle ranchers. The larger portion of it is surveyed. Homestead and preemption claims are being made. The great wonder and astonishing feature of Lincoln county is that it has no land grants and no railroad sections to molest or make the settler afraid.

There is an Indian reservation for the home of a small remnant of Mescalero Apaches, with San Juan their chief and about 400 followers, all friendly. The population is about equally divided in Spanish and American speaking people. The county is divided also about equally in valley and mountain and hill lands. The county seat is Lincoln, in Sierra Capitan district. White Oak is the principal town in the district of the same name, 100 miles from railroad station of San Antonio, on the A. T. & S. F. railroad.

This county sent an able, pleasant and efficient commissioner with good showing for an infant county. His name has escaped me at this moment. I next step over to the booth of Grant county, away down on the border of old Mexico, and forms the southwest corner of New Mexico and neighbor to Arizona. The beautiful sign of the booth says

"Kingston,

"Grant county, N. M.," from which we infer that Kingston, the town of the famous Percha district, is a representative live mining center, and all doubt of this is dispelled when a careful inspection is made of her exhibits of fine ore specimens; her native copper; sheets of red oxide twenty-two inches long by twelve inches wide, and one-eighth of an inch thick. There were fine bars of copper from the Hanover and San Jose smelters. In these show cases were their hoss rich ores not safely trusted outside. We all wanted to feel of those samples. One fine one, labeled "Carbonate lead ore, value forty ounces of silver per ton, sixty-four per cent lead," is very good smelting ore.

As this hasty glance of only one district of a great mining county is entirely too brief to notice anything of its geological characteristics or any of its individual claims or developing enterprises, I can say to any interested that the Kingston (New Mexico) *Tribune* has issued a neat 50-page pamphlet descriptive of the mines of that district, which they offer to whoever sends them an address with a three-cent stamp to cover postage.

Donna Anna County,

Lying to the east of Grant county, and also joining Mexico on the south, gave some good exhibits of copper ores. The Bobtail mine, Hillshoro and others piled up gold, silver and copper ores of high assay value.

Sloan & Reed, brokers of Santa Fe, exhibited good specimens of mines of different localities. They are regarded as reliable business men and handle good properties,

The Atlantic and Pacific railroad, which runs from Albuquerque, N. M., through a portion of New Mexico and entirely across Arizona Territory on the 35° of latitude, gave a rare collection of fine specimens of rich Arizona ores in a heavy rustic trimmed show case. In this collection Mojave county made a bright showing of gold and silver, wire and silver moss specimens.

Outside the case they exhibited other minerals and coal from their own coal mines at Gallup. Also, petrifactions from the forest of petrified trees in Arizona, near the line of A. & P. railroad, and samples of corn and grain and other

Soil Products,

Making a very creditable display of the resources of the country passed over by their 565 miles of steel railway, which is now spiked across the Colorado river and opens direct route with S. P. R. R. to San Francisco through the noted Calico mining district. This by no means exhausts the mineral exhibit nor does even a fraction of justice to those noticed. Arizona was represented also in some rich specimens from Prescott in charge of F. M. Murphy, able Commissioner for Yavapai county to the Denver, Colorado, mining exposition. His collection was hard to equal, especially the varied types of rich copper ores.

Eastern visitors to the Santa Fe Exposition were much pleased to be able to see so

Many Tribes of Indians

There represented, exhibiting many of their games, ceremonies and customs, ancient and modern. The town of Santa Fe itself is an old curiosity shop in its ancient buildings and in its relics and historical landmarks. The new and modern town is growing right up in the midst of the old, and the contrast is very marked. The University of New Mexico is a modern brick structure, three stories high, nearly completed. The Catholics have large institutions here, as they also have in the other large towns of New Mexico. This reminds me of one exhibit I think worthy of mention, and that is the drawings by lead pencil from the

Indian School

At Albuquerque, under the superintendence of R. W. D. Bryan, aided by a very efficient force of teachers.

Each picture was signed by the name of the pupil who drew it, and how long time they had been in school. They were very creditable to both scholar and school. I visited the school, found about ninety scholars well cared for and seemingly happy, and learning very fast. The lady teachers are very skillful in teaching them to speak, spell, read and write a new language. They instruct in much besides the book studies; household duties, sewing and fancy work. The boys are training for farmers. The exposition could not show the rapid growth of mining and railroad towns, nor can I here but allude to it. There was a marked absence of mining machinery at the exposition, yet there was one hand power windlass for a mining shaft that for efficiency, cheapness and safety, is perhaps the boss of all the hand-power windlasses. It was invented by C. W. Baldwin, of Denver, Col.

A machine panner, or fine gold-saving machine, very ingeniously constructed and light for transportation, was exhibited by the inventor. Santa Fe made a great effort to interest and accommodate many visitors, and succeeded.

B. W. CROWELL.

Denver, Colorado, Aug. 15, 1883.

THE GREAT TACOMA GLACIER.—Senator Edmunds in speaking of his visit to the Great Tacoma Glacier, in Washington Territory, says: "I absolutely never believed there was anything in America comparable in grandeur to the scenery I have seen on my necessarily brief visit to Mount Tacoma. The access, thanks to the well-cut trails made by the engineer of the Northern Pacific railroad, is easy, and as I learned from Mr. Oakes, will be made as easy as a carriage road, or nearly, within a month from now. To express half of my admiration for the transcendent grandeur of every part of the scenery, and especially of the glacier, would be impossible. A more perfect glacier, in all the features found in such a phenomena, it would be impossible to find. Certainly, no Alpine glacier excels it in perfection, and yet as I was given to understand, it is the least, in point of size, of all that have been discovered on this mountain. I cannot help saying that I am thoroughly convinced that no resort in the United States will be so much sought after as this, when once people come to know that what men cross the Atlantic to see, can be seen in equal splendor, if not surpassed, at home.

TO QUOTE a phrase current among miners and prospectors, "When the Lord made the Upper Wood River country he had a superabundance of land, and to make room for it all he was obliged to set it up on edge." This leaves the trail from Sawtooth to Atlanta very steep over a mountain 8,900 feet above sea level, on the top of which blooms a well-watered garden of flowers of every color and perfume. The enchanting view, the wildness of the rough mountain below, the fallen trees laid away to their everlasting rest in beds of ferns and mosses, and the grand mountain peaks in the distance, give a beauty and strangeness to the spot such as can never be rivaled by the hand of man.

MECHANICAL PROGRESS.

The Rolling of Molten Metal.

We made a brief reference in these columns a few weeks since to a suggestion which had been made to roll molten metal. The *Iron Age* of a later date refers to the matter as follows:

One of the mechanical papers of this city, evidently more at home in matters pertaining to the lathe, planer and other appliances of the machine shop than in the department of metallurgy, remarks: "*Iron* notes a proposed rolling mill for rolling iron and steel, to be delivered to the rolls in a molten state, by which it is claimed it will be freed from gases. The rools are to be hollow, and a current of water passed through them to chill the surface of the metal. We should like to be told how molten iron can be rolled. —*Iron Age*.

Judging from this, and from the fact that the item which provoked our mechanical contemporary's criticism was extensively reproduced in different papers and considered as something entirely new, it would seem to have been lost sight of that a similar attempt was made some time ago by Sir Henry Bessemer. In the arrangement as brought out at that time, sheet metal was to be made directly from the converter by pouring the molten metal between two revolving rolls. So long as the supply of steel was properly maintained and the rolls worked freely without meeting any obstruction, a continuous sheet of metal of good quality was obtained, and the product, when worked up, was said to give very satisfactory results. However, it is by no means difficult to point out elements of weakness in the method, and to these it is probably due that the rolling of liquid metal never seemed to meet with much favor. Prominent among them is the item of a continuous supply, as it is clearly apparent that anything producing a check in the flow of metal would lead to a more or less complete dismantling of the whole train. The destructive action of the highly-heated metal upon the rolls, tending to produce rough surfaces, is another point of considerable importance, especially in turning out sheet metal, where irregularities, however slight, are necessarily fatal to good results. Another disadvantage is found in the difficulty of keeping the liquid metal free from such impurities as slag, etc., from the ladle, which, when worked into the sheet, would necessitate the cutting away of large portions, thus entailing considerable waste. Even in view of all these difficulties, however, the operation of rolling molten iron or steel is not impossible of execution, and it is to be hoped that our contemporary's remarks, which, we think, can scarcely be misinterpreted, will not be too firmly impressed upon its readers.

Ashes in Mortar.

Mr. J. A. Shinn has obtained a patent for the use of ashes in making mortar. It has been found that the fine portion of domestic ashes is capable of being converted, with a small proportion of lime, into a mortar having, when a month old, a tensile strength of from four to five times that of common sand and lime mortar, or about eighty pounds per square inch. Sand mortar a month old has a tensile strength of twenty pounds. Ashes and lime mixed as beton, gives a tensile strength of 140 pounds, and a crushing strength of over 1,100 pounds per square inch. It will thus be seen that, by utilizing the ashes for mortar, a large part of the expense of removal could be saved, together with the whole cost of procuring sand for that purpose, and at the same time a very superior article of mortar be produced. In consequence of the small quantity of lime required (ten per cent), it would be necessary to mix the mortar by machinery at a mill and deliver it ready for use. This practice prevails to a great extent in European cities on account of the superiority of milled over hand-made mortar.

Ash mortar has the additional advantages of resisting the action of water as soon as it has set (in from two to three days), and also the combined action of fire and water, the quantity of lime being so small and the chemical union with the ash so complete that the application of heat does not produce free oxide of lime, as in the case of sand mortar, and consequently does not swell when the water is applied to the heated mortar.

The weight of ash mortar is about one-half that of sand mortar when both are dry, and it works soft and smooth. Ash mortar forms, when set, a silicate of lime and alumina, and hardens uniformly throughout, like cement; while sand mortar, when set, is but an imperfect carbonate of lime, the sand furnishing the nucleus around which the carbonate forms. Ashes made under steam boilers, or in other fires where a high degree of heat is maintained, are not suitable for mortar, owing to the chemical change which takes place in the fire, the finest part of such ash, that found behind the bridge-wall of the boiler, being found to be of the same nature as the coarse clinker, having no special affinity for lime, and being only fit for combination with cement or plaster.

American Furniture Abroad.

American furniture, owing to the superior modern design and artistic finish is fast obtaining a foothold in foreign countries, and American woods which have very little recognition at home, are coming into prominence in Europe as very desirable, both for the manufacture of furniture as well as for interior house finishing. One of the most flourishing, profitable and important branches of American industry, is the manufacture of furniture. Not only do our factories supply the needs of 53,000,000 of people, but scarcely a ship sails from our ports without carrying among her cargo specimens of this class of manufactures. The American made furniture is preferred in several foreign countries for many reasons. The taste of the American artisan is refined and elegant, and the work he turns out is light and symmetrical as well as strong and durable. While the English, French and German manufacturers still cling to their antiquated fashions and old methods, the Americans are constantly inventing new styles or improving on the old, and are thus in this branch of industry, as well as in many others, also far ahead of their transatlantic rivals.—*Wood Worker*.

LONG runs of machinery, whether steam engines or other motors, are highly desirable when they can be accomplished with the usual appliances. The necessities of modern manufacturing are urging engine builders in the direction of machines of all kinds that can continue their work without interruption from year's end to year's end. Experience, good workmanship, careful designing and attention to the minutest details make such runs as that just mentioned possible, and that, too, in a commercially practicable way. The needs of electric lighting have been very exacting in respect to regularity of speed and long-continued runs, and these have greatly stimulated engineers in their efforts to make engines capable of producing large power in small space, and keeping up their work for long periods without interruption.—*Iron Age*.

STEEL nails seem to be working their way into popular favor. At first the extra cost of steel nails was one and a half cents per pound, or $1.50 per keg, but it has now been reduced to $1. The great advantage of the steel nails is that they can be driven into hard wood as easily as an iron nail will go into a pine board. Steel nails have been driven into a white oak knot without bending. Nothing else is now used in laying hard wood floors, as they require no boring, but are driven readily. For all kinds of finish they are especially adapted, and as so much hard finish is now employed their use must be on the increase. They are also used largely by builders, and box makers are increasing their demand for them. Box makers have been using the better grades of iron nails, as they desire those that can be drawn and redriven.

A GOOD boiler, properly proportioned, and not driven beyond its normal rating, and with good feed water, when there is no provision made for superheating, should give practically dry steam, that is, not containing above three per cent of moisture. If there is a superheating surface attached to the boiler, the steam may not only be perfectly dry, but heated to a temperature considerably above the temperature due to its pressure, while with a boiler having insufficient steam space, certain kinds of bad feed water, or which is driven too hard, the amount of water carried over with the steam may be ten or fifteen per cent.

BAND SAW FOR IRON AND STEEL.—The hand saw seems to be constantly enlarging its field of usefulness. The latest advance in this direction consisted in an interesting application of this device, as shown at the late Engineering and Metal Exhibition in England, for cutting cold iron and steel. The appliance, which was of English manufacture, is said to have met with gratifying success, and is now extensively employed in arsenals, gun factories, locomotive shops and the like, for cutting out gun carriages, tender and wagon framings, ship plates, etc.

ANCIENT CIRCULAR SAWS.—That the hard basalt and granite used in Egyptian buildings of some 4,000 years ago, were cut by circular saws of some sort, is proved by recently examined specimens with the tool marks fresh upon them. The circular marks are as distinct on these imperishable stones as on a fresh pine plank. This proof of the existence of ancient circulars is curious, for that form of saw has been believed to be of modern invention.

THE KEELEY MOTOR.—Dispatches from New York of the 29th inst., say the famous Keeley motor is at last completed; that the final inspection of the machinery has been held, and that it will soon make a trial trip to New York. Treasurer Green, of the Trustees, expresses himself as exceedingly hopeful, and declares that the day of Keeley's vindication is very close at hand.

A MACHINE for compressing sawdust and shavings into small cakes or bales to be used for fuel is attracting considerable attention. The fuel thus made has an ascertained value of $3.25 per ton, and is manufactured at a total expense of 70 cents per ton on board vessel or cars at place of manufacture.

AS THE strength of a chain is equal to that of its weakest link, and the carrying capacity of a water pipe equal to that of its smallest part, so the conductivity of an electric circuit is only equal to that of the part which offers the most resistance.

SCIENTIFIC PROGRESS.

Scientific Inquiry.

The Victoria Philosophical Institute is an association in England which now numbers 1,020 members, of whom about one-third are foreign born—mostly Colonial and American. This association was founded to investigate all questions of philosophy and science, but more especially any which may be alleged to militate against the truth of revelation.

At a recent session of this society in London, a carefully prepared report was read on the various theories of evolution, in which it was attested that, as yet, no scientific evidence had been met with giving countenance to the theory that man had been evolved from a lower order of animals; and that there was a complete absence of any fossil type of a lower stage in the development of man; and that any positive advance in the province of prehistoric anthropology has actually removed us further from proofs of such connection—namely, with the rest of the animal kingdom. In this Prof. Barrande, the great palæontologist, had concurred, declaring that in none of his investigations had he found any one fossil species develop into another. In fact, it would seem that no scientific man had yet discovered a link between man and the ape, between fish and frog, or between the vertebrate and the invertebrate animals; further, there was no evidence of any one species, fossil or other, losing its peculiar characteristics to acquire new ones belonging to other species; for instance, however similar the dog to the wolf, there was no connecting link, and among extinct species the same was the case; there was no gradual passage from one to another. Moreover, the first animals that existed on the earth were by no means to be considered as inferior or degraded. Among other investigations, one into the truth of the argument from design of nature had been carried on, and had hitherto tended to fully confirm that doctrine.

Two sessions were devoted to a consideration of the questions raised in Mr. Herbert Spencer's philosophy. It was stated that Lord O'Neill and others had shown, by a careful analysis of his arguments, that a greater attention to accuracy in statement would have kept Mr. Spencer from arriving at those hasty conclusions which had made his philosophy remarkable.

It may be questioned whether scientists who are fully committed to any particular theory are the safest men to most carefully search for facts and reasons which may militate against their favorite theories.

Autographic Reproductions of Fossils.

Mr. Fayol recently exhibited at the reunion of engineers of Saint Etienne, a number of autographic reproductions of fossils, and explained the process of obtaining them:

(1) By means of an inking roller, printing ink is spread over the object to be copied. (2) Upon the inked object there is laid a sheet of ordinary white paper slightly moistened, and this is then pressed down with the hand or with a small pad. Such is the simple and expeditious process by which were obtained the autographic reproductions of leaves, insects, medals, lace, and fossils represented in the plates shown at the reunion.

These plates were lithographs that had been made in the following way: For the ordinary white paper that is used when merely an impression is desired, there was substituted what is called autographic paper. This latter permits the impression to be transferred to stone by a process opposite that which served to take an impression of the fossil. On sending to the printer the impression on autographic paper, which any one can take, the printing costs ten francs per one hundred double plates, or five centimes per single one. As for equipment, all that is necessary is an inking roller, printing ink, and autographic paper, all of which may be procured of the printer. The total expense cannot exceed six francs. Most of the coal fossils could not be inked directly without injuring them, and to preserve them they are previously covered with a layer of silicate of potassa. The sirupy silicate of potassa (water glass) found at drug stores is diluted with water, and the fossil is then soaked in it. The imperceptible layer of silicate preserves and even brings out with greater sharpness the slightest shades and the most delicate lines. After drying, the inking may be done without trouble; and, after the impression has been taken, all traces of the ink may be removed with spirits of turpentine.

FORMATION OF COMETS' TAILS.—In a recent paper, Mr. Ranyard gives some further details with regard to his theory as to the formation of comets' tails. He points out that the experiments of Prof. Graham and the more recent investigations of Prof. Wright show that all classes of meteoric bodies hold gas as a sponge holds water. When the meteorites are heated in the laboratory the occluded gas escapes, and as a swarm of meteoric stones in space comes up to perihelion and is heated by the sun, the occluded gases must be driven off. At a distance from the heated nucleus, where radiation into space can take place freely in all directions, Mr. Ranyard conceives that a mist is formed by the condensation of the less volatile gases. The particles of mist will be bombarded on the side towards the nucleus by the swiftly moving molecules of the more volatile gases escaping from the heated meteors. Condensation on the surface of the mist particles and evaporation from their sunward sides will be set up, and repulsion of the mist from both the sun and nucleus will follow. According to Schiaparelli's theory a comets' nucleus consists of a swarm of meteoric stones; according to Mr. Ranyard's development of this theory the tail is due to a very thin mist formed from the condensation of occluded gases, the particles of which are driven backwards by the recoil due to evaporation towards the sun.

FERMENTATION OF BAKER'S DOUGH.—It has hitherto been supposed that the fermentation of bread dough set up by sour leaven, or beer yeast, was a real alcoholic fermentation. We learn from a paper in *Comptes Rendus*, that C. Chicandard has investigated the subject microscopically. He found that the *Saccharomyces cerevisiæ* put into the dough very soon disappeared and numerous microbes, which he took for bacteria, made their appearance. These bacteria multiplied with great rapidity on the yeast in dough, and they can be cultivated in water containing yeast. Hence he concludes that the beer yeast favored the growth of these microbes. An analysis of the gases evolved during fermentation proved the presence of 70 per cent of carbonic acid, while the rest consisted of hydrogen and nitrogen. The composition of these gases is similar to those formed by the putrefaction of albumen. From this it would appear that the fermentation of bread does not consist in liquefying the starch by alcoholic fermentation, but in the conversion of one portion of the insoluble albumen of the gluten first into soluble albumen and then into peptone. Starch is first decomposed by heat in the process of baking, forming soluble starch and some dextrine. The cause of the fermentation is, however, a bacterium.

PRODUCTS OF THE SLOW COMBUSTION OF ETHER.—When the vapors of ether mixed with air pass over a strip of glowing platinum, it continues to glow and the slow oxidation produces a mixture of formic and acetic acids with aldehyde, acetal, and methyl aldehyde. Legler has investigated this product (*Ann. Chem.*), and succeeded in isolating another new substance. From the slow oxidation of 150 or of 200 c. c. ether he obtained 25 or 30 c. c. (1 ounce) of a clear liquid with a sour smell resembling aldehyde. Upon cooling this in a desiccator the new substance crystallized out rhombic prisms. It contains 26.44 per cent of carbon to 6.42 of hydrogen which points to the empiral formula $C_{11}H_{33}O_{21}$. It is a peculiar fact worthy of note, that when treated with ammonia and then acidified it exhibits the same reaction exactly as peroxide of hydrogen. Legler is engaged in investigating the constitution of this new substance.

THE PLANET MARS.—Prof. Lockyer is of the opinion that human life on the Planet Mars may be very much like human life on the earth; the light cannot be so bright, but the organs of sight may be so much more susceptible as to make the vision quite as good. The heat is probably less, as the polar snows certainly extend further, but by no means less in proportion to the lessened power of the solar rays. The professor agrees with others, that several remarkable seas—including inland seas, some of them connected and some not connected by straits with still larger seas—are now definable in the southern hemisphere, in which, as is the case also with the earth, water seems to be much more widely spread than in the northern hemisphere.

THOROUGH prevention of the moldy smell of stored corn or other cereals depends almost absolutely upon thorough ventilation. And, by the way, a bad odor anywhere in homes, offices, stores, is a hint from nature that something is wrong which requires prompt and thorough attention. All this business of applying disinfectants and so-called antiseptics do more harm than good for the most part. They simply mask poisons, to put the matter strongly, leaving the prime cause as fertile of disease-producing germs as before.

AN Austrian has invented a process for placing on copper or other metal rolls designs to be printed on any kind of woven fabric, such as cotton, woolen, silk and felt goods. By this process the most delicate tracery of lace work may be produced on furniture coverings and window hangings. Photographs, engravings and other pictures may be exactly reproduced and duplicated to an unlimited extent on copper, steel and other metals rapidly and cheaply.

ANTIQUITY OF MAGNIFYING GLASSES.—In the writings of Confucius, the great Chinese philosopher, occurs the following passage: "As we use a glass to examine the forms of things, so must we study antiquity to understand the present." This sentence points most unmistakably to the use of magnifying glasses long before the time of the writer, who died 478 years B. C.

ADAMASCORITE.—Adamascobite is the local name of a mineral which is said to be found in only one place in the world, and that is the State of Missouri. The stone is very peculiar in its structure and properties. Its cutting power is diamond like, cutting away steel very rapidly, and still retaining an exceedingly fine edge.

AN English newspaper reminds us that United States treasury bonds to the amount o £24,000,000 are held by three persons—the Duke of Southerland, Sir Thomas Brassey, and the Baroness Burdett-Coutts.

Mining Share Market.

The market this week has been comparatively strong, as our stock tables show. Yet there have been no special developments to record. On the Comstock everything is moving on about as usual. At Gold Hill the work at the several leading mines is now principally introductory to active operations when the mills on the Carson river can again run to their full capacity.

The bailing tanks are running at the Alta and are lowering the water at the rate of 25 ft. per day. When the tanks were put on the water was up to the 1100 station, but it has been lowered to within a few feet of the 1200 level. The pumps above the Sutro tunnel level have been removed.

The following mines report cash on hand on September 1st: Alta, $32,785; Argenta, $866: Andes, $9,507; Albion, $364; Benton Con., $8,476; Best & Belcher, [$362; Bulwer, $914; Bodie Con., $13,287; Belcher, $24,786; Crown Point, $23,591; Con. Virginia, $87,161; California, $1,803; Con. Imperial, $4,478; Chollar, $8,756; Challenge Con., $5,365; Gould & Curry, $30,841; Hale & Norcross, $4,986; Jackson, $3,850; Mexican, $5,003; Northern Belle, $13,290; Ophir, $76,073; Occidental, $5,860; Potosi, $8,158; Scorpion, $160; Standard, $132,707; Sierra Nevada, $15,608, Savage, $22,510; Utah, $9,456.

Bullion Shipments.

Contention Con., Sept. 1st, $12,730; Hanauer, 1st, $5,100; Ontario, 2nd, $17,425; Horn Silver, 2d, $42,000; Alice, 2d, $11,375; for August, $119,109. Silver Reef mines, for August, $42,077. There were shipped from Salt Lake during the week ending Saturday, September 1, 47 cars of bullion, 1,171,024 pounds, sent East; 40 cars ore, 780,000 pounds, sent to Colorado, and 97,130 pounds sent West; one car white lead, 22,500 pounds, sent West, and 3,000 pounds granulated lead sent to Denver, making a grand total of 88 cars, aggregating 2,073,654 pounds.

LOW GRADE GOLD ORE.—In the Mint Director's report of this year is the following suggestive paragraph referring to the Zeile mine: The rock is low grade and assorted in the mine; the best is sent to the mill, the balance thrown aside in the drifts. It is by a careful system of working that the mine is made to pay. The rock only pays $2 per ton in free gold and from $5 to $6 per ton in sulphurets, which brings the yield up to a fair average. This proves that with good management and strict economy, together with good facilities for mining and working the ore, it can be made to pay when of very low grade. There are thousands of quartz ledges in this State that could be worked and made to pay handsomely if the same system was adopted as by the Zeile mine. Quartz mining would receive a wonderful impetus in California if a proper system of mining and milling and the saving of sulphurets were adopted. A good deal of prospecting has recently been done in the Zeile mine. In running north a new ore body was reached and a large amount of work done to ascertain its value. It has been found to increase in size and richness, and the present outlook is that the ore in sight will last for many years. Attached to the mine are chlorination works, which are kept running day and night working from 4 to 5 tons of sulphurets every twenty-four hours, yielding large returns.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

Amador.

VOLCANO.—Amador *Sentinel*, Aug. 29: The hot weather has almost exhausted the water in the streams. The Grass Valley claim has hardly enough water to clean the bedrock which will be completed this week. The Downs mine is working half force, taking out splendid rock, and will have a large amount ready for crushing when water can be had. Terrry Gillick has a crushing ready at the mill. He will crush at the old Stewart mill next week. The tunnel company is fitting up its claim and will be ready for early rains. R. Stewart has found a fine ledge of $25 rock at his mine on the river and is taking out ore and will crush when he can obtain water. The mining outlook was never better than at present.

Calaveras.

MURPHY'S CAMP.—Cor. *Citizen*, Sept. 1: Our mining interests never looked more promising. The Oro Plata mill and chlorine works are running up to their full capacity. Heavy bullion shipments are regularly made. The shaft on the old Blue Wing lode is being sunk as fast as three shifts of men can do it, and is now down near 120 ft. Some excellent ore has been struck at a depth of 110 ft. Supt. Parhani, of the Roble mine, a recent purchase by San Francisco parties, a mile west of town, near the Rocky Bar, and other well-known mines, is in the right locality for a desirable property. This mine has been worked in former years with good results. The company is fitting up a 5-stamp mill. They have 14 men employed in the mine and mill. Sublett & Dodge are running their mill on ore from the O. K. and other mines in the vicinity. The return of prospectors from the new district in Alpine county, called "Green Rock district," from the copper stain in the rock, will doubtless add to the boom, for that part of Alpine will be added to this when Alpine is disorganized. Virgin gold has been found there in paying quantities in the gulches, and Bullion hill seems to be one mass of mineral. The formation is similar to that in Bodie, Lundy and Tioga districts.

El Dorado.

ROSECRANS.—Georgetown *Gazette*, Aug. 31: The Rosecrans mine and mill are running steadily, and the report of the steam whistle falls cheerfully upon our ears. It is reported that the old Taylor mine, near by, is about to be opened up and new works put upon it.

EUREKA.—Last Saturday the steam whistle of the Eureka sounded the welcome news that the pump had been put to work. The mine is now pumped out, and work on the lower or 240 level will begin. The new mill (40 tons capacity) will be ready for trial in another week. In cutting a ditch for sinking the iron pipe to convey water from the main ditch to the Leffel turbine wheel, a three-foot ledge of fine looking quartz was found which proves to be of high grade.

WHIMTOWN.—El Dorado Cor. Placerville *Republican*, Aug. 30: Whimtown is on the famous Greenstone belt, between this place and Shingle springs. The first mine on the Greenstone was discovered by Henry Barnes three years ago. Mr. Barnes has worked his mine ever since with good results. Graham brothers have done equally as well. Fred Tuck has been getting from $5 to $10 to the pan, and only down 20 ft. Briggs & Crane are getting good pay. Hayes, Casey & Co. are sinking a shaft; they are down 25 ft., and have a flattering prospect.

Fresno.

MT. RAYMOND.—Fresno *Republican*, Aug. 25: The principal mines are five miles above Big Tree station on the Yosemite route. The mineral formation extends along the range from five to eight miles and seems to be practically inexhaustible. Some of the ore assays sixty per cent of lead besides paying quantities of silver, while the ore from other mines assays from $75 to $125 to the ton in silver and contains but little lead. Don Pedro, agent for capitalists of San Francisco, is now at the mines, and has bonded several mines at from $5,000 to $20,000.

Inyo.

KEYNOT. *Independent*, Sept. 1: Of late the Lasky mill at Beveridge has not been running very steadily, and has been crushing only 15 hours out of the 24. Since the 22d of July it has reduced 80 tons of Keynot ore, which resulted in 340 ozs. of gold at $14, amounting to $4,760. Twenty-one tons of ore from the True Business mine were also crushed, which yielded 75 ozs. of gold, worth $15 per ounce, amounting to $1,125. The works are now in steady operation, and there is plenty of ore on hand.

Mono.

NOTES.—Homer *Index*, Aug. 25: The May Lundy mine is still running with a light force. The mill is being run up to its full capacity, and the bullion shipments are regular. The Detroit Copper Co.'s furnace, which was shut down for repairs, and to await the arrival of coke, has resumed operations. The Virginia Creek hydraulic mine continues to yield largely, though the supply of water is limited. All the arastras in Lake canyon are running up to their full capacity. The Gorilla M. & M. Co. made its third shipment of bullion for the season during the week.

NOTES.—Homer *Index*, Sept. 1: Very rich ore is being encountered in the Josie Green and Collamer mines, and steps are to be taken at once to open both claims on a more comprehensive scale. The Homer M. & M. Co. has recently purchased several adjoining claims.

STANDARD CON.—Bodie *Free Press*, Aug. 28: During the past week there was shipped to the mills 1,407½ tons of ore. The bullion shipment was valued at $13,663.46. The east crosscut, 1200 level, is in 497 ft. North drift No. 1, 1000 level, was driven 13 ft; total length, 304 ft, showing 2 ft of vein.

BULWER CON.—The west crosscut from the north drift, 700 level, was advanced during the week 12 ft, and it is now in 421 ft.

SYNDICATE.—The mill is running steadily.

BODIE CON.—During the past week there were 136.67 tons of ore hauled to the mill, and 155.925 were crushed. The average assay value of the pulp was $38.27, and that of the tailings was $6.48 per ton. The bullion shipment was valued at $7,072.76.

BODIE TUNNEL.—The west crosscut on the 250 level was advanced 13 ft during the week. The south drift on the 200 level was extended 10 ft. The ledge looks well, and good assays are being obtained,

Nevada.

IMPERIAL.—Grass Valley *Tidings*, Aug. 27: We learn that the Imperial Co. started their pumps this morning, and that in a few days the mine will be free from water. Sinking will be commenced this week.

The Magenta M. Co. have commenced grading for their machinery. To-morrow the steam hoisting and pumping works will be removed from the old Republic mine, and set up on the Magenta, and the work commenced with a single force of men.

PROVIDENCE.—Grass Valley *Tidings*, Sept. 1: If the Providence mine, Nevada City, has been sold, the men who have owned it all along do not know the fact. The newspapers know all about it.

There will be some fine specimens of quartz and gravel gold on exhibition at the pavilion from North Bloomfield.

DERBEC.—*Transcript*, Aug. 29: The new tunnel at the Derbec mine has about 400 ft further to go before it will connect with the most southern drift of the old workings. Some of the richest gravel ever found in that part of the county has been taken out in running this tunnel.

THE PROSPECT.—The mining outlook in the Nevada City quartz district never looked so promising as now. During the past few weeks we have heard of at least a dozen new enterprises. From present appearances this district in another year will need at least a thousand more quartz miners than are at work here to-day.

Placer.

IOWA HILL.—*Argus*, Aug. 30: The Homeward Bound mine is fitting up for next season's work. Dr. Allan Brown, of San Francisco, who is interested, is up watching progress. It is rumored that the proprietors of the Orion will move their pipe across the canyon and commence this winter's operations on the North Fork side of town.

FOREST HILL.—Mr. S. S. Willard, of Forest Hill, is about to open his quartz mine in good shape. A shaft is being sunk, and a new hoisting works and boarding house will be erected forthwith. The mine, which is called the San Francisco, is near the May Flower.

Plumas.

SOUTHERN PLUMAS.—Quincy *National*, Sept. 1: Every old miner in northern Sierra and southern Plumas knows that miles and miles of the old Blue lead lie buried under the lofty ridge, but the buried treasures have waited for the necessary capital. This is now at hand, and some very extensive developing operations will soon be commenced in the Gibsonville and La Porte ridge, and in the Onion valley and Washington hill ridge. The Chicago Co. have drilled many miles of these ridges, and have satisfied themselves in regard to depth and extent. They are now running three tunnels, and more will soon be started.

THE MOUNTAINEER.—A rumor comes that the ground belonging to the Mountaineer Co., at Onion valley, has been sold Eastern capitalists. We hope this is true, for the ground is one of the many claims in southern Plumas which only needs capital to make it produce richly. The old company worked for many years to get in their tunnel, but their purses were not long enough, and they had to stop just when they were nearing the pay gravel.

CROMBERG NOTES.—This section must be on the road to prosperity. Many of our old settlers and old timers are coming back, after an absence of months. Aleck Irwin, Bissell and Bell have arrived lately, and they are all old miners in this section. Charley Hanson is running a tunnel for the Consignee Gravel M. Co. This company have spent several thousand dollars in the search for the rich channel running through this section. Hanson says the rock in the tunnel is very hard.

RICH GULCH.—Cor. Quincy *National*, Aug. 25: The first location we come to is the Hyde quartz lode, commencing at Twelve-Mile bar. Here a little work was done a few years ago, with good results, but as the owner was without capital, no mill was put up. The next is the Hallsted mine, and here a good deal of prospecting has been done. The ledge has been opened in several places, and shows splendidly. I am satisfied that the rock will yield an average of from $8 to $10 per ton. It is from 8 to 25 ft. in width, and can be tapped with a tunnel from 1,000 to 1,500 ft. deep. While I was there, in one of the upper tunnels, Mr. Hallsted found rock that would yield from 25 to 75 cents to the pan, in free gold, without crushing the rock. It was as fine a prospect as I ever saw in any mine. Still further up the gulch we came to Frank Hill's. He has a tunnel in 100 ft, which taps the ledge at 100 ft. in depth. The tunnel was in quartz about 6 ft. The rock prospects uniformly and well. Henry Patten has the next location, and gets splendid prospects from the croppings. His tunnel is not yet in. Fred Lewis has the next location, and gets splendid prospects. Further up the gulch we come to Mr. Cameron's ground, and he has a tunnel in 60 ft., with a ledge 14 ft. in width, and the rock first-rate. The next location is known as the William Penn. Here the ledge shows 20 ft. in width, and with good prospects in croppings, some of the specimens showing free gold.

Sierra.

NOTES.—*Tribune*, Aug. 30: Capt. Mead will begin work on his recently purchased quartz ledge in Pig canyon, soon. The machinery to be used in the Rainbow mine was unloaded there Sunday. One hundred and sixty-eight ounces of gold was cleaned up by the Bald mountain extension last Sunday from gravel out of the South Fork ground. A quartz ledge at Scott's Flat, owned by Casper Bobb, has been bonded to parties from below. A company from below has purchased a quartz ledge east of Cold Spring and commenced developing. Attachments were levied on the Morristown hydraulic claim last week to the amount of $6,000. The suit was brought by employes, to whom the above sum was due in wages. About $20,000 was cleaned up from this mine a few weeks ago as a result of the season's work, and the gold was shipped below.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Enterprise*, Sept. 1: On the 2900 level timbering up the main north drift. Good

pregres is making in sinking the joint Union Con. winze below the 3000 level.

UNION CON.—The joint Sierra Nevada winze below the 3000 level is now nearing the point where should be found the body of quartz and low grade ore passed through by the main west crosscut.

YELLOW JACKET.—Are repairing the main shaft. Are not doing any work underground for the extraction of ore, but some ore is being obtained from the Sagebrush level.

UTAH.—A fan station has been cut out in west drift No. 1 on the 150 level and a fan put in to draw out the foul air that comes in from the old workings below. The ore-house is completed and the ore from the croppings is being dumped into it.

MEXICAN.—The upraise from the 2900 level is nearing the bottom of the winze down from the 2700 level, from which it is draining the water. The rock is still very hard, but contains seams through which the water finds its way. The main north drift on the 3100 level is being advanced 30 ft per week.

HALE AND NORCROSS.—The overhauling of the pumping apparatus at the Combination shaft has been completed and active operations have been resumed in the winze below the 2600 level. The ore still holds in the bottom.

ANDES.—A great deal of solid metal-bearing quartz is being encountered. The quartz is so hard that it must all be blasted.

CROWN POINT.—A tramway has been constructed on the surface conjointly with the Yellow Jacket Co.

GOULD AND CURRY.—On the 1,500 level the east drift is being advanced at the rapid rate of 80 ft per week. It has been cutting streaks of fine looking quartz. The ground now being explored eastward is very promising.

BULWER.—The dumps are full of ore, and work will not be resumed until there is sufficient water to run the mills to their full capacity.

IMPERIAL.—The work of overhauling the gallows frame at the Imperial hoisting works is about completed.

ALTA. Bailing tanks have reduced the water nearly to the 1200 level. The pumps will soon be started up.

UTAH.—The north lateral drift on the 1350 level is being advanced at the rate of 30 ft per week.

SAVAGE. Nothing is being done on the 2600 level, but a start will be made at that point soon.

CALIFORNIA. The joint Con. Virginia drift is completed and is taking up the water to the 2800 tank.

CON. VIRGINIA.—The joint California drift is completed and is conveying the water to the 2800 tank.

CHOLLAR.—Crosscutting will not be resumed until the new hydraulic pump has gone into operation.

BEST AND BELCHER. The water is being allowed to drain out of the west drift on the 2500 level.

SCORPION. The west drift on the 500 level is cutting occassional streaks of clay and quartz.

UNION SHAFT. Are still repairing the 2300 station

Belmont District.

ARLINGTON. *Courier*, Aug. 25: The Leaching works in Nye county are producing fine bullion. The owners, Geo. Nicholl & Co., shipped yesterday one bar of bullion weighing 1,345 ounces, 963 fine, and valued at $1,674.66.

NOTES.—The mines in Northumberland district are yielding good ore. The company shipped three more bars of bullion on Tuesday last weighing 271 pounds and valued at $4,309.66. George Nicholl informs us that the outlook in Western Nye is good. The Ellsworth mill is being repaired, and will be started up on ores from that district, of which there are large quantities on the dumps. Everything is moving along finely at Ophir canyon. The Twin River M. Co. shipped another bar of bullion on Tuesday last weighing 94 pounds, valued at $1,389.77. The Jefferson mill is running, and the company shipped several bars of bullion during the week. George Nicholl & Co. have 2,000 tons of pay rock on the dumps in San Antonio district. In the Belmont mine, good ore is encountered daily. Some of the mine owners in Ione district will have their ores leached at Ellsworth.

Bernice District.

NOTES.—*Silver State*, Aug. 28: From Bernice district, the *Reveille* learns the following: The Wild Goose mine, owned by Charles Jourdan & Co., has a tunnel in 200 ft, and is opening up a splendid ledge. The ore runs from $100 to $200 per ton. They have 100 tons on the dump ready to be milled at the Bothwell mill. Gilbert & Hoyt have a tunnel which taps excellent sulphuret ore. They have three men stoping and are getting out fine rock. They sent 30 tons to Salt Lake for reduction, and realized satisfactory returns. They have just started a tunnel 100 ft lower which will tap the ledge at 300 ft. About 10 tons of ore is on their dumps. Wallace Goodell, the owner of the Golden Crown mine, has the best property in the district. The ledge is three ft thick, and is very rich. He keeps four or five men at work taking out ore, and has 200 tons now on the dump. His rock is free milling, while that of the other mines needs roasting.

Esmeralda District.

SILVER STAR.—Hawthorne *Herald*, Sept 1: About 15 miles south of Luning, is one of the largest bodies of copper ore in the world. Parties who have visited the ledge say that it is indescribable. There are two parallel veins running easterly and westerly that crop out in places over 100 ft deep. Furrows have been cut down through the exposed ledge by the action of the elements and all through as far as exposed it is one mass of copper ore. Several hundred tons have been taken out of various parts of the lode that runs from 10 per cent to 60 per cent per ton. Dunlap, Menzie & Abrahams the owners, have bonded the proprrties to Giles & Garvin for $40,000.

COPPER.—The Mount Vernon Copper Works at the mouth of Mill creek, Mono county, are shipping from 15 to 20 tons of crude copper bullion weekly to Oakland for refining.

WABASH.—*Ledger*, Sept. 1: This mine is south of the Talisman, between Sutter creek and Amador City. It is owned by Cal. Hammack and others. Some four or five years ago it was worked on a small scale by an arastra, and the rock paid well. Recently work was resumed on a different part of the mine. A tunnel has been run into the hill. One day last week a crosseut encountered a ledge 20 inches wide with a regular gouge. This vein is exceedingly rich, showing free gold in abundance. Parties who have examined specimens estimate that it will go $1,000 to the ton. This strike is considered of much importance.

MIDDLE BAR TUNNEL.—The contract for the first 1,000 ft was signed last Tuesday. Fox & Claich are the contractors. It is found that the muddy water as it comes from the ditch will not answer for the air compressors. A large tank is, therefore, being constructed in which to settle the water.

NOTES. The first clean-up of the 5-stamp mill on the Hageman, Malsom & Fleming claim, near Butte City, was made on Tuesday, and turned out exceedingly well. The Stewart boys are getting out some fine looking rock from their claim close to the Hageman. The Jackson mine is employing 15 men. Mr. Hayward inspected the mine this week, and it is understood that he contemplates buying an interest. The crushing of the rock at the Oneida is still in progress. On the Mahoney the judgment creditors have advertised the mine to be sold by the sheriff on the 17th of September. This time they are determined to get their money. There is a movement on foot looking to another compromise. The Benjamin party are willing to put up $10,000 to work the mine, if the creditors will release the property and consent to wait for their money. The creditors, outside of the lien-holders, are willing to fall in with the arrangement, but it is doubtful if the others will consent. The Sutter creek sulphurets works, now owned by C. J. Nickerson, started up a week ago on sulphurets from the Bunker Hill mine. The quantity to be treated will take 10 weeks to dispose of.

VOLCANO. *Dispatch*, Sept. 1: I. Gillick is now ready for crushing. He has a good deal of rich rock out, and has four men employed. The Stewart mine, on the Mokelumne river, is looking well. Jake Griesback is running his arastra on Pioneer creek.

Eureka District.

EUREKA CON.—*Sentinel*, Aug. 29: The principal interest in this mine just now is with regard to the fight against the water in the new shaft. Mr. Read, the superintendent, tells us that it is only a question of time when the mine will be drained. The machinery is working well and the water is being lowered all the time. He is satisfied that the flood is confined mainly to the ledge. As an indication of this the water in the old workings has gone down from above the 1,200 level to about the 1,300, and the shaft in the Phœnix has already been pumped dry.

Paradise District.

BULLION. *Silver State*, Aug. 27: Yesterday J. V. McCurdy shipped one bar of bullion, valued at $2,111.27, to San Francisco. This was the second shipment from the Paradise Valley mill since Mr. McCurdy assumed the management.

Ploche District.

DAY.—*Record*, Aug. 25: They have encountered copper ore on the sixth level of the Day mine, in working around the ore chamber lately struck. It is on the east side of the chamber. The foot of this copper ledge is three ft in width. From selected ore, a test made by Supt. Grim, showed 70 per cent copper. A person, on looking at the sample, would take it to be mostly lime. The whole ledge will go from 35 to 45 per cent copper, and about $40 in silver.

Tuscarora District.

BASIN MINE.—*Times-Review*, Aug. 28: Although the mill is idle on account of scarcity of water, a shaft which is being sunk a hundred feet above will in a few days furnish the necessary supply, and the stamps will be set in motion about the first of the month.

SHIRT ANCHOR.—The owners of this mine are having the shaft cleared of water. The ledge at the depth of one hundred ft is four ft in width and well defined. The rock carries gold and improves as depth is attained.

White Pine District.

TAYLOR.—*News*, Aug. 25: The Monitor Co. knocked off 12 men on the first of August. They have lots of ore at the mill and mine. The Argus mill is going up slowly. It will not be completed for three months at least. All the mines here are looking well, and our prospects for the future are good, and the croakers, who always predict disaster to any enterprise, are not likely to have prophesies of ill-omen vertified in Taylor for several years to come.

ARIZONA.

UNITED VERDE.—Prescott *Courier*, Aug. 20: The United Verde Co.'s smelter is running out 16 tons of copper daily. It is in the Black Hills 17 mills north east of Prescott.

DOSORIS.—The Dosoris mine, south of Prescott, is now at a depth of 400 ft, glittering with brittle silver. Never before has it looked so well.

TIPTOP.—We heard, Saturday, that sinking in the Tiptop mine, is now pleasant and profitable. The men have very rich quartz at a depth of 700 ft.

RICH ROCK.—E. Stahl, of the Prescott Assay Office, has just tested quartz brought from a distance of 40 miles from Prescott. A careful assay showed it to carry $4,735.08 per ton in gold, while there are in this amazingly rich rock streaks of telluride, worth $100,000 per ton in gold. The finder of this rock may have told Mr. Stahl all about its location, but if he has Mr. S. would not tell our reporter. Gentlemen who recently examined Philip Richardson's Gray Eagle mine, Bradshaw district, wonder why it is that a mine of its great size and richness is allowed to lie idle.

TINTO BASIN.—C. C. Hyile, who has charge of the Excursion mill, says the gold mines of the Mazatzal mountains are good. A New York Co. owns the mill and a group of mines, the best of which are the Excursion, opened to a depth of 150 ft; the Summit, the American, the Dollar and a mine which formerly belonged to Brown Bros. Dr. W. W. Jones is superintendent of mill and mines.

BLACK HILLS.—Gentlemen who reached Prescott yesterday from Black Hill's district tell us that the smelter ran out 10 tons of copper in 24 hours. Coke is scarce.

NOTES.—Final *Drill*, Aug 25: The Frankfort is cleaning out the shaft and tunnel. On the Australia work continues; good ore found all the way. The Bilk and Mowry are repairing damages from the storm. The Silver King is also repairing the mischief of the storm. Mill runs as usual. The storm has not interfered with the hauling of the ore to the mill. In the Monarch of the Sea they are cleaning out the shaft after the storm and clearing out the fine new road now almost obliterated by brush, bowlders, wash outs, etc. They will soon have steam hoisting machinery. On the Nacoochia work has been discontinued, to be resumed soon, but on contract. The shaft is now 67 ft deep. Fine smelting ore was obtained. They have found the foot and hanging wall. On the Specie Paying, the work has been discontinued, all the attention being given to the boring of the well, which began on Friday of last week; it is situated at Cottonwoods, half a mile from the mine.

BELLE.—The Belle mine has bulged so that a small force of miners take out more ore than the smelter can get away with. Sixteen mules, drawing 16,600 pounds of bullion, started from the smelter, yesterday.

COLORADO.

ISMAN. Georgetown *Courier*, Aug. 23: The Inman lode, a recent discovery on Chicago creek, assays 405 ounces silver and four per cent copper at grass roots. The vein has been opened up at intervals for 300 ft, and is not less than 6 ft between walls in any place, and carries from 4 to 9 inches of mineralized quartz. It is owned by R. B. Griswold and son.

EXCELSIOR MINE. *Gazette*, Aug. 25: The vein is from 6 to 8 ft in width, having porphyry for hanging wall and micaceous rock for foot wall. Mr. Collom now has a shaft 80 ft in depth. A recent mill-run gave a return of $118 per ton and another shipment will be made in a few days.

QUEEN.—The Queen mine on Seaton mountain is constantly improving. The ore averages $150 to the ton and is increasing in quantity.

NOTES.—An assay from the South American lode on Ute creek gave 230 ounces silver. This property is owned by Sporborg & Fallon. The Meade boys have three inches of gray copper and sulphurets in the Rochester lode, which give an average of $250 per ton. The last shipment from the Tropic was five tons, which made a return to the lessees of about $700. The Little Mattie made a shipment of three carloads of high grade ore this week. This month there will be 100 tons shipped. An assay made on ore from the Sheldon lode ran 258½ ounces silver, 2 2-10 ounces gold.

SUMMIT CON.—Georgetown *Miner*, Aug. 25: General Lord struck it rich again on Tuesday. Sulphurets, crushed with the gangue, ran 896 ounces in silver. Of course the sulphurets by themselves would run high in the thousands. Even the latest mill runs from the summit proper, 11 ft distant, were: first-class, 2,155; second class, 449 ounces. Our reporter was shown specimens which assayed: One 6,574 ounces; another, on a different vein, 90 ft up the shaft, 4,440 ounces; a third, from a one-hal finch ore streak, 3,700 ounces. From the Precinct, 90 ft northeast, were seen specimens equally good. From the upper level of the 171 ft shaft, at a depth of 110 ft, came specimens which had been exposed to a forge fire. Beads of silver had bubbled out as big as shirt studs, and one bead left a mark on the stone on which it fell as large as a three cent piece. General Lord is astonished himself at the quantity and richness of the mineral.

IDAHO.

SMOKY BULLION.—Wood River *Times*, Aug. 22: If snow does not fly too soon, Mr. Martin says the concentrating works will be ready this fall. The wagon-road is completed to within three-quarters of a mile of the mines and within 10 days a buggy can be driven clear up to the mine dumps.

PRIDE OF IDAHO.—A rich strike is reported in the Pride of Idaho mine. The average assays give 240 ounces in silver and 68 in lead to the ton, with a strong body of ore in sight. Ore is being sacked for shipment to the sampling works.

BIG CAMAS.—Matthew Williams arrived in town to-day from the Big Camas mine. The shaft is 20 ft down on solid quartz. This mine has a wonderful outcrop. The quartz stands up above the country rock, from 2 to 6 ft high, and 20 to 60 ft wide, a distance along the vein for 600 ft, and the 20-ft shaft is in the same quartz. All the quartz assayed returns $75 in gold and 13 ounces in silver per ton, and 300 tons of such quartz could be delivered immediately to a mill. The outcrop, for 600 ft in length, has not a break. The walls are 40 ft apart, the vein solid pay quartz, and a 20-stamp mill can be kept at work the year through. The mines are not over 12 miles west from Hailey.

SAWTOOTH.—The Eureka mine, under lease to Colonel Broadhead carries a rich streak of silver ore, samples of which assay $2,000 and even $4,000 per ton. The Sawtooth mill started running on Tuesday. At Vienna the company's mill has been running steadily for six weeks. The first week it ran on low-gade stuff. Since it has been running on good ore, the mill has yielded 16 bars of bullion worth an average of about $1,500. This is at the rate of about $750 per day. The mill having a capacity of 20 tons, this indicates an average yield of $37.50 per ton. Of the 20 tons worked daily, 12 are from the Mountain King and 8 from the Vienna—both of which are the property of the Vienna Mill Co. The King ore is of low grade, while the Vienna is rich, and by mixing the two a good result is obtained. The cost of mining and milling should not exceed $20, and thus leave a profit of $17.50 per ton.

SMELTER ITEMS.—Ketchum *Keystone*, Aug. 18: The bullion output from the new furnaces ranges from 350 to 450 bars daily, with an average weight of 100 pounds, making about 20 tons the total yield. The 40-ton furnaces have been idle a day or two to admit of repairing broken machinery and connecting the east furnace with the main dust flue. They will be put in operation soon.

ELKHORN.—Ketchum *Keystone*, Aug. 22: Judge Lewis has several pieces of native silver from the Elkhorn vein on the slope between tunnels No. 1 and 2. He has one piece that will weigh nearly an ounce and is pure, white silver; a beauty. Flake silver is quite common on specimens of the galena taken out.

BANNER.—*Tri-Weekly Statesman*, Aug. 25: This mine is developed by a tunnel 900 ft long, is all opened out, and is one of the best worked mines within the Territory. They are working 38 men, which keeps the 20-stamp mill running day and night. The average battery assays yesterday ran a little over 500 ounces silver per ton. The company owning this property are from Elmira, N. Y. They purchased it for $40,000, and in less than a year paid for it from the mine, and declared a dividend of $90,000. The output this year will reach $250,000.

MORE ABOUT THE BANNER.—Hon. James H. Hawley came down from the basin on Saturday. Mr. Hawley speaks in glowing terms of the Banner district. In the Banner mine the shaft is down 400 ft, revealing high grade ore, containing ruby and wire silver and sulphurets. The 20-stamp mill is kept busy on first class ore, with an average daily result of $1,000 net. This rich district is so completely hidden away in the mountains that very little is known of it.

MONTANA.

ALDER GULCH.—Butte *Miner*, Aug. 25: The Prospect mine, jointly owned by Mr. Layton and S. E. Rice, is looking better than ever. The rich pay streak in the 400 is yielding $2,000 ore, in which gold predominates in the proportion of about $1,100 gold to $900 silver. A winze has been sunk to the 500 level, where the ledge, 14 ft wide, assays 200 ounces. No water has been struck at a depth of 500 ft. The high grade ore is shipped to the refinery, and the low grade will be concentrated at the new works.

HENDERSON GULCH.—Cor. of *New Northwest*, Aug. 24: Mining is active in the western part of Deer Lodge Co. Prospectors are all busy and others coming in every week. Dr. Price S. Gaylord, who came to Montana in 1864, and went back to the States in 1873, returned two weeks ago, and has taken up his old residence in Henderson Gulch, together with his mining property, placer and quartz. He has one quartz lode which he thinks will be a bonanza yet. Twelve years ago he got assays from it which went over $200 in gold. This is the ledge from which the gold is supposed to have come that was taken out of the placer diggings in this gulch.

TIDAL WAVE DISTRICT.—Butte *Miner*, Aug. 22 Everything seems lively now, and prospectors are striking new leads daily. Ore can be found in this camp that assays as high as $6,000 and $7,000 per ton. The gold mill recently erected is having a steady run on ore from the Two Dans and Melrose leads. The first day's run cleaned up over one lb. of gold.

NEW MEXICO.

LAKE VALLEY.—*Southwest Sentinel*, Aug. 22: On Monday, the 20th inst., Frank J. Wright, special master in chancery, sold the Columbia mine at Lake valley, for the sum of $30,500.25 cash, the purchaser being the Sierra Bella.

NOTES.—Las Cruces *Republican*, Aug. 25: The new smelting works at Santa Fe, owned by the Chicago & Santa Fe smelting Co. are completed and will be started up as soon as the contracts for ore are closed. The Leer, Glass & Griffin ten stamp mill at White Oaks is pounding away on gold quartz from the North Homestake. In the Silver Gem they have stopped work in the tunnel, and are working in the shaft, which is down 30 ft, and on mineral quite as rich as the ore in the tunnel. The Black Range mourns over the dullness of its mining camps, which continues in spite of the good prospects for mineral there.

NOTES.—Kingston *Tribune*, Aug. 23: Ten tons of ore from Bremen's '76 mine, Silver City, N. M., averaged $800 per ton. Some of the richest gold ore yet discovered in New Mexico was found in the Pinos Altos range, in Grant county. The ore is composed of quartz and iron, and entirely covered with flakes and nuggets of rich metal. Dr. C. E. Smith and B. F. Kelley have located several claims in the neighborhood of Eckles camp in the Burros, that are looking fine. J. M. Purdy has returned to Socorro from the Black Range. He is preparing to erect hoisting works on the German mine. The official statement of the Treasurer of the Sierra Grande Co. for the first fifteen days of August, 1882, shows $62,956.71 from sale of bullion, and a total for the month of $134,306.33. While this is fair, the month this year shows a vast increase. Alex. Waldschmidt, who represents the New Mexico Silver and Copper Mining Co. on the Bonito, sent specimens to Kansas city for test and recived a return of sixty-five ounces in silver for the lowest grade, and 300 ounces as the highest. The Income Mining Co. will soon resume operations on the celebrated Sherman mine, near Silver city. This property is, with one or two exceptions, the best near Silver city.

OREGON.

NOTES.—Jacksonville *Times*, Aug. 24: Geo. Ross will start up the quartz mill in Blackwell district, there being plenty of water in the shaft. Winters & Sons of Josephine county have about finished cleaning up. The tunnel that taps Geo. Schumpf's ledge in Willow Springs precinct is 310 ft long and the shaft 106 ft deep. Alzono Sturgess, who is working the old Capt. Acorn diggings on Jackson creek, found a crevice not long since which contained $90 of beautiful gold. Will. Brown, superintendent of the nickel mine near Riddle, has returned from San Francisco, where he had a quantity of the ore smelted. He exhibited to us a bar of the metal, which is pure. A correspondent of the *Times*, writing from Josephine county, says that the company mentioned as having struck big prospects on Althouse is composed of John Swan and others. They are prospecting the "big slide," and have got as high as $5 to the pan.

UTAH.

EMMA.—Salt Lake *Tribune*, Aug. 30: A shipment of 15 tons of $160 ore has just been made by the Emma, and we learn that others are to follow. The 135 level is now opened 80 or 90 ft west from crosscut and 125 ft east. The ground is described as the most promising in appearance of any that was ever found in the mine. The vein is 150 ft wide, however. They may run into ore at any moment, and again may pass by and miss it. After being driven a suitable distance the vein will be crosseut from this level at points, enough to thoroughly exploit the ground. We do not know that a share of stock in the Emma Co. is owned in Utah, but the effect of finding a new body of rich ore in it would be such on the mining interests of the Territory, and we might perhaps add, on many men's reputation, that exploitation is watched with the greatest interest.

Examination of the Carson Footprints.

Report of Prof. Geo. Davidson, President California Academy of Sciences—Read August 6, 1883.

Upon representing to the Board of Trustees that more footprints had been laid bare within the State prison limits near Carson, Mr. Gibbes and myself were authorized by the Board to proceed to Carson and make an examination. By arrangement, Prof. W. P. Blake, of Yale College, accompanied us, and promised to make a report of his views. But the work of all was in great measure inseparable, except that Mr. Gibbes remained one or two days beyond our time, in order to make some casts. The descriptions of all can therefore differ but slightly. It is left, however, to each to draw his own conclusions. A detailed description of the locality and of the peculiarities need not be introduced, because they have already been in great measure presented to the Academy by Messrs. Harkness, Le Conte and Gibbes. What strikes the visitor at first is the fact that the friable materials of the two "floors" heretofore referred to are liable to dislocation and

Destruction by Weathering,

Cleaning, and the ordinary traffic of working convicts and visitors over them. And I must confess to some disappointment in not seeing more marked characteristics of the footprints on the lower floor, because in the published drawings there is no varying degrees of designation to footprints that are deeply imprinted, or to those that are barely traceable. Of this, however, I shall speak hereafter. But I was very strongly impressed with the vividness of some of the impressions on the upper floor, and of their teachings; and fearing that they would in time lose their great value in the earth's natural history, I made arrangements with Mr. Frank Bell, the Warden of the State prison, to have them reproduced by making casts of the more important. And here I wish to express the thanks of the party to Mr. Bell for his prompt and intelligent assistance, and for his his generous, entertainment during our stay. To him and his officers we owe acknowledgment for their interest in searching for and preserving every probable footprint, fossil shell, fragment of bone or tusk, and casts of pine cones.

Mammoth Remains and Rain Drops.

One of the first things to strike the eye upon entering the prison precincts, is the thin layer or stratum of hard clay immediately over a thirty-foot stratum of fine blue sandstone. On this clay layer are sharp and deep rain drops or hail markings, which are found even in the faint impresses of a mammoth's feet, leading to a point where the same surface is not marked by such rain drops, but is irregularly smooth, as if lain upon by a huge body some twelve feet in extreme length by about three feet in greatest width. The foot prints are eighteen inches in diameter, and I did not notice any beyond this peculiarly marked spot. In the history of the earlier excavations it is said that a mass of bones was found at this spot, and removed as if of no merit.

And it is also reported that ten years since there was found, at a locality not accurately known, an elephant tusk, or a part of a tusk, which was ten inches in diameter at the base, seven and one-half feet long to the point, which was the thickness of a man's wrist and turned up

Megatheroid Footprints—the So-called Man.

But leaving the fainter and more doubtful marks and tracks which one soon learns to trace out and identify, I come to the two principal series of tracks, important both on account of their size and their preservation.

One of them is the series designated No. 1 in Mr. Gibbes' canvas drawings and in the published plans. This series is in a great measure protected outside the present face of the cliff by a wooden cover which is only raised when visitors are examining the foot prints; but Mr. Gibbes says that these tracks are certainly not in as good condition now as they were before the last winter. And it is reasonable to assert that with every rain, with every frost, every new cast made, every personal examination by inquisitive and sacrilegious hands, these hieroglyphics must suffer in sharpness and accuracy of detail.

The animal which made these footprints appears to have been moving from the cliff outward—using the term cliff for reference only—and since the first visit of Dr. Harkness and Mr. Gibbes and Prof. Le Conte, a short drift or tunnel has been run into the cliff exposing other footprints and also the footprints of a mammoth intermingled.

The indications point to the great probability of the two animals being there at or very near the same time, because one of the footprints of the mammoth obliterates one of the footprints of the preceding animal.

And here it is proper to state that I use the term mammoth provisionally. The diagram designated series No. 1 continued, illustrates nearly to scale this combination of footprints; those only partly exposed are to be uncovered in the casts.

Upon a minute examination of some of the footprints of the first animal or the so-called man, and the material in which these prints were made, a very striking fact was demonstrable.

A lower stratum of mud had been formed, had dried considerably, and the surface was seemingly quite firm, suffering very little impression to be made in it. Above this had been deposited another layer of mud about three-fourths of an inch thick and apparently quite soft. There is no doubt on this point of the two layers, because the upper layer of three-fourths inch is in parts removed and is removable, and is in places lying ready to be swept away, so that there is no assumption of the existence of these two layers. The existence, consistency, and relation of these two layers is very important in a study of the footprints. The foot of the animal in its deliberate walk, and with its great weight, would very easily press from under it all, or nearly all, of the material of the softer upper layer, especially if the lower layer were unyielding or nearly so. And if this upper soft layer were not yet "set" it is very likely that part of the material would settle back when the foot was removed. Moreover, if the lower layer were in that stiff, yet sticky condition which most of us have experienced in walking, riding or driving through adobe soils, there would be occasional lifting up of some parts of that layer by its sticking to the sole of the foot.

Now, upon careful examination, this result is clearly exhibited in several of these footprints; the foot pressed the softer material of the upper layer from under it and rested on the stiffer layer beneath it, and when the animal raised its foot the softer material, though quite soft, was not thin enough to flow back into the print, so that a fair marginal edge may, in some instances, be traced. Again, when that foot was raised, or when the second foot was raised from the same track, it lifted with it an irregular area of unequal thickness from the more tenacious layer beneath. In some places this removed area goes out to the border of the imprint, and in no two instances is it identical in shape or location. Where the surface of the lower stratum is not wholly removed by such adhesion of the stiffer mud to the sole of the foot, there is, in some cases, a narrow border a few inches long and an inch or more in breadth of it smoothed apparently by the slightly forward or backward slip of the foot when lifted, just as would happen to-day to an animal walking over a stiff adobe soil. The soft unctuous character of the upper stratum naturally aided this slipping movement, no matter how little it may have been.

It is these pieces of smoothed, narrow border which have been aggregated to form the sandaled foot of a so-called man. But I am convinced that a study of the facts which are now presented, and the whole appearance of the surface roughened by the lifting of part of the lower stratum, lead to the conclusion that no sandaled foot was necessary to produce the impression indicated. Other facts to be mentioned will sustain this deduction.

Two or more foot prints exhibit other interesting minutiæ of detail. At what may be supposed the heel of the animal's foot, the inner sloping of the soft marginal mud shows distinctly a series of lines as if made by a mass of hair or other similar material attached to the foot; and at what may be supposed may be the toe end of the animal's foot, the inner sloping of the same layer of softer mud indicates that when the foot was lifted the forward part had a slight movement inward.

I examined these markings carefully to see if, by any possibility, minute remains of hair or other material might be still attached to the mud. And where so much of interest is centered it seemed exceedingly important that a member of the academy should be present whenever any new drifts are to be made because the minutest details should be gathered. This was carried out at the opening of the last two mammoth tracks, when Dr. Harkness and Prof. Joseph Le Conte and Mr. Gibbes were present.

In this series of tracks it may be safely asserted that there are no two which are exactly alike in outline or imprint, whatever significance may be attached to that fact.

In the line of these tracks, or at least in the pathway of 20 of them, reckoning from the half-exposed one in the drift, there are no other tracks except the three or four mammoth tracks at the drift, or tunnel under the cliff, and some bird tracks from the heel of the ninth to the toe of the tenth animal track. These bird tracks will be referred to hereafter.

This series, as heretofore described, is on the "upper floor," two feet above the "lower floor" of the published diagrams, and on the same "upper floor" are the imprints of the mammoth line. This series has no designating number in the published diagram.

Footprints of the Mammoth, or Elephant

In the series of mammoth tracks, and I think we may safely assume them to belong to some species of elephant, I selected a line of ten for casts. These tracks are not of uniform depth on account of the partial destruction of the different layers of mud through which the animal's feet pressed. Those imprints farthest away from the present face of the cliff are discernible through the lowest layer of mud; and they rested upon a subsurface ripple-marked stratum without obliterating or changing any of the ripple marks. This substratum had, therefore, been hardened before the animal walked over it. As we approach the face of the cliff the imprints are more distinctly exhibited and we are able to measure the inside diameter of the foot at right angles to the line of march at 21 or 22 inches. Between the fourth and fifth imprints, reckoning from the last ones exposed in the drift or tunnel under the cliff, there are footprints of the same species of bird which has marked the surface in so many places.

The two last exposed mammoth footprints are within and under the cliff, and although the outer one is not so perfect as the inner one, yet each indicates that the foot pressed through about four inches of mud and raised a moderately broad margin of one inch in height, thus making the apparent depth five inches; and this depth was not in one layer of mud, but at least two are indicated by the annexed drawing. These are the two tracks which were first exposed to Dr. Harkness, Mr. Gibbes and Prof. LeConte, and described by them.

In the outside tracks there is nothing to indicate in which direction the apparently round-footed animal was moving; but in the two best preserved examples there is a decided duplication on the margin of each in the line of march, but not extending to the depth or the breadth of the whole foot. The footprint exhibits the exposed addition as a segment having a chord of about one-third of the diameter, or less than one-half the diameter, of the main imprint. Each of these two principal footprints is twenty inches across at right angles to the line of march.

I examined carefully for finer markings on the margins of the prints, but could see no evidences of any other indentations as if from toe-pads, etc. This addition at the margin either indicates the duplication of the footprint, or it affords a clue to the shape of the foot. The hind feet would appear to have stepped into the print of the forefeet with great regularity, but I could see no evidences of any other indentations, as if from toe-pads, etc.

It would be extremely interesting to have at least two more of these footprints exposed, and that the members should again scrupulously and minutely examine them when they are brought to light, and at once obtain casts under the most favorable conditions of freshness, etc.

Tablets of the Footprints to be Made.

These two series of great footprints just described seemed to me so valuable in paleontological investigations that I laid down a plan to reproduce them as nearly as practicable in their present condition and relation. For this purpose Messrs. Blake and Gibbes and myself have measured a line through each, and at each footprint in the first series described, and including the well marked birds' tracks, a series of determined offsets indicated by drilled holes, has been so arranged that each plaster cast will contain two of these holes, and each footprint will be numbered.

From these casts we hope to be able to reconstruct, in sections, a tablet for series No. 1, not less than forty-six feet long and three feet wide for the greater part, and about six feet wide at the part under the cliff, where the two animals crossed in their march.

In the line of mammoth tracks, a central line was laid down, and offset measures will be made at each imprint to properly locate and orient the same. The length of this series will be about forty feet, and should two fresh tracks be uncovered, it will reach forty-nine feet in length.

That these representations of the actual tracks will be of great importance, goes for the saying; and already inquiries have been made for copies on behalf of the Smithsonian Institution, for the museum at Paris, for the Central Park, New York (through D. O. Mills), etc. This work is now being done under the direction of Mr. Frank Bell.

Length of Stride, etc.

As determined by Mr. Gibbes, the pathway of the mammoth tracks is about thirty-six inches broad, and the breadth of what has been denominated the straddle is nineteen inches. My measures of the average longitudinal distance apart of the imprints of the eastern steps is, for five spaces, eight feet eight inches, and for four spaces of the imprints of the western steps, is eight feet nine inches. The imprints are not evenly separated, the range being nearly two feet.

For the quadruped of the first series, the so-called man, the longitudinal distance apart of the imprints of the right feet for nine spaces is four feet ten inches, and for nine spaces of the left imprints, four feet nine inches.

I did not measure the breadth of the straddle of this series, being satisfied with Mr. Gibbes' previous measurement of nineteen inches, which is the same as that of the mammoths.

Footprints of the Elk.

The next series of tracks that we measured were those which Prof. Blake and myself provisionally, and for reference only, have denominated the elk. But there is no proof whatever that they were made by an elk. We could not make out any one footprint specifically, because the mud layer had been too soft and deep, and the animal evidently had sharp feet, or hoofs, which went down deeply, as if the animal were quite heavy. But we felt satisfied of the direction in which the animal was moving. We did not preserve the strict line of march of the animal, but measured the distance apart of the consecutive imprints and the breadth of the straddle.

The imprints appear to have been made by a second foot treading in or very nearly in the track of the first. The prints average 4½ inches long and 3½ inches broad. The breadth of the straddle is 13 inches, and the longitudinal distance apart of the imprints of 7 tracks on one side is 6 feet 2 inches, and of 6 tracks on the other side is the same.

The diagram exhibits the distances measured from one footprint on one side to the next footprint on the other side, and these distances are laid down for an average pathway. Five feet from the line of the above prints were footprints which might have been made by a deer or some similarly cloven hoofed animal.

(CONCLUDED NEXT WEEK.)

Forestry Notes.

The Forestry Congress which recently assembled in Wisconsin passed a resolution recommending the establishment of an Arbor Day in each of the United States and Canada. What is meant by Arbor Day is some suitable day appointed by the Governor of a State upon which there is a universal planting of trees on one's own land by the owners, in parks by corporations, in school grounds by school boards and pupils—in short, so general attention to the subject of tree planting as shall work favorably in what is called village improvement, the cultivation of different species of trees by farmers as crops, the beautifying of highways, etc. Some States already have Arbor Days, and the institution works well and leads to the planting of many trees. There has been some agitation of the subject in this State, and some effort in the right direction. The Congregational Church of Berkeley observes Washington's birthday as an Arbor Day by meeting in the afternoon for the planting of trees, shrubs, flowers, etc., upon the church grounds. Washington's birthday, in the greater part of California, is well placed for tree planting, and the close connection of a tree with the early history of the great patriot makes such a ceremony on his birthday quite appropriate.

The Forestry Congress also recommended that the members represent to the States the necessity of establishing forestry experimental stations and memorialize the legislatures of the different States, urging upon them the practicability of establishing these stations. The report also recommends that experimental stations center in the agricultural colleges.

The committee on memorializing State legislatures upon the establishment of State forestry commissions reported memorials, calling attention to the importance of giving early attention to measures for the maintenance of forestry supplies, and to the relations existing between a due proportion of woodland and agricultural welfare of the country, water supply, etc. In view of the fact that the most settled portions of the country were owned by individual proprietors, the report states that the most effective way of promoting tree culture is the diffusion of correct ideas among the owners of land. This end would be best achieved by the appointment of State commissions to introduce a new variety of trees, keep people informed on the best method of tree culture, establish nurseries and experimental stations, and hold meetings. In this connection it is of interest to state that forestry is not being neglected by the Republic of Mexico. An exchange says:

The government has lately contracted with Mr. Oscar A. Droege to plant 2,000,000 trees in the valley of Mexico within four years from March 15, 1884—500,000 a year—in such places as the government shall choose. The contractor pledges himself to establish a number of nurseries and to have in them each year at least 800,000 ash, 35,000 willows, 120,000 poplars, 60,000 encalyptus trees, 60,000 trenos-japones, 60,000 mountain cypress cedars, 60,000 acacias, and 120,000 of miscellaneous varieties. The trees must be in plantations of from 50,000 to 100,000 each, and Mr. Droege has to maintain them for two years after planting. He is not compelled to plant trees along the highways, however. Three graduates of the School of Agriculture are to be received into the nurseries each year, there to study the science of forestry. He is also to raise fruit and other useful plants for free distribution. The contract also provides for the translation from the German of a recognized work of merit on forestry. An inspector is to superintend, and Mr. Droege is to receive annually $40,000 till the sum reaches a total of $200,000.

A BIG IRON MINE.—The Sierra Valley (Cal.) *Leader* learns from reliable authority that the great iron mine near Mohawk valley is about to pass into the hands of a syndicate of Boston capitalists, who propose to proceed to develop it. It is undoubtedly the largest body of iron ore on this coast, and is inexhaustible, and further than that, the quality is better than any ore in the United States, being the same as that from which the celebrated Russian and Swedish iron is made. It has been lying idle because there has been no means of transporting its products, but now a railroad is proposed from some point on the Central Pacific, to run through Sierra valley, tapping its agricultural resources and the immense tracts of timber in the vicinity, and thence into Mohawk valley and the mine. A surveying party may be set to work this fall making the preliminary surveys, and it is thought that within two years the mine will be turning out its products to the world.

WHEN Sherman fought and won and the news came into a distant desolate country in Idaho, the old miners said it was "a big thing." The discovery of a new ledge from fifty to seventy-five feet wide was also "a big thing," and so the ledge took the name "Atlanta," and the town was thus called from the ledge. A number of mines are located on this ledge. The largest, perhaps, is the "Atlanta." It has large hoisting and pumping works, a shaft 400 feet deep, a mile or more of drifts and tunnels, two mills, and has taken out more than $1,500,000 in gold and silver ore of a high grade. The ore bodies now uncovered are immense. A new mill will be put up early next spring with increased facilities for reducing ore.

THE ENGINEER.

New Forms for Boats.

Two boats have been recently chronicled in the papers which make in each case a decided departure from the old type, and we may say the stereotype, which has to a certain extent ruled all ship building from the day of Noah down. For much as models vary, they all seem to be planned on one principle—the boat must take *deep* hold of the water; and especially is this held to be true in the rough service of the open sea. In any one, for instance, of our splendid ocean steamers, her breadth of beam does not much exceed one-tenth of her length, and of course, therefore, her draught is so great that Sandy Hook scarce gives water enough to float her without watching for the tide.

Now, is this necessary? Are we bound to go on in the same way, or is it one of the nursery legends which have come down to us by inheritance, and with which, when we learn to go it alone, we can dispense? The two plans of boats to which reference has been made turn our attention toward this matter.

The first one was evidently intended only as a pleasure boat, and to be of small size, but it was original in its design. It was to have the general proportions of a catfish, that is, the bullhead of Connecticut, or bull-pout of Massachusetts, the *Amiurus nebulosus*. This brings the bow broad and flat, the breadth carried very well forward, and gently rounded up only, while aft it tapers to a narrow waist and wedge like stern, with nothing there to make her drag water in the least. The greatest breadth, away out, quite near the bow, will be about one-fifth the length of keel. What this peculiar build will do remains to be seen. It is certainly unlike any ordinary model, and it is much to be hoped that its results, whether satisfactory or not, may be made public. The trials which fail are of perhaps the most interest and advantage to everyone except the originator.

In the second case there was not absolutely anything new. It was a small steamer constructed for a sugar estate on the Magdalena river, and to secure a sufficiently light draught her beam was about one-fourth of her length, with full bearings carried well fore and aft, yet without a really flat bottom, fine lines being her general characteristic. With a length of 54 feet her extreme draught is to be only two feet.

No one can stand well forward and watch an ordinary steamship as she is plunging into a heavy head sea, without being conscious of the terrible strain which comes upon her, as she berries herself in the next sea before she begins to rise. Her sharp bow cuts into it like a knife, and away she goes down, down, before her displacement is able to overbalance her weight and downward pludge, and then she lifts and goes over. If now, instead of this knife edge she had the breadth forward which would have rendered impossible any such depth of submersion, whose amount of displacement would have sent her over the coming sea, when instead of plunging thirty feet down into it she had hardly buried herself a fathom, what laws of hydrodynamics will show that in the latter case a decidedly important part of the strain upon her timbers would not have been avoided. *Scientific American.*

DEVICE FOR DISCHARGING WATER FROM SHIPS.—A successful trial was made a few days since, in New York harbor, for discharging water from ships without pumping. The invention consists of a valved tube which passes through the hull of the vessel, at or about midships. The tube is arranged to be pushed down outside of the hull when in use, and withdrawn even with hull when not in use. The tube carries a valve, by opening which communication between the inside of the hull and the water outside may be established. The extremity of the tube, looking toward the stern of the vessel, has an orifice, but the front portion of the tube is solid. When the tube is pushed down through the ship's bottom, the forward motion of the vessel will produce a suction in the tube, and if the valve is opened the water in the hull will be drawn out.

The inventor expects that sailing and steam vessels may be kept dry and prevented from sinking by simply adjusting the tube and valve as above indicated. On the recent trial here the valve was applied to an old scow sixty feet long, towed by a tug. The valve was opened and water was allowed to flow in and fill the scow until it was almost ready to sink; the tug was then started, and under a speed of three miles an hour the scow was in ten minutes relieved of its water in the manner described.

A NEW ROAD TO THE SEA.—The practicability of a through line of rail from Minneapolis to the eastern seaboard via the Sault Ste. Marie, has been discussed for years, and the feeling has been general among railroad men and others competent to judge of the cost of such a line, and aware of the immense traffic awaiting it, that it would sooner or later be constructed. At last the project has taken definite shape and articles of incorporation of the Minneapolis, Sault Ste. Marie & Atlantic railway have been filed in Madison under the laws of Wisconsin. The capital stock has been fixed at $12,000,000, and of this amount a large portion has been subscribed for by the board of directors, which includes some of the largest business men and capitalists of the northwest.

USEFUL INFORMATION.

Steaming and Bending Wood.

The process of forming the crook or curl for walking-canes which are not naturally supplied with a knob or hook, is thus described: The workman places one end of the cane firmly in a vise, and pours a continuous stream of fire from a gas-pipe on the part which is to be bent. When sufficient heat has been applied, the cane is pulled slowly and gradually round until the hook is completely formed, and then secured with a string. An additional application of heat serves to bake and permanently fix the curl. The under part of the handle is frequently charred by the action of the gas, and this rubbed down with sandpaper until the requisite degree of smoothness is attained.

In an address recently delivered by Mr. H. G. Shepard, of New Haven, Conn., relative to the use of wood in carriage making, he said that after a piece of wood is bent its characteristics undergo a considerable change. The wood is heavier, and its fibers have become interlaced. It will sustain more pressure and strain than straight wood in the same directions, either across or with the grain. He said: A piece of timber that has been steamed, whether it is bent or not, has its stiffness increased. It is more brittle than it was before, and for some uses it will do as well, and yet there is a quality that the steaming process and the kiln-drying process affect very much the same; they both cook the gum in the timber and make it brittle and stiff. There is a grade or class of hickory that is benefited by being steamed or kiln-dried for use as spokes or whiffletrees. There is a kind of hickory that never becomes stiff by natural process of drying, and one of the desirable qualities of a spoke, rim, or whiffletree is stiffness, as well as strength. You take that hickory—and it is the very best we have—and steam it, and it is better fitted for these purposes than it was before. It is difficult to tear apart a piece of bent wood; the fibers are interwoven one with the other. We do not perceive the change on the outside, but when we come to split the stick open, we find that its character is entirely changed.

PRESERVING TIMBER.—According to experiments made upon the Hanover, Cologne and Minden railway, fir sleepers injected with chloride of zinc required a renewal of twenty-one per cent in eleven years; birch sleepers injected with creosote required a renewal of forty-six per cent at the end of twenty-two years; oak sleepers injected with chloride of zinc required a renewal of about twenty-one per cent at the end of seventeen years; while the same kind of sleepers in their natural state require a renewal of at least forty-nine per cent at the end of a like period. The conditions in each of these cases were very favorable for obtaining trustworthy proofs. The subsoil of the line was good; the non-renewed sleepers showed, when cut, that they were in a sufficiently good state of preservation. Upon another line, where the oak sleepers were not injected, it was necessary to renew them in the proportion of seventy-four per cent at the end of twelve years; these same sleepers, injected with chloride of zinc, required a renewal of only 3.29 per cent at the end of seven years, whilst those injected with creosote required a renewal of only 0.09 per cent at the end of six years.

OLD SHOE LEATHER.—You probably think, if you look very sharply at an old shoe when you throw it away, you will know it again if it ever comes back to you. But that doesn't at all follow. One of these days you may button your dress with an old pair of slippers you once owned, comb your hair with a boot, or grasp a cast-off gaiter while at your dinner. This is not romance, for old shoes are turned to account by manufacturers in the following manner: They are cut into very small pieces, and kept for a couple of days in chloride of sulphur. The effect of this is to make the leather hard and brittle. Next the material is withdrawn from the action of the chloride of sulphur, washed with water and dried. When thoroughly dry it is ground to powder, and mixed with some substance like glue or gum, that causes it to adhere together. It is then pressed into molds and shaped into buttons, combs, knife-handles, etc.

LUMINOUS PAINT.—White luminous paint has been known for some years, and chiefly used for watch dials, match boxes and other small objects, but all attempts to produce luminous paints of various colors have hitherto failed, owing to the fact that the sulphate of calcium, the principal constituent of luminous paint, is decomposed by the metals contained in the usual colors, whereby not only the luminosity, but also the color is destroyed. Lately, however, G. Schatte, of Dresden, has succeeded in producing red, blue, green, and otherwise colored paints, which have the quality of shining in the dark with the same color which they possess in the daylight. It is easy to see that a variety of artistic effects may be produced by means of such colors.

A PERPETUAL CLOCK was started at Brussels a little over a year ago. An up-draft is obtained in a tube or shaft by exposing it to the sun; this draft turns a fan, which winds up the weight of the clock until it reaches the top, when it actuates a brake that stops the fan, but leaves it free to start again after the weight has gone down a little. At the last of June the clock was running perfectly, after having been in motion for nine consecutive months.

MAHOGANY SPURS.—A writer who has made a study of the mahogany tree, says: A peculiarity of the mahogany tree, of which very few have knowledge, is seen in the numerous spurs, which are thrown out from the body of the tree at regular intervals from the ground up the tree to the height of twelve feet or more, all of which grow downward like roots, and finally enter the earth and become real roots. These spurs, often from twelve to sixteen inches in diameter, are incomparably superior to any part of the trunk for beauty of texture and color. These spurs are rarely cut by the loggers, on account of the great labor necessary, to avoid which the axemen built a hasty scaffolding of sufficient height to enable them to cut off the tree above the spurs. So highly are these secondary roots valued for their beauty of grain and color, that of late years dealers are having them cut for the market as an extraordinary prize. Some of these mahogany spurs have been sold for $250 per 1,000 feet board measure, while the body of the tree brought but $40 at the port of exportation.

A NEW INVISIBLE INK has been introduced by Dr. Widemann. It is made by intimately mixing linseed oil one part, water of ammonia 20 parts and water 100 parts. The mixture must be agitated each time the pen is dipped into it, as a little of the oil may separate and float on the surface, from which if taken up by the pen a stain would be left upon the paper. To make the writing appear, all that is needed is to dip the manuscript in water; when the paper dries the writing will vanish.

A BRILLIANT black can be produced, it is said, on iron and steel, by applying, with a fine hair brush, a mixture of turpentine and sulphur, boiled together. When the turpentine evaporates, there remains on the metal a thin layer of sulphur, which unites closely with the iron when heated for a time over a spirit or gas flame.

A SPECIES of spider has been discovered on the African coast, the long firm web of which very closely resembles yellow silk. It is said to be nearly as good as the product of silkworms. The filaments have been examined by Lyons silk merchants with favorable results. There seems to be nothing to prevent the acclimatizing of the insect in France.

COLORING DIAMONDS.—It appears that if common yellow African diamonds are immersed for a few minutes in an aqueous solution of aniline violet, they acquire a fine steel blue tint peculiar to the best stones.

GOOD HEALTH.

Sea Bathing.

At the present time, says the *British Medical Journal*, it may be useful to recall the chief general indications and contra-indications which respectively sanction and forbid bathing in the sea. "Shall I bathe?" This is a question which thousands of health seekers will be asking of their doctors during the next few weeks. While the stimulus of a fresher air, of change of scene, and of new occupations, together with rest from accustomed work, are the elements from which the weakly, the worn, the worried reap physical and mental restoration in a sojourn on the sea coast, it is unquestionable that bathing in the open sea is, in itself, a powerful restorative agency, which many persons may employ with very great advantage.

The universal experience of our race, through unnumbered ages, has shown the value of sea bathing in both preventive and curative medicine. A good rule, laid down by an experienced physician, is this: In all cases showing impaired functional powers, without any manifestation of inflammatory symptoms, in short, in those cases in which the exhibition of alteratives and tonics is indicated, sea bathing may, with proper precautions, be resorted to; it is contra-indicated in persons of plethoric habit of body, in cerebral congestion, in organic disease of the heart, in aneurism, and in all persons who have the imiability safely to encounter a comparatively severe shock; while it is also to be forbidden at certain periods in which the female constitution is not prepared for the application of powerful remedies. Because it tends, in certain conditions of impaired health, to cause determination of blood to the viscera. Bathing in the open sea is generally unsuitable for persons disposed to congestive disorders of the lungs, kidneys, liver, and brain.

It is hurtful to bathe babies in the sea; children under two years of age are too young to bear with advantage the comparatively severe shock of a cold sea bath. In old age, when the bodily powers are unequal to a vigorous reaction, sea bathing may do much harm, especially in the subjects of extreme arterial degeneration. In suitable cases, and under proper precautions as to time of bathing and duration of exposure, a daily bath in the open sea is a valuable restorative. In individuals who are fairly robust, it is a stimulant, alterative, and tonic, promoting appetite, tissue change, and excretions, and bracing up the nervous, vascular, and muscular systems. Sea bathing is especially useful as a powerful and unsurpassed tonic in delayed convalescence from acute diseases, in many chronic affections, and in persons whose strength has become enfeebled by injurious excesses, by mental strain, or by unhealthy occupations.

Take Care of the Children.

Much may be done to prevent the croup by the exercise of good judgment in the care of children. Some parents make their children very sensitive and delicate by excessive prudence. A child kept in the house and treated like a house-plant can hardly be prevented from encountering a rude blast of wintry weather by the oversight of some one having the care of it. It is better to toughen the child by clothing it warmly and giving it a good airing every day, either in walking or riding. The mistake should not be made of putting fur or woolen about the throat. Toughen the throat as you do the face. Be sure that the extremities are as warmly clad as the trunk of the body. See to it that the shoes are made to exclude snow water, and still avoid the use of rubbers, unless, if necessary, a pair of low sandals be used to protect the soles of the feet. One more hint to overprudent mothers: Do not cover the child too warmly when put to bed. Nothing is more liable to give a child a cold than to be muffled in too many blankets or spreads of some kind, for as soon as it gets into an uncomfortable perspiration it will free itself from the cumbrous covering, and then by a sudden checking of the perspiration, contract a cold. There is absolutely more danger from excessive than too little covering.—*Dr. Foote's Health Monthly.*

POISON IN FLOUR.—A mysterious illness has been disturbing a small community in France. One member after another sank, while presenting the usual appearance of lead poisoning, without any apparent cause. The doctors who were called in could not make much of the symptoms, except that they seemed to proceed from some food which had been taken. By a process of inductive reasoning, and by exhausting the causes which were found to have operated upon all the sufferers, suspicion at last fell upon the bread. An examination was accordingly held at the bakers' premises, but they, having been found blameless, the inquisitors next proceeded to attack the miller, and here, at last a diligent inquiry brought to light the cause of all the mischief. Finding that his millstones had cracked in some places, and that the purchase of new stones would be somewhat costly, the miller had adopted the plan of filling the chinks with melted lead. The lead had, in the course of grinding, naturally got mixed with the flour, and had so found its way at last into the loaves distributed to the population. The tale is interesting as showing the pertinacity of particles of lead in clinging to any substance with which they may get mixed. It is still more noteworthy than the case of lead poisoning which occurred in Paris not long ago, when it was found that a baker had warmed his oven with old wooden boards that had been painted with white lead, and that the residue of the lead lying in the oven had penetrated into the crusts of loaves.—*The Continental Gazette.*

THE FATAL CRAMP.—A writer in the *British Medical Journal* calls attention to the frequent notices of death, by cramps, of bathers, and suggests some preventives—remedies are in these cases too late. He says that cramp is a painful and tonic muscular spasm. It may occur in any part of the body, but it is especially apt to occur in the lower extremities, and, in its milder forms, it is limited to a single muscle. Pain is severe, and the contracted muscles are hard and exquisitely tender. In a few minutes the spasm and pain cease, leaving a local sensation of fatigue and soreness. When cramp affects only one extremity, no swimmer or bather, endowed with average presence of mind, need drown; but when cramp seizes the whole of the voluntary muscular system, as it probably does in the worst cases, nothing, in the absence of prompt and efficient extraneous assistance, can save the individual from drowning. Its most powerful and most avoidable cause is the sudden immersion of the body, when its surface is highly heated, in water of a relatively low temperature.

CATCHING COLD.—How can a man "catch cold" in a Pullman in July? Simplest thing in the world. Sit still most of the time for a week, and eat "as much as you want" every five or six hours. Don't restrict yourself to simple food, as fruits, with a little coarse bread, for example. When the feeding stations are reached don't devote the half hour to walking up and down the platform, swinging the arms well so as to exercise the body all over, encouraging the excretory system to keep the body clean, but join the crowd in their rush for an excessive quantity of hot fried stuff, wheat starch bread, "pie," and hot slops. Eat till the bell rings for "all aboard," then rush back into the unventilated car and sink down in a corner, doubled up in a heap, and sleep off your surfeit. You are pretty certain to "catch" something by the time you land in New York. Why not call it "a cold?" Sure enough!

FOR poison ivy, bathe the parts in a decoction of hemlock boughs, or of oak leaves, or with a teaspoonful of copperas (sulphate of iron) in a small teacupful of boiling water; or rub wet salt on the affected parts. If the blisters are broken, one application of niter will be sufficient.

Passing Events.

There is uot much of interest to report from the mining regions of the coast aside from what we have noted in our "Mining Summary." Winter will soon be with us, and the prospectors will shortly begin to come into winter quarters. There have been no very remarkahle strikes this season, though, of course, very many new locations have been made. It is probable that next summer will see more prospectors in our northwestern regiou thau ever before.

The northern States of Mexico are coming more and more into notice as mining fields, aud the gradual increase of tbe American element in the region is awakeuing it so that better progress will be made.

As details come to hand of tbe great earthquake which has altered the straits of Sunda for navigable water to shoals, it is seen that this is the great world-change of modern times. Thousands of people have been killed and the whole face of the country altered.

AMERICAN NEWSPAPERS.—According to the "American Newspaper Catalogue" of Edwin Alden & Bro., Ciucinnati, Ohio, just published, containing over 800 pages, the total number of newspapers aud magazines published in the United States and Cauada is 13,186, showing au inerease over last year of 1,028. Total in the United States, 12,179; Canadas 1,007. Published as follows: Dailies, 1,227; Tri-Weeklies, 71; Semi-Weeklies, 151; Weeklies, 9,955; Bi-Weeklies, 23, Semi-Monthlies, 237; Monthlies, 1,324; Bi-Monthlies, 12.

San Bernardino County Minerals.

Although San Bernardino has long heen known as a mining county, no very extensive operations were carried on there until within the past few years. Some minerals are found there which are produced nowhere else on the coast. In the future this county will appear to better advantage in summing up all that relates to miuing. At the State Mining Bureau, the two cases devoted to the county contain enough to convince the most skeptical, that for variety of uineral products and richness of ores, San Bernardino takes high rank.

In the collection referred to are several specimens of tin ore from the Temescal tin mine and San Jacinto mine, donated by L. Franconi and the Temescal Tin Co. This is the only tin fonnd anywhere in the United States in any quantity. There is also a collection of ores from the King mine, Calico district.

There is a magnificent specimen of ore from the Copper World mine, Clark mining district, eighty miles from Daggett. Specimens of magnetite, also of pyrolusite and rhodonite from near Colton. McIntosh & Co., silver ore from Wm. Utter; sulpbate of baryta from Calico district, Sol. Heydenfeldt, Jr.; selenite, from Calico, John Daggett. The coal exhibited was brought by Mr. J. R. Scupham, from Cajon pass; it contains (by analysis) water 9.67, volatile hydro-carbon, 27.67, fixed carbon 46.53, ash 16.13. A piece of chalcedouy from Soledad canyon is exhibited hy Henry Sherwood. Crystallized gypsum from near Calico district; white dolomite from Amargosa wash, J. H. Colerich; satin spar from H. G. Maynard, fossils occurring with the coal mentioned above; lepidolite from twenty miles southwest of Colton, G. Kerstel; silver ore, San Francisco mine; silver ore, Resting Springs, Wm. Masher; mica schist, Ivawatt district, W. S. Keys; silver ore, Leach mine, Ord district; azurite, New York district, Hugh McCormick.

One of the unique specimens is a large borax crystal, probably the finest crystal that has ever heen fouud in the State. It differs from those found at Borax lake, Lake county, in being free from the inclosed mud which renders them opaque. Mr. E. M. Skillings donated this specimen. Tincal, State range, H. G. Hanks. Letharge from W. D. Brown. Crude material from the borax deposits. Selenite from Calico district, S. Heydenfeldt, Jr. Mineral water from the "Anti-fat Spring," W. T. Garratt.

There is a fine collection of copper ores from Clark's mountain, donated by E. Clark, of Calico. Galena, donated by Jno. Skinker. Silver ore, Resting Springs, W. G. Lent. Asphaltum pierced by shells, a very curious specimen, H. G. Hanks. The nitrate of soda from the cave in Calico district was given by W. B. Murdock. Not known to exist in auy large quantity.

There is a large collection of ores from the different levels of the Belle McGillivray mine, Providence mountain, Thomas Ewen. Rich gold rock, Pinacate district, twenty-four miles south of Calico, J. R. Scupham; silver copper ore six miles from Lane's Crossing, Wm. H. Moore; silver ore, Great Eastern mine, W. S. Keyes; silver ore, San Francisco, Ivawatt district, W. S. Keyes; silver ore, very rich, showing cerargyrite, Queen mine, Calico, John Daggitt; ore from Gold Mountain miue, W. H. Watson; silver ore, Oriental mine, Calico mountain, James Walsh; silver ore, Occidental mine, Calico, S. Heydenfeldt, Jr.; silver ore (embolite), Grapevine district, H. G. Maynard; silver ore, Occidental mine, Calico, Chas. M. Tyler; silver ore, King mine, Calico, C. M. Tyler; silver ore, Golconda mine, Calico, Mrs. Townsend; silver ore, Silver King district, Calico mountain, H. G. Maynard; silver ore, Burning Moscow mine, Calico mountain, Chas. M. Tyler; free silver in gangue of barite, Waterman aud Porter mine, Grapevine district, J. S. Waterman; silver ore, Geneva mine, C. M. Tyler; silver ore (with native silver in calc spar and barite), San Gabriel mine, C. M. Tyler; silver ore, Veto mine, Calico, Chas. Kaufman; embolite, Plntarch mine, Calico district, John Daggett; rich silver ore coated with emholite, Garfield mine, Calico district, John Daggett.

NEXT to iron, copper is the most useful metal in the world. In its general distribution, it comes next to that most important of all metals. The qualities of durability, malleability, ductility, etc., it possesses, render it adapted to a great variety of purposes.

Life Brigades for Mining Districts.

We have before spoken of the project of providing life hrigades for mining districts, so that in case of accidents underground all the necessary appliances would he at hand ready for immediate use. The idea origiuated among the English coal fields. There are several forms of apparatus by means of which men may enter deadly and explosive atmospheres. Colliery fire pumps are constructed to run in any gauge of railway underground, and are readily adjusted. Steam fire engines to get up steam in a few minutes are not very expensive. Mr. Alar Bagot, a mining engineer who has given much attention to the welfare of miners, says the estimated expense for equipping a brigade in each district is £800, and an annual outlay of £100 for maiutenance in renewals. A station thus equipped would protect an area of thirty miles around it. The men would be drawn from tbe mine where the accident occured, only two men coming with the trucks containing the apparatus, very much as the breakdown gangs are collected on the railway. Tbus local and intimate knowledge of the workings of the mine, with a knowledge of the nse of the apparatus, are secured. The certificated managers of the various collieries in the district should be taught the nse of the appliances, and any others of the engineering staff, such as mechanical engineers, deputies and firemen; each proficient man should be supplied with a distinctive badge, and every colliery should be supplied witb a list of the brigade. Each colliery should be visited in turu by the meu in charge of the appliances, and the miners should be drilled periodically by a committee of the mining engineers of the district.

Against the cost of annual maintenance a small sum might be written off by rates for local fire brigade service. It will be observed that, as in the case of the lifeboat service, everything depends npon the courage of those who have to use the appliances; hut, as we have had instances where the exploring parties have beeu suffocated sooner than give up the attempt to save the snrvivers, we can have very little apprehension how they would behave were they equipped with appliances to enable them to carry out their object with comparative safety. What owners of colliery properties should bear in mind is, that if the workings of a mine are filled with choke-damp, entrance, except hy the aid of aerophores, is impossible, and that it is not right that such appliances should not be available in mining districts. Further, that accident is as costly to the owner of a mine as to the lessees, and that the system of life brigades proposed here is an alternative and less expensive scheme than that of each mine having its own appliances.

New Amalgamator.

A new form of amalgamator has lately been invented which has some curious features. A hopper is secured to a frame, and adapted to receive earth, pulp or sand. Attached to the lower part of the hopper is a suitable tube or chamber, in which a screw is made to revolve by any suitahle power which is applied to the outer end of the shaft. The shaft is journaled in the frame and the end of the tube. The screw serves to feed the earth or reduced ore from the hopper directly into a tube.

This tube is made of a number of separate and distinct sections, each one of which is made so as to have an abrupt shoulder formed at its largest point. This shoulder serves to hold mercury, which is to be placed in each section, so as to catch the precious metal from the earth or sand passing through the tube as it is caused to revolve with the screw. In each section is also placed an amalgamated plate. The tube is placed at a suitahle incline, so that the earth or pulp will flow constantly through without clogging.

This machine, the inventiou of C. E. Topping, of Socorro, N. M., is intended to be used eitber with dry earth or quartz, though water may be used. With water, the mud in parts, in flowing through, will allow the heavier portions to settle into the mercury and form amalgam more quickly than by the dry way. The incline of the tube and its revolving motion dispense with the necessity of a head of water to force the pulp through. In cleaning np, each section can be removed separately and the mercury and plates removed.

Magnetic Ore Separator.

Some time since we described a maguetic ore separator invented by Thomas A. Edison, who has since, however, hit upon another plan for separating magnetic from non-magnetic substances. The new plan has the same object, but is intended to be nsed with sluices. The dirt, sand, etc., with the water, enters the upper end of the inclined trough or sluice, beneath which are placed magnets. The trough may be of any desired material; if of magnetic material—as iron—it forms polar extensions of the magnets; while if it be of nonmagnetic material, the magnets act therethrough sufficiently to accomplish the desired result.

The horseshoe magnets are preferably electro-magnets energized through conductors from any suitable source of electricity. They are arranged in series or placed in multiple-arc or derived circuits.

The pulp, earth or sand passes down the sluice, and when it comes within the influence of the magnet, the magnetic substances are attracted and a portion of them are held to the hottom of the sluice, while the rest passes on to the next magnet. A suitable number may be employed to separate all the magnetic substances.

Permanent maguets instead of electro-magnets may be used, though the latter are best. The construction involves the greatest simplicity, aud permits the charge of any ordinary sluice-box into a magnetic separator without any cutting or fitting. Both the sluice-box and magnets being stationary, the iron particles are held in place and act as riffles to retard the gold. The sand, etc., flows on to the end of the sluice. The gold and magnetic substances can then be collected and separated. The peculiar method of forming riffles by tbe maguets collecting the iron sands, form one of the important features of Mr. Edison's patent.

Mine Ventilation.

In Great Britain they have very stringent rules on the subject of ventilation in colheries, so that mine owners and managers shall not by carelessness or parsimony be the cause of accident. When accidents do occur, the certificated managers are overbauled and the blame placed where it belongs; aud moreover, the culprit is punished. The Miner Regulation Act is on these points quite strict. The first rule provides that "an adequate amount of ventilation shall he constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts shall be in a fit state for working and passing therein." The second rule provides that "in every mine in which inflammable gas has been found within the preceding twelve months, then once in every 24 hours if one shift of workmen is employed, and once in every 12 hours if two shifts are employed during any 24 honrs, a competent person or persons appointed for the purpose shall, before the time of commencing work in any part of the mine, inspect with a safety-lamp that part of the mine, and the roadways leading thereto, and shall make a true report of the condition of the ventilation; and no workman shall go to work in such part until the same, and the roadways leading thereto, are stated to be safe. Every such report shall be recorded, without delay, in a book which shall be kept at the mine for the purpose, and shall he signed by the person making the same;" and the fifth rule states that "a station or stations shall he appointed at the entrance to the mine, or to different parts of the mine, as the case may require, and a workman shall not pass beyond any such station, until the mine or part of the mine beyond the station has been reported safe."

It will be seen that the Government does what it can to protect the lives of the working miners. It is not, of course, necessary to be so stringent in such mines as give off no inflammable gases, yet even in these proper supervision is required and enforced.

THE *Jekaterinoslav Nedelja* announces the discovery lately in the Uspenskij portion of the Ural range of some very rich auriferous deposits. On the first day twenty-two nuggets were found, four of which together weighed more than five Russian pounds. The remarkable feature in this discovery is not the quantity of gold forthcoming, but the singular form of the crystallization. Thus, one of the nuggets had among its gold crystals a pyramidal octahedron about one-fourth inch in size.

Animal Life In Mining Shafts.

Mr. S. P. Parks, Superintendent of a mine in Amador county, has sent down to the California Academy of Sciences a number of specimens of subterranean spiders. One vial contained small spiders; one containing a larger spider taken from a station where a dim lamp burns; one vial containing small gnats or wood lice, and a little brown worm. In the same vial were pieces of bark. There were also some pieces of wood from the timbers where these insects live, and pieces of the rock from the same places, all wrapped in paper in the mine when taken. The wood is covered with mold on the outside. The timbers are everywhere moldy. In some places the mold is evenly distributed on the timber, and from one to two inches thick. In others it hangs from the timbers like fringe and in long strips. In some places it is shaped like moss and toadstools. Webs are found in the shafts from the surface down (everywhere that there is not too much moisture) among timbers in all stages of decay; so are wood lice or gnats; but the worms only inhabit very rotten timber where there is some moisture.

As the adaptation of organic life to new surroundings, and the different methods in which this adaptation is accomplished, are of the highest interest to the biologist, and exhibit many points from which analogous of a more general character may be drawn, Dr. Herman Behr presented to the Academy a catalogue of the organisms received and mentioned above. He was assisted by W. G. W. Harford on the subject of mollusca, Dr. Eisen for the arachnides, and Dr. Harkness for the fungi.

The spiders were all of the same species, though of different sizes. The genus is related to the old genus *Theridon*, but is classified by the Swedish scientist Thorill, with a new genus. The same scientist has described the species which is peculiar to the American west coast. It weaves its nests in the crevices of the bark of trees, and has been found by Dr. Eisen in many localities of this coast, as far even as Guatemala, in Central America. The specimens came down alone from the mine. The exact name could not be given by Dr. Behr, because the Academy does not possess Thorill's works.

The worm which came from the shaft is a species of *Lethobius*, a genus related to the *Scolopendra* (centipede). It is found under the bark of trees.

The wood lice and gnats which were sent must escaped. Several pieces of wood were perforated in galleries, evidently the work of wood-feeding insect larvæ.

Besides the animals mentioned, were found the spider webs, five specimens of the common fly, and several specimens of a tiny snail, identified by W. Harford as *Hyalina arboriola*, a species found in the trees, as the name implies. Of fungoid growths, there were several kinds, only one of which was identified. Dr. Behr said:

It is more difficult to account for the presence of the house fly, and the the only explanation I can offer is that the specimens have been swept down by a current of air so strong that they could not resist. I am told that light objects at the entrance of shafts sometimes disapper rapidly, as if swallowed up by a kind of suction. How far into the depth such a current reaches I am unable to ascertain. At any rate, it is difficult to believe that winged insects like the house fly could propagate in such localities and raise new generations.

The animals introduced with the timber are either endowed with the faculty of adapting themselves to the new circumstances of an abode of eternal darkness or they are not.

It is next to certain that the origination of the Hyalina possesses all the conditions necessary to adapt itself for a subterranean existence. The animal under ordinary circumstances, seeks darkness and moisture, and is speedily killed when exposed for a certain time to the direct action of a powerful sun. It is a vegetarian, and finds plenty of nourishment on the fungoid growths, perhaps even on the wood itself.

Probably after a series of generations in darkness the eyes of the species will have disappeared entirely, as is the case with other animals digging underground or living in caves or in great depths of the ocean, inaccessible to light. Nature is economical and does not reproduce organs when there is no more use for them. As to the spiders, it is probable that they may continue through generations in their new abode, and even establish themselves permanently. They are exclusively carnivorous. They are not dependent entirely on the house-flies that are blown down the abyss, but probably not in all seasons. There is probably more animal life around them than the specimens at present demonstrate, or else a continued existence of the spider would be rather doubtful if it had to depend on such precarious supplies.

If they really continue to exist in their present abode they will lose their eyes, and will then exhibit the curious feature of an eyeless animal in a group that is classified by the number and position of the eyes.

The *Lithobius* is carnivorous like the spider, and has about the same chances to form a subterranean colony.

If the insects mentioned in the letter but not contained in the vial, are species of the winged insects, it is very improbable that they will form a permanent colony. The larva of many *tipulides* or of the *Psorus* have the light and are well adapted for subterranean existence, but a winged image living in absolute darkness has not yet been observed, and if at all, a permanent colonization of these species should establish itself, a great change in the organization of these animals must take place.

At any rate, we have in such shafts all the conditions necessary to support a little subterranean world of its own. We have rock and wood to support the fungus, wood and fungus to support the vegetation, and the vegetation to support the carnivorous.

THE Russian Minister of Marine has raised the question of employing petroleum fuel in the ships of the Black sea fleet, this material being considered cheaper than coal.

THE total annual reduction on the revenue on tobacco, snuff and cigars is now computed at $36,000,000.

Bromide of Sodium in Amalgamation.

A new method of amalgamation has been invented, the object of which is to assist the separation of gold from its ores by the use of bromide of sodium in the process of amalgamation. The ore is pulverized, roasted to remove sulphur, and finally chloridized in a suitable manner. The ore is then placed in amalgamating pans and mixed with bromide of sodium in the proportion of two pounds of bromide to a ton of the ore. To this is then added a sufficiency of water and of quicksilver to produce a proper amalgamation of the metal.

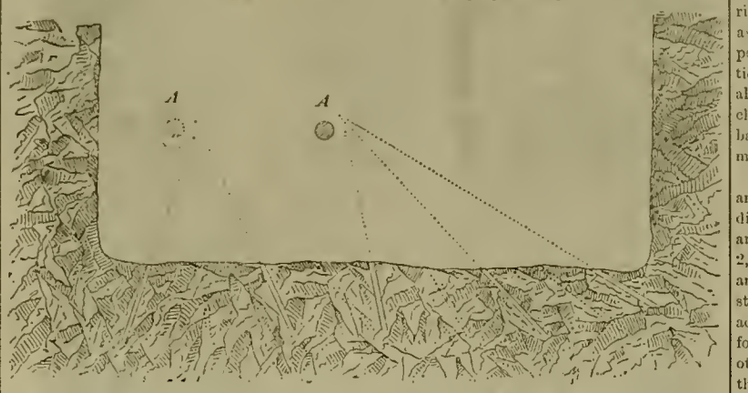

FIG. 1. POSITION OF CLAMP IN RADIAL SYSTEM OF BLASTING.

After the amalgamator has run about three hours the pulp is discharged through separators. By adding the bromide of sodium the sulphate and chloride are kept from attacking the mercury.

The inventor, W. E. Harris, of New York, is of course aware of the common use of cyanides of potassium, salt and sulphate of copper. The claim of the patent is as follows: "In attaining precious metals from ores by amalgamation, the process of protecting the mercury from the action of sulphate and chlorides, which consists in adding bromide of sodium to the ore in about the proportions stated, and then mixing the same with mercury and water."

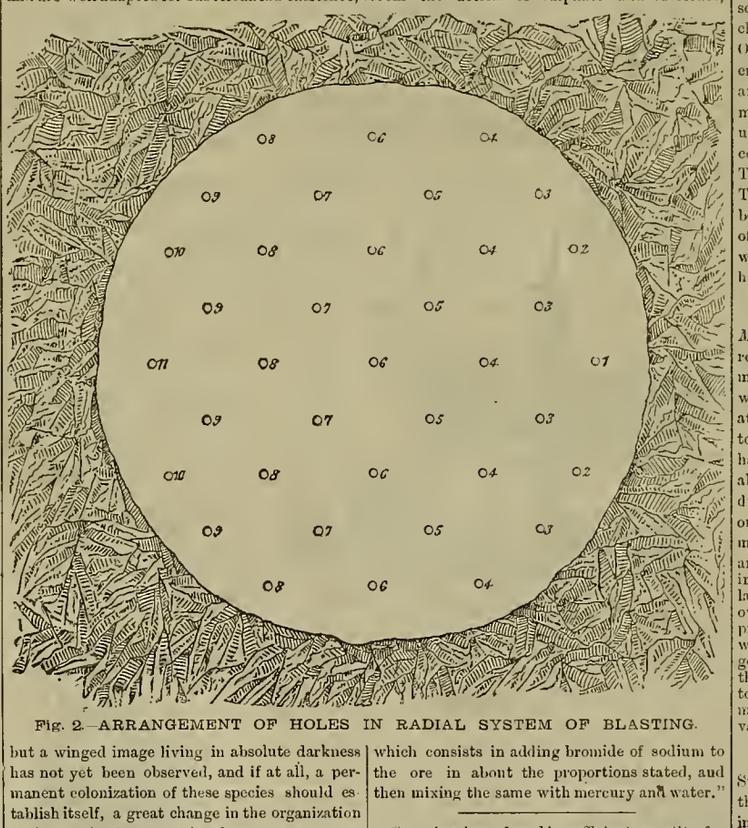

FIG. 2.—ARRANGEMENT OF HOLES IN RADIAL SYSTEM OF BLASTING.

GOLD has been found in sufficient quantity for exploration in twenty-three counties in the State of North Carolina, and occurs both in veins and gravel deposits extending over a wide area. At one time the yield of gold from North Carolina was very great, and afforded employment to a large number of hands, but the gold discoveries in this State diverted attention from North Carolina, and the subsequent disastrous civil war practically crippled all enterprise, and beggared what had previously been one of the wealthiest populations in the Union. From so rude a shock the recovery has naturally been both slow and tedious, but at length public attention is being again directed to the dormant wealth of the country.

Blasting in Mines—No. 7.

We have once before alluded to the "radial system" of drilling. This is a method of using the machine drill introduced by Mr. W. B. Brain, in which it is sought to fulfill the two sets of conditions, namely: those due to the exigencies of machine labor, and those involved in the attainment of the greatest useful effect from a given charge in the fullest possible degree. This method constitutes a system of both applying the drill and of placing the charges, and the success attending its adoption was marked. In this system the holes of each series, 1, 2, 3, 4, 5 (Fig. 2), or as many of them as possible, are made to radiate from some fixed point (Fig. 1), which point represents the position of the clamp on the stretcher bar. When all the holes in one series have been bored, the clamp is shifted a certain distance along the bar and the next series is bored in the same manner.

The distance apart of the holes of a series, and also of the series themselves, that is, in the distance between the series 1, 2, 3, and 1, 2,3, and also between the series 1, 1, 1, etc., and 2, 2, 2, etc., is determined beforehand, in accordance with the toughness of the rock and the strength of the explosive, and afterwards strictly adhered to, irrespective of joints, fissures due to former blasts, irregularities of the face, or any other circumstances that may exist peculiar to the case. The angles of the holes in a series, 1, 2, 3, etc., are also preserved through all of these series, so that all the holes in a series, 1, 1, 1, etc., are in the same place.

It will be observed that in this system the unkeying of the rock takes place from the side of the face by sharply angling the holes in that position, and that as many of the holes as possible are bored from one position of the stretcher bar. In general, unless the diameter of the excavation is very great, one change of position from *A* to *A'* will be sufficient. Thus it is evident that these charges have been reduced to the lowest limit in this system, and that, consequently, the loss of time due to the labor of charging has been brought to a maximum value. On the other hand, a certain loss of time is incurred in setting the machine to the required angle at each successive boring. It must be remarked that this system was designed for simultaneous firing with high explosives, and these conditions must be fulfilled to insure success. The cuts we take from "Andre's Coal Mining." The blasting, especially if the shot holes have been bored by machine drills, leaves the sides of the excavation in a very rough state. These will, therefore, require to be dressed down by hand with pick and wedge.

TO PROSPECTORS.—The Rocky Mountain *Mining Review* very truthfully as well as timely remarks, that there is very little money to be made in locating and doing the assessment work upon prospects with the view of selling at once. In the first place it is very difficult to sell an ordinary prospect—men with money have been bitten so often that they hesitate about taking a good thing and cannot be induced to touch an ordinary claim. In the second place, if a customer is found, the price must be so low that there is little money in it, and especially so where a second party is taken in for the purpose of procuring a sale. And lastly, where the claim has a real value, the owner is cheating himself in letting it go at a prospect price. The time was when a claim with a ten-foot hole would sell readily at a good price, regardless of its showing. But that time was long ago and we are now down to hardpan. The time has come, when to make a sale, there must be something of real value to transfer.

METAL FARMING.—The people of the Eastern States, says the Los Angeles *Herald*, who think that mining in California, and elsewhere in the United States, is a very capricious and profitless business, and that the true way to wealth lies in building cotton mills, catching codfish and raising potatoes and tobacco, are reminded of the fact which has been made up by laborious statistics running through thirty years, in the United States, from 1850 to 1880, that a large list of mines reported, shows that while $700,000,000 have been expended on mines of gold, silver and lead, these mines have returned $2,200,000,000; being only 300 per cent profit in cash.

The sum of $150,000 out of the $372,625 paid in dividends this month by mining companies, was paid by copper mines—Copper Queen, of Arizona, and Osceola, of Michigan.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869, C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

WATCH HOLDER.—Walter H. Blow, Oakland, Alameda Co. No. 283,855. Dated August 28th, 1883. This is a device by which an open watch may be conveniently supported with its face in an upright position so as to be easily read whenever desired, and which device may also support a suitably sized watch-safe, photograph holder or jewel case. The back piece is made of wood, metal or any suitable material, slightly curved to receive the watch. A curved bent wire has its ends bent to one side so that they may be received in the face of the back piece. The watch slips in behind the curved wire which arches around in front of its upper periphery. The device may be hung or fixed permanently in any convenient position on a wall or on the head of a bed, or it may be shaped so as to rest on a table or stand with a supporting brace behind.

DUMP WAGON.—Geo. M. Wallace, Yuba City, Sutter Co., Cal. No. 283,937. Dated Aug. 28, 1883. This dump wagon has a peculiar hinged bottom, so the load is easily discharged. When in a horizontal position the boards lie close together and retain the load, but when thrown down on their edges in a vertical or inclined position they are so separated or opened that the load of dirt or other material will fall through. By decreasing the number of boards and measuring the width of spaces, rock may be dumped with as much facility as dirt. There are inclined ends or gates which give great capacity to the body, and also furnish a protection or cover for the oscillating shafts.

ROOF SCAFFOLDING.—Aaron R. Manley, San Jose, No. 283,968. Dated Aug. 28, 1883. This invention is a device which Mr. Manley calls roof scaffolding, and it consists of plates to which boards for a scaffolding may be fixed, and to one end of which is hinged an adjustable brace, while to the other end is hinged a bar or plate, which lies along the inclined roof, and has a gorge-bar fixed to it, this inclined bar and the brace serving to level the one which supports the staging, and adjust it to a roof of any pitch. The staging can be easily placed or moved from point to point with but little delay or loss of time, and no damage to the roof. It is firm and secure when in place.

BLACKBOARD RUBBER.—John Dooner, S. F. No. 283,870. Dated Aug. 28th, 1883. This is an improved rubber or eraser for blackboards. There is a main frame or body, and a secondary frame fitted within the main portion, and adapted to receive the erasing material around its periphery and below the main portion, which is combined with hooking devices by which the two frames may be secured together.

FLOUR BIN AND SIFTER.—Aaron R. Manley, San Jose. No. 283,969. Dated Aug. 28, 1883. The flour chamber holds one or more sacks of flour, which are emptied into it and covered up to keep out dust and insects. When flour is required, by turning a crank at the top a shaft and sieve are rotated, which causes the flour to pass through into a bin, or any suitable receptacle, being sifted on its way.

IN COLDS, CATARRH, HOARSENESS, HEADACHE, etc., use Brown's Iron Bitters.

INFORMATION is wanted at this office of one Joseph Craig formerly of Cass county Illinois who came to California in 1849.

Improved Quartz Mill Work.

Written for the PRESS by ALEX. H. EWART.

Knowing the interest your paper has always taken in the economical development of the mineral interest of the country, I have thought a description of a new quartz mill might prove interesting. This mill, after a successful run of over six months, has fully established the claim made by its builders, of great superiority over mills of its class. I refer to the mill of Total Wreck M. & M. Co., of Total Wreck, Pima county, Arizona.

The mill, constructed under the management of N. R. Vail, Esq., agent of the company (a New York incorporation), was erected under contract by Wm. H. Armstrong Hinckley, Spear & Co., of this city furnishing the machinery.

It is a twenty-stamp mill, driven by a Corliss engine, 20" diameter, 48" stroke; the main belt is run directly from the fly wheel which is 18 feet in diameter. The mill is furnished with rock breaker, twenty stamps, fourteen pans heated by exhaust steam, in addition to the clean-up pan and steam pump for returning the quicksilver to the pans.

The tramway that conveys the ore from the mine to the mill is sufficiently elevated to allow the ore bin to be placed above the rock-breaker, thus allowing all ore small enough for the battery to pass directly through the "grizzly," while all too large for that passes directly to the rock-breaker and is reduced for the stamps.

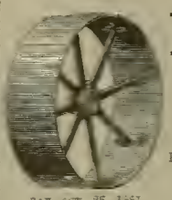
One great advantage of the continuous process to be spoken of hereafter is this, that from the time the ore is dumped from the car till it leaves the mill in the form of tailings, it requires no handling. Gravity, and a flow of water regulated to the requirement, takes the place of much handling and disagreeable work by the old process known as the tank process. The determination of the builder to reduce the amount of manual labor to the lowest point has been most successfully carried out, until it may be said, in fact, that nearly all the work is done by steam power, and the only labor required is in keeping the machinery in good order.

To demonstrate this, I will give some details of the labor employed and wood consumed, which taken in connection with the amount of ore worked, the high percentage obtained and thesm all loss of quicksilver per ton of ore milled, will effectually establish the claim of its builder, as also show the superiority of the continuous process of Mr. Boss, the inventor, whose patient labor and careful manipulation must have greatly aided Mr. Armstrong the superintendent as well as builder of the mill in bringing about the favorable results here recorded.

Careful trials were made for some weeks when the mill was first started by running half the stamps and half the pans under each style of working, and thus a comparative test of great value was obtained, the ore and tailings from each process being assayed daily, and the result showed a very decided gain in the percentage by the Boss continuous process, as compared with the old method, as follows:

Tank.	Continuous.
84 12-100 per cent.	86 25-100 per cent.

The loss of quicksilver, though evidently less on the continuous side, could not at that time be determined, as compared with the tank method, as the total loss only could be ascertained. The last months, however, showed a very material reduction in the loss of quicksilver, although the average from the first starting was but 1 10-100 pounds per ton, and this in an ore containing quite a percentage of lead and manganese. The mill with ease handles seventy tons of ore in twenty-four hours, burning only four and one-half cords of wood in that time, and dispensing with not less than eight men employed as tank men by the old method.



CREATE a healthy appetite, prevent malarial diseases, by using Brown's Iron Bitters.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this as well as other notices, at times, by turning a leaf.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, or lending their influence and encouraging favors. We intend to send none but worthy men.

Mechanics' Fair

of San Francisco, 1883.

Will Open at the NEW PAVILION on Larkin, Hayes, Polk & Grove Sts.,

—ON—

TUESDAY ..... SEPTEMBER 11th

And Continue until October 13th.

This will be the most comprehensive Exposition yet held in this State of Manufactures, Art and Natural Products. A GRAND CONCERT and other extra attractions each afternoon and evening.

PREMIUMS.

A liberal list of Premiums, consisting of Gold, Silver, and Bronze Medals, Diplomas, and Cash, will be awarded to meritorious exhibits.

Members of the Mechanics Institute, in good standing, are entitled to double and single season tickets at half rates.

Intending exhibitors should lose no time in applying for space.

Full information will be given and sent on application to the Secretary, 31 Post street.

P. B. CORNWALL, President.

J. H. CUTTER, Secretary.

SAN FRANCISCO SHOPPING

Of every description done at lowest San Francisco prices without charge to purchaser.

IDA M. LYNCH,
MRS. D. L. WHIPPLE, Managers
THE PACIFIC COAST PURCHASING AGENCY,
Room 45, Phelan Building,
806 Market St., San Francisco.

REFERENCES, Circulars and samples sent on application.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at publishers' rates.

News in Brief.

A SHEEP herder in Lassen county recently caught a grizzly bear in a trap. He weighed, when dressed, 800 pounds.

THE epizooty is prevalent among the horses in Contra Costa county, and some valuable animals have died from the effects of it.

THE government of Batavia voted £5,000, and the government of Java £1,000, for the relief of sufferers by the volcanic eruptions.

IT is thought the conduit system with telephone and telegraph lines, will quickly supersede the pole-stringing method now in vogue.

THE University of Chautauqua has permanently organized, not a cooking school, but a cooking college, which will probably prove a benefit on a large scale.

THE drought for the past two months has greatly damaged the crops throughout the south side of Virginia. In some sections there will be not more than half a crop of corn, cotton and tobacco. The streams are fast drying up.

THE Navy Department is in receipt of a letter stating that the body of a man supposed to be that of Master Putnam, of the Rogers, was found at Cape Prince of Wales, Alaska, by natives, when the ice broke up in August, 1882.

TWO THOUSAND peasants invaded Krapina, Russia, Saturday, for the purpose of attacking the Jews in that place. The mob was fired upon by the military and one man was killed and three wounded. Fourteen peasants were arrested.

A GOOD AND SERVICEABLE ELEVATOR.—Messrs. Philip Hinkle & Co., whose works are located at Nos. 116 and 118 Main street, S. F., are the pioneers in building and inventing elevators on the Pacific coast. They manufacture all kinds of patent hydraulic, air pressure, steam and hand power elevators, with the latest improved appliances. The Hinkle hydraulic elevator is the most popular in the Pacific States, as it is largely used on this coast, having many merits that other makes do not possess. Among the many that are used in buildings in San Francisco may be mentioned Hallock block, Nevada block, Mechanics' Institute, Union block, Murphy, Grant & Co., Oriental block, besides many other costly and prominent buildings and business blocks. Contractors and owners having in view the construction of elevators in their buildings should consult Philip Hinkle & Co. for estimates before deciding. The individual members of the firm are Philip Hinkle and A. J. McNicoll.

AN OLD ELECTRIC LIGHT PATENT.—The first attempt to manufacture electric incandescent lamps has been ascribed to M. de Chagny, whose operations were said to have been conducted some twenty years ago. The credit of the invention and its practical application, however, are now claimed for a young American, Mr. Starr, whose patent was taken out in 1845.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Seaton Gold Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Dry Town, Amador county, California.

NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 3, levied July 31, 1883, the several amounts set opposite the name of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Martin, A, Trustee	6	5,000	$400 00
Martin, A, Trustee	7	5,000	400 00

And in accordance with law and an order of the Board of Directors, made on the 31st day of July, 1883, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at 528 California St., Room 6, San Francisco, Cal., on THURSDAY, the 27th day of September, 1883, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

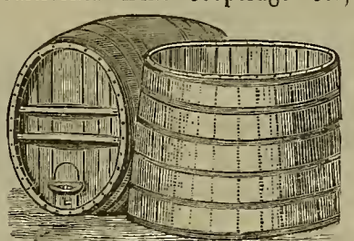
A. MARTIN, Secretary.

OFFICE—Room 6, 528 California St., San Francisco, California.

September 5, 1883.

New Life

is given by using BROWN'S IRON BITTERS. In the Winter it strengthens and warms the system; in the Spring it enriches the blood and conquers disease; in the Summer it gives tone to the nerves and digestive organs; in the Fall it enables the system to stand the shock of sudden changes.



In no way can disease be so surely prevented as by keeping the system in perfect condition. BROWN'S IRON BITTERS ensures perfect health through the changing seasons, it disarms the danger from impure water and miasmatic air, and it prevents Consumption, Kidney and Liver Disease, &c.

H. S. Berlin, Esq., of the well-known firm of H. S. Berlin & Co., Attorneys, Le Droit Building, Washington, D. C., writes, Dec. 5th, 1881:

> *Gentlemen:* I take pleasure in stating that I have used Brown's Iron Bitters for malaria and nervous troubles, caused by overwork, with excellent results.

Beware of imitations. Ask for BROWN'S IRON BITTERS, and *insist* on having it. Don't be imposed on with something recommended as "*just as good.*" The genuine is made only by the Brown Chemical Co. Baltimore, Md.

☞ SHIP, MINING, and WATER TANKS a Specialty. ☜

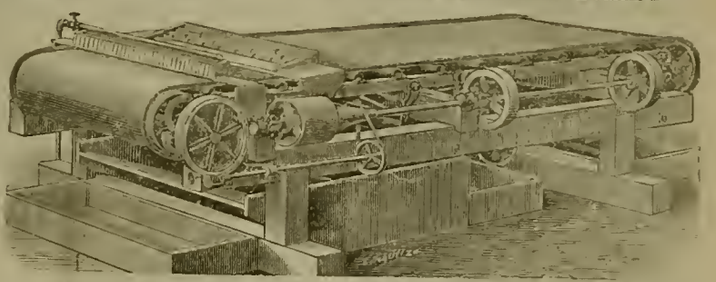
DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company.

San Francisco, September 1, 1883.

At a meeting of the Board of Directors of the above named company held this day, Dividend No. 58, of twenty-five cents (25c.) per share, was declared, payable WEDNESDAY, September 12, 1883, at the Farmers' Loan and Trust Company, in New York, or at the office in this city.



WILLIAM WILLIS, Secretary.

OFFICE—Room No. 29, Nevada block, No. 309 Montgomery street, San Francisco, Cal.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Ratherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

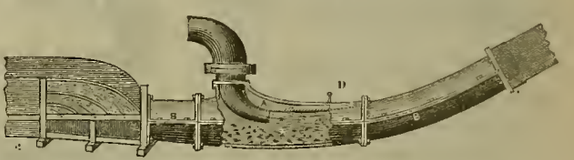
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,



Room 7. 109 California Street, - - - - SAN FRANCISCO, CAL

Nov. 6, 1882.

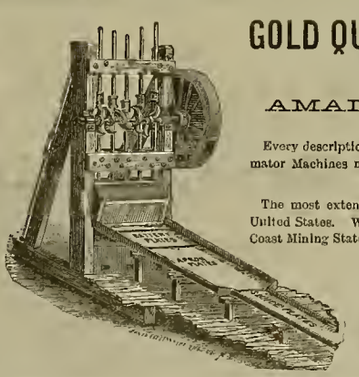
HYDRAULIC GRAVEL ELEVATORS.

The Great Problem of Shallow Hydraulic Mining Solved.

NEW FIELDS OF ENTERPRISE IN HYDRAULIC MINING OPENED UP.

These machines are thoroughly effective for working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.



No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon.

At the property of the Yreka Creek Gold Mining Company, in Siskiyou county, Cal., an Elevator of the Improved Form has been introduced, which, with a head or pressure of water of 266 feet, is elevating through an 18-inch machine to a vertical hight of 46 feet from bedrock to upper flume.

☞ Descriptive Catalogues and prices furnished on application to the undersigned, who are the sole manufacturers of these machines.

WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigating or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

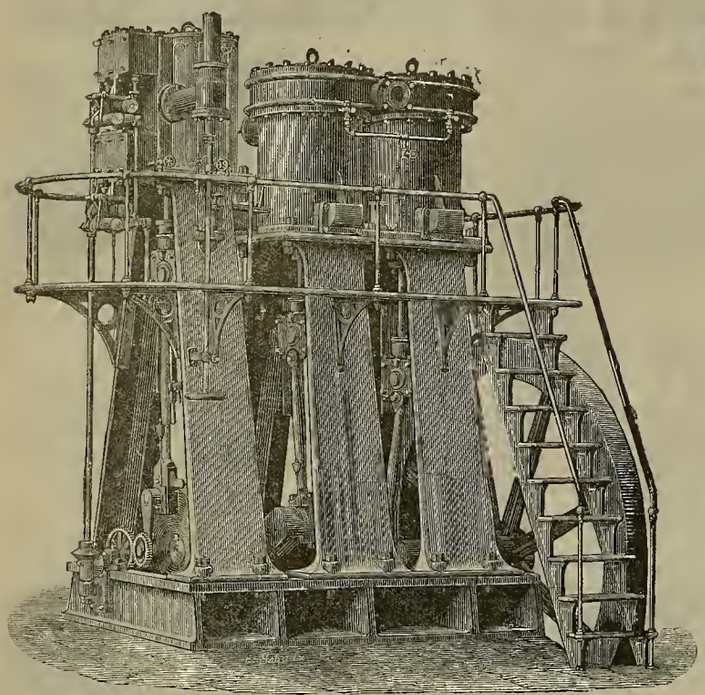
EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 15, 1883.

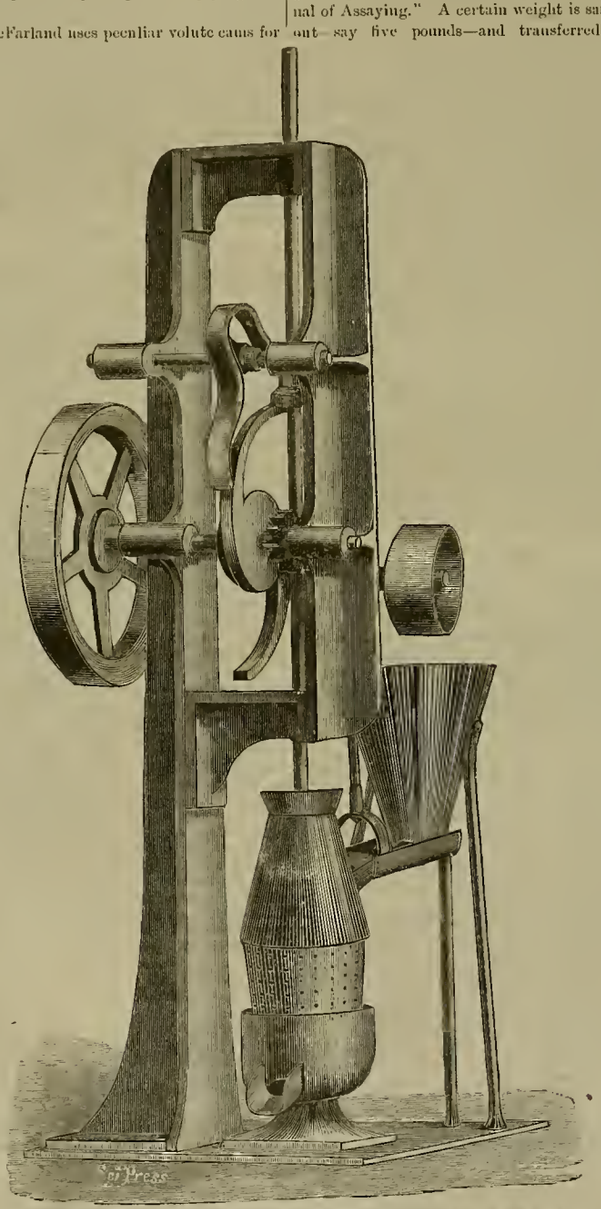
VOLUME XLVII
Number 11.

A New Ore Stamp.

The engraving on this page represents a new form of ore stamp, patented not long since through the MINING AND SCIENTIFIC PRESS Patent Agency by James McFarland, of Carson, Nev. In the ordinary form of stamp battery, a difficulty is found in that, when the cam is revolved above a certain rate of speed, it makes its revolution and catches the tappet before the stamp has had time to strike the die. The object of Mr. McFarland's invention is to overcome this difficulty by providing a means for speeding the stamp so that it will be impossible for the cam to reach the tappet before the stamp has reached its limit of descent.

Extending from the ordinary frame is a bracket or projection in which are the journals for a rock shaft or cross shaft, on which are two diverging arms. One of these arms is curved downward and forward to the tappet, on the top of which its end rests. The end is turned up to avoid interference with the tappet. The other arm extends back and downward, and somewhat in the shape of an imperfect letter S. These two arms are joined together on one hub on the shaft.

The operation of the device is as follows: When the cam raises the tappet the forward arm is raised with it, and the rear arm is drawn inwardly, its lower curve fitting against the back of the cam at the moment the cam relieves the tappet. In its continued movement the cam must force this rear arm outward or backward again, by doing which the forward arm is forced down upon the top of the tappet and accelerates the drop or fall of the stamp. By this construction the stamp must deliver its blow, because the cam cannot free itself from the rear arm until it has forced it back completely, in which position the forward arm must have forced the stamp to its limit of downward throw. From the first impingement of the cam against the rear arm to the end of its contact therewith, the speed with which it is forced out increases, and the descent of the upper or forward arm is consequently increased, thus exerting its force upon the tappet to the very moment of striking the ore in the mortar, or nearly so, according to the height of the ore in the mortar.



At a low rate of speed these arms would play no part, as the drop of the stamp would be fast enough; but at a high rate of speed, the rear arm would be forced out quickly enough to force the forward arm down upon the tappet and speed the stamp.

The principle of forcing the stamp down by which the speed and force of the blow is increased, as shown in this invention, can be applied to stamp mills of the usual construction having any number of stamps of any weight.

The engraving shows the device adapted for a prospecting battery with mortar and self-feeder, the entire mill being made to weigh about 350 pounds; the stamp weighs 20 pounds, and may be run 300 drops per minute. It is intended for working small rich mines, or to be used in large mills for testing small quantities of ore and for sampling. The self-feeding device consists of a small trough hinged at the end under the hopper, the other end being hung on a rod connected with a lever that the tappet strikes. The trough is jarred rapidly, as the stamps drop, and, being slightly inclined, the ore from the hopper feeds into the battery. The mortar, fitted for one stamp, is circular and discharges all around. Without the mortar and self-feeder shown in the cut, it is designed for assay offices, a heavy mortar of the usual style being substituted.

The frame is made so as to allow the stamp to be raised a sufficient height to be entirely out of the way in adjusting or emptying the mortar.

Mr. McFarland uses peculiar volute cams for

McFARLAND'S PROSPECTING BATTERY WITH SELF-FEEDER.

lifting the stamps, which are the subject of a previous patent. These are flat plates of steel, or other elastic metal bent in a proper curve. These elastic volute cams are not liable to fracture, nor do they cause a severe jar or shock when engaging with the tappets. The power is not applied direct to the cam shaft, but to a gear which engages with a pinion on the cam shaft, as the engraving shows. The mill can be run by hand or by any other available power.

Moisture in Ore.

It is frequently a matter of importance to know the amount of moisture or water contained in an ore. A simple manner to determine this, and a satisfactory one at that, is given by Brown in his recently published "Manual of Assaying." A certain weight is sampled out—say five pounds—and transferred to a porcelain capsule the weight of which is already known. The capsule and contents are then exposed to steam heat, in any convenient way, for half an hour, and then weighed. It is then heated half an hour longer and weighed again. There should be but a slight difference in its last two weighings. The difference between the last weight and the original weight of dust and ore is the loss by driving off water. The difference divided by the amount of ore taken, and multiplied by 100, is the percentage of moisture in the ore.

Grizzly Flat Mines.

In conversation this week with Mr. Russel L. Dunn, who has lately made a professional surveying visit to Grizzly Flat, El Dorado Co., in this State, we glean some items of interest from that interesting locality. The district was worked years ago, but was abandoned for a long time, until some three years since. At that time the place again attracted attention, and considerable work has been done in developing the ledges. It is now the principal camp of the county. The Mount Pleasant is the principal mine, being the most developed. Among other important ones are the Mount Hope and Black Hawk, the north and south extensions of the Black Hawk, Treat, Treat Extension, Sacramento and Grizzly.

Nearly all these mines are opened by tunnels, and most of these are on the southeast bank of the north fork of the Cosumnes river. None of these tunnels are very long, most of them being between 200 and 300 feet, only one being 400 feet. There are a few opened by shafts, and one or two mines have steam hoisting works.

The ledges run generally in a northeast and southwest direction. They are mostly "blind," only occasional bunches of croppings being found. The ore is free milling and pays from $15 to $50; the average being $20 to $25 per ton. The ledges average about two and a half feet in width.

Some 30 or 40 stamps have been added to the milling capacity of the district, and others are contemplated. These are private mines. The camp is the best in El Dorado county, and promises very well, work being brisk, and developments being rapidly pushed.

Rosette and Japan Copper.

"Rosette" and "Japan" copper are commercial varieties of copper, the surface of which presents a peculiar red color, due to a coating of oxide of copper formed by throwing water upon the surface of the metal while still in a heated state. The "rosette" variety produced at Chessy, in France, in the Hartz, in Sweden, China, etc., is obtained in thin plates or disks, by projecting water upon the surface of the cake of fluid metal and removing the crust so formed as quickly as solidified, proceeding thus until the whole of the copper is removed in the forming of thin disks, which are then immersed in water as quickly as possible to prevent their further oxidation. This variety contains a considerable amount of the red oxide of copper, and has a dull, red-short fracture. It requires refining before it can be hammered or rolled.

The Japanese variety, instead of forming disks, occurs as small ingots, strongly colored a purplish red tint by throwing them into water as quickly as solidified. It is principally made for exportation to the East Indies. In the preparation of Japanese copper the ore is first roasted in kilns with the required fuel, and the roasted ore is smelted with charcoal in small primitive furnaces supplied with a blast from bellows worked by hand. The regulus or coarse metal so obtained is again roasted and re-smelted, after which it passes to the foundry, where it is refined under a blast of atmospheric air, and the refined metal is then melted in crucibles and cast under warm water into small ingots. In this manner the ingots are obtained with a clear, bright surface of a rich red color.

DAKOTA Territory is four times as big as Ohio.

CORRESPONDENCE.

The Denver Exposition.

[From our Traveling Correspondent.]

EDITORS PRESS:—I send you some notes from the second annual National Exhibition (Mining and Industrial) held at Denver, Colorado, by the Exposition Association, of which H. A. W. Tabor is President, W. A. H. Loveland General Manager, Th. B. McNichol Secretary, F. H. Wilson Assistant Secretary, and Joseph T. Cornforth Treasurer. Though more than a month has passed since the formal opening of the grand pavilion, yet it seems to be only in its opening stages, as new exhibits are constantly arriving and are being put in order.

One remarked, as we approached the grand and showy brick exhibition structure, with its dozen turrets and towering spires, "Denver does not do anything by halves; all her public works are on a substantial scale—churches, schools, city and county halls, firemen's quarters, etc., are all first-class here in Denver." The accommodations are ample, and the building well adapted for a display of double the amount of material now exhibited, and not be at all cramped. Many prominent counties and localities are not yet represented. It is claimed by some that many who engaged spaces for exhibits have not yet brought forward their articles, and that Denver business-houses and industries are not so largely represented as they should be. Yet, waiving all these controversies, this is a grand display of the Centennial State in her youthful strength. Being at her own capital, she can more conveniently make a full display of ores and heavy machinery and agricultural exhibits. But being of a national character, it gathers a wider range of interest; it makes it a social union of some importance.

Minerals from the Southern States.

When I saw that freight car unloading its hundred or more cases of ores, minerals, and various specimens of natural and labor resources, it added not a little to the interest to notice that the car was itself a specimen of work done at the Richmond and Danville Railroad Company's shops in Virginia; that the exhibit was from the Southern States, through which their system of railroads runs, viz., Virginia, North Carolina, South Carolina, Georgia, Alahama and Mississippi. This certainly looks like a united nation, when the same car can come over the Atlantic coast and then across to any extent, only limited by the oceans, and no changing of lading, or any inspection stations to delay. But the pleasant surprise is that they come right here to the geographical center of the nation, and to a hoasted mining center, and make a spread out of over 14,000 pounds of exhibit in the most systematic order, and embracing a larger variety of ores and more of rare specimens than is to be found in any other one collection of minerals now offered. Of wood specimens—all native of these Southern States—near 100 varieties are shown. The native tobacco leaves, of rarest varieties, grown only in Virginia and North Carolina, are elegantly displayed in light glass-covered cases. This whole exhibit is in charge of Mr. C. C. McPail, Chief of the Bureau of Mines and Manufactures of the Richmond and Danville railroad system, who is accompanied by an able assistant.

The table room occupied by this exhibit is over 1,100 feet surface. The small and very rare specimens occupied an upright showcase, which was freely opened and very satisfactory, examinations allowed, and interesting explanations given. The first sample taken out was a crystal of Hiddenite, named after Prof. Hidden, of New York. This is a new gem, a new discovery, and a new composition. It is very rare, and is the same degree of hardness as the emerald; very perfect and usually free from flaws or cracks; shape, long, slender, even-sided; only two perfect cleavages or perfect sides; color light green; worth $120 to $130 per carat, and larger ones a higher ratio of value, as in diamonds. These gems have sold in New York for higher rates than diamonds. In the same mine are found emeralds. The next taken out was a *staurolite*, a very peculiar crystal found in North Carolina hexagon with parallel ends, and found generally one running through another. A curious peculiarity in regard to them is, that in one locality they may join at right angles, all of them, and in another locality join only at an angle of 60°, and in another mine they find them only single and very flat, but with the edges off enough to show six sides, but very different from the quartz crystal; not bright and polished, but opaque, with ashy-yellow shades.

Rutile is a large smooth black colored crystal, but when it is pulverized is red, and is used by the dentists to color their mouth work red. A rare quartz crystal with the satin fibers of asbestos incorporated in the formation is exhibited. Also an equally rare quartz gem, containing a cavity partially filled with a liquid clear and pure as the Denver artesian water.

I will not now say just what that liquid is, for it might be presumed to be presumptuous, as the young man remarked, "no one he thought could tell," and he was told that as soon as relieved from the confinement it evaporated before any analysis could be made. Then he brought out a large black crystal, he called tourmaline. Here again are crystals of corundum from Anderson Co., South Carolina, next to diamond for hardness; this is valuable in lapidary work. When free from flaws and of pink color, it is a ruby, and when blue, a sapphire; when pulverized it forms the best emery. These were long sheets of "flexible sandstone from North Carolina; found in flakes, and is the bedrock of the diamond fields. Some diamonds have been found in this location.

Among other things are beryls; monazites in connection with feldspar; fancy cut marbles; rich specimens of ores from N. C., assaying $504.42 in silver, and $6.50 in gold per ton; another gold, $223.24 and $9.90 in silver. The samples of mica, 15 inches long, are excellent. I do not attempt to mention anything more than a few rare samples taken from the single show case that is well filled with gems and rarities. The 1,100 feet of table surface I leave untouched for the present, with the Commissioner who is able to speak freely, both of the minerals and also of the advantages of the country from which they are mined. I simply introduced this exhibit first, because it seemed to be from the most distant section and more likely to feel as a stranger here. But to be consistent I would have to go on and introduce many of our old Yankee States with their mowers, reapers, binders, traction road engines, plows and cultivators, showing up their fancy family cool safes, refrigerators, and Arctic cream preservers, and such notions as they only can invent; Studebaker, Fish, *et al.* wagons, too nice to use. To introduce all these parties formally would take too much time, for they are great revolutionists and each great in their peculiar sphere. So I will pass on to the big thing of the whole exposition, the heart, the life, the breath, the moving, active power,

The Massive Corliss Engine.

It is of 150 horse power, smoothly and noiselessly moving (with a fly-wheel of 30,800 pounds) all the machinery in the building, yet so free from any jar is it, that a nickel would lie quietly on the steam chest. This fine specimen of the skill of the Frazer and Chalmers Chicago Machine Works, was erected by L. C. Trent, in charge of the Denver branch of Frazer & Chalmers' business. The same engine served the exposition last year. This firm has a large variety of machinery on exhibition, in charge of skillful mechanics showing them in motion. Their varied mining machinery exhibits and attentions to the inquiries of strangers has added much to the success of the exposition, and will no doubt increase Trent's orders for pumps, crushers, engines, concentrators and smelting plants. They exhibited a Comet crusher that will crush ore at the rate of one ton per minute. The material was too scarce to see its capacity tested, but No. 1 will do that much work. This machine has a strong funnel-shaped or flaring hopper, within which is a heavy solid center post, with corrugated surface. This center post at the bottom has a slight oscillating motion, and that motion brings it constantly in crushing contact with the ore that is being fed in the hopper. Near this machine was a new notion of

A Quartz Pulverizer,

And not a crusher—the Sturtevant—patented 1882, Boston, Mass. It is in charge of Mr. J. S. White, of Denver. This machine came all the way from Boston, to show that the old straight line of drop stamps, with its noise, must step down and out for a small cylinder, with two revolving heads turning in opposite directions at the rate of 3,600 revolutions per minute, thus causing the rocks, as fed into the small space between the two heads, to revolve rapidly and thoroughly, and very quickly pulverize on its neighboring rock. It is so arranged that the contact with metal is almost entirely avoided, and that portion that is exposed is reversible, and cheaply replaced by new castings, the part wearing being simply two casing rings, half an inch thick, six inches in diameter, and three inches wide. This little model mill, it is claimed, will crush 8 tons in 10 hours. The full working size, of 15 to 20 inches diameter, will rapidly break up bowlders of 8 or 10 pounds weight, and reduce them to finest powder. The extreme lightness of the plant, and its marvelous ability to convert rock to dust, as was witnessed on several occasions by the visitors, made a favorable impression. Some very ingenious appliances of suction blower, dust chamber, etc., prevents any annoyance or loss from escape of dust from the machine. When the machine is in motion, the rock, by its centrifugal force, is first distributed against the inner surface of the cavity of the machine, in the form of two hollow cones, with their bases touching in the center of the mill, and moving in opposite directions, grinding the rock on the rock, while the metal of the machine is almost entirely shielded by a rock cone formed within, and lies fixed to the inner surface while the contact rocks are grinding. Some of the quartz men who looked at its workings feel much interest in its success. "This man or some other will make this principle a success." "This is exactly the principle we want, for the rock to wear the rock." And such expressions showed their faith that success will yet come in this line of experiment, even if this should be found in some respects imperfect.

The Tasker improved pulverizer, from Philadelphia, placed by the South Pueblo Machinery Co., of Colorado, was not started up. It claims to crush with its seven-ton machine, sixty tons through a No. 60 screen in twenty four hours. Steel cannon balls in a fast-revolving cylinder do the work. Cost of machine, $4,000.

H. N. Nichols & Co., Denver, showed the Sharpneck steam stamp, operating two stamps in one mortar, 120 drops each per minute. This applies steam direct to each stamp, and thus avoids the necessity of engines for crushing. Four stamps are crushing thirty tons daily in actual working at North Platte Mining Co., Gold Hill, Col., saving a very large percentage of cost over an old-style twenty-stamp battery, which took nine cords of wood daily to crush eighteen tons of ore, while with four stamps they are now crushing thirty tons daily with three cords of wood.

The Frue Vanner

Machine exhibited by Frazer & Chalmers is running successfully, and beside it, Tasker's machine, claiming to be an improvement on Frue's; but the matter will probably be settled in court on charge of infringement now pending. The Colorado Machinery Co. had a large exhibit. Their large compound air-compressing engine, built by the Norwalk Iron Works Co., South Norwalk, Conn., is a fine piece of mechanism, and led many visitors to ask for its uses: "Pressed air?" "What for?" etc. For driving rock drills, engines and pumps in mines and tunnels; for displacing water in covered caissons and submerged buoys; used in raising sunken ships; for the sand blast; in carving stone or glass, thus doing the work of 100 men in etching and ornamenting glass. This sand blast is one of the great American inventions. The compressed air is used for pneumatic elevators, for forcing liquids, acids, etc., upward by surface air pressure, for refrigerating processes, and various mechanical, philosophical and chemical uses and purposes. It is a machine that forces just common air into useful services; and so great is the success already made, none dare prophesy what may yet be accomplished by this simple element and man's inventive genius. Connected with the mining machineries, there were several steam hoisting works, very near compact, and fine specimens of working machinery exhibited by different firms. Also, competing steam pumps of the latest and best patents, running constantly, showing how easy and accurately they could be gauged by the engineer to pump slow or fast. We could not pass this point without a close inspection of Mr. Huson's

Wire Cable Tramway,

To convey ores from the mine to the mill or smelter, over rough mountain cliffs and chasms, by an endless wire cable that is moved by steam or water power. The moving cable is supported by grooved wheels elevated as convenient, and on this cable are secured suspension boxes or buckets, which are loaded and unloaded automatically with the most satisfactory precision. This is certainly a grand achievment of success. It is claimed to be far superior to the great English tramway erected in White Pine, Nev., for the Eberhart mine. This is so simple and safe that it will answer well for various transportations in places of dangerous travel, and across streams and chasms. The inventor is off superintending the erection of trams in the mines, and trusts to another to run the machine here exhibited. This may yet form a safety valve for those suffering to have aerial traveling, and take the place of ballooning for the novelty of the sensation.

But here comes L. C. Trent (Frazer & Chalmers), agent for Hallidie's wire tramway, and having no less than eight plants of Hallidie's tram in full and successful operation in Colorado, and he claims that Mr. Huson is infringing on the patented rights of Hallidie's tram. One of Hallidie's trams is in use at the Iowa and Consolidated mining company at Summitville, Col., and Mr. John H. Gear, President of the company, says of it: "This spring I placed the engine, boiler and crusher in place at the mine, and on the 2d of this month (August) I commenced crushing ore at the mine for the tramway to carry to our mill, 3,700 feet. The tramway works to a charm in every particular. It will transport to our mill in ten hours more than our mill, forty stamps, can crush in twenty-four hours. I would say, at a speed of 250 feet per minute, that is, if the buckets are fully loaded, it will carry nearly 200 tons in twenty-four hours. It beats bull teams badly."

And here is Mr. Watson's elevated railroad in practical operation, a bicycle single rail railroad, with which he proposes to cheaply avoid all cost of grading of ground, all difficulty of snow drifts, much of the cost of ordinary track laying, and a large per cent saving on the materials used, and in the end have a safe road. He even imagines he sees the big wheat grower inclosed not with a barb wire fence, but with his railroad track, and instead of hauling off his grain in wagons he will drive his trains to the different depots on the border of field, and there load the grain direct on the cars, and when loaded a span of horses could run it out on to the direct or main line. The model was quite crude, and yet it performed well on a true circle track of eight feet diameter. Mr. Watson is quite aged now, and may not realize or see fully accomplished all that he supposes of the possibilities in his invention which he has patented; but I see no reason why it may not yet be adapted to useful purposes. There would doubtless be a large percentage in favor of success in applying it to a full sized working machine instead of a small model.

I will let this suffice for first talk of the Denver exposition and rest here for the present letter, and in next talk some of minerals, etc.

B. W. CROWELL.

Denver, Aug. 30, 1883.

Good Fortune Camp.

San Andreas District, Socorro Co., N. M.

EDITORS PRESS:—I send you a short account of our mining district, that may be of interest to prospectors and those seeking for a favorable place to invest in mines.

We are located about 35 miles east of the Rio Grande river, in the San Andreas mountains, in the range extending north and south from near Santa Fe to the old Mexico line, between the Pecos and Rio Grande rivers, the whole range being mineral bearing in gold, silver, copper, lead and coal.

The district, extends from the Fort Stanton road on the north to the mouth of Antelope Canyon on the south, and from the Gypsum plains on the east to the Jornada de la Murta on the west—a tract of about ten miles square.

It was discovered in the spring of 1881 by Messrs. Heath, Miller and Cole, but did not attract much attention, as the first ores discovered were low grade argentiferous galena on the surface.

Since then, as the district became more fully prospected, a number of excellent copper claims were located; first at the mouth of Bear Canyon, then north along the edge of the Gypsum Plains toward Soledad mountain (or Salinas Peak) being mostly in a granite formation.

Then came the discovery of more copper in Red Canyon to the west. Numerous locations made in the Red Hills (a sandstone formation) and on the contact a limestone formation. Chloride ores were then found, the assays running into the hundreds, Mr. Carr being the fortunate discoverer.

Copper again was found to the north on the edge of the district, the leads extending across the Fort Stanton road in the neighborhood of the Dripping Springs.

The galena silver leads are numerous, running north and south between porphyry and limestone, and readily traceable for several miles.

There are also a number of iron capped leads, that so far as known have almost invariably turned out to be good mines wherever found in in this Territory, but so far they have been but little worked in this district.

Excellent galena silver claims are owned by Messrs. Carleton, Taylor, the Friend brothers, Smith and Hamlin. Mr. Hamlin's claims are now being worked by a Chicago company. The Good Fortune mine has changed hands. They have a shaft about sixty feet. High assays were reported by the former superintendent, Mr. Phillips. The new company is expected to commence work some time this autumn. The Eureka copper mine and group of claims have just been bought by a St. Louis company, who are much pleased with their purchase and expect to begin work at an early day.

Negotiations are now going on for the purchase of a group of copper claims owned by the Messrs. Friend, Cooper, Green, Stevens and others, situated in the northern part of the district, near the Stanton road. Messrs. Miller and Carr also expect to complete a sale of their copper mines.

The Messrs. Mooney, Thompson, Easter, Cooper, Taylor and Smith, also have some good copper properties in the Red Hills. Carleton, Welch and McDonald have located claims in Antelope canyon showing copper glance. The Mexico and U. S. Syndicate are joint owners with Mr. Smith, of the San Andreas, of a number of galena silver claims, and iron-capped leads. The Cooper brothers and Howerth are working on the Homeward, and are down over thirty-five feet.

Col. W. W. Alexander and his partner are at work on their copper mine in Antelope canyon. Mr. Smith is opening up his Red Hill copper mine. Considerable work has been done on the Big Casino and Little Casino mines, the White Cliff, Asteroid, Black Tail, Jim Blaine, Great Southwest, and Jo Dandy claims. Take it altogether, the prospects of the San Andreas district are brightening. It only requires the influx of capital to make this one of the most flourishing mining districts in New Mexico. The miners and prospectors here have held on bravely, through good and bad report. They were run out three times by the Indians the first year, and then came a long season of discouragement.

Now fortune seems to smile on them, and all are looking forward to reaping the reward of honest toil, and be recompensed for the years of privation and hardship undergone.

There is no more favorable place for capitalists to seek investments in mining properties. There is an abundance of silver, copper and lead ores, magnetic iron, etc. The ores are easily reduced.

It will well repay mining men and capitalists to pay a visit to "Good Fortune" camp, in the San Andreas mountains. The camp can be reached either from San Marcial, Engle, or Lava stations, on the Atchison, Topeka and Santa Fe railroad. BUENA VENTURA.

Good Fortune Camp, San Andreas District, Socorro Co., New Mexico.

IN the Blue Wing silver district, east of Bannack, Montana, there are more miners at work at the present time than there have been for a number of years past. Many of the mines of that district are looking well, and are producing a good quality of shipping ore. The Blue Wing district is looming up, and the ore yield for this winter will be of considerable value.

MECHANICAL PROGRESS.

Improved Machinery.

Improved machinery enables a certain number of men to produce more of any kind of goods than they could before the introduction of such machinery. This, unless there is something done to counteract it, necessarily causes overproduction. The proper and natural way to balance this is to shorten the days of labor, or lessen their number. The inevitable result of the employment of machinery is either to shorten the days of labor or to decrease the number of persons employed; but to do the latter would be to pauperize a portion of the people. It would be the wisest and most humane plan for workmen to labor a less number of hours than the average in times of depression, and to work a greater number of hours than the average in times of more than usual activity. This would be better than to discharge surplus hands in the one case, or to rake the world for additional and inferior ones in the other. In the one case, it would divide the burden of depression equally among all the workmen, instead of placing it upon the shoulders of the few and allowing the many to escape, and in the other it would obviate the necessity of employers engaging inferior workmen, with all the attendant evils. This plan, if put in operation, would also tend to make prices more uniform, by preventing an accumulation of unwieldy stocks during times of depression, and by insuring against scarcity in times of activity; for in many cases manufacturers accumulate larger stocks than they otherwise would, because they dislike to discharge any of their employes. They dislike to do this for two reasons: first, because it often causes distress; and second, because when they again need their discharged men they may not be able to get them. Thus we see that the regulation of the hours of labor in accordance with the demand for the products of labor would tend to regulate stock, and therefore demand and prices, and consequently the demand for labor. It would also obviate the expensive necessity of manufacturers keeping in their works a great deal of machinery that is seldom called into play except in times of great activity, and which also often helps to make stocks too large. These few hasty thoughts might be pondered with profit by those most interested.—*Iron Age.*

Iron Shutters vs. Wood Incased in Tin.

Mr. Edward Atkinson, in a note on the subject of iron shutters for buildings, says:

Of all the materials in common use, and which are commonly depended upon for preventing destruction by fire, there is none so treacherous as unprotected iron, with the possible exception of granite. Iron doors and iron shutters may have occasionally appeared to prevent the passage of fire through a window or doorway, but such successes can only have been attained either by their not being subjected to great heat, or else by their being drenched and kept cool with water. Whenever and wherever they have been exposed to severe heat, they have been so quickly warped and twisted as to have become practically useless as safeguards, while they have often prevented access to buildings, and have thus greatly increased the loss or damage from the fire raging within. There is nothing yet invented which can be said to be absolutely fire-proof by which window spaces or doorways can be protected; but the heavy wooden door or shutter incased in tin will retard the action of fire in sufficient measure to give the firemen a fair chance to put it out in the room in which it starts. If two thicknesses of inch board (pine preferred, because it does not warp) are nailed crossways, and fully incased in tin, locked and soldered, and thoroughly nailed under the locking, the outer surface of the wood under the tin will be speedily reduced to charcoal by the action of heat through the combustion of the small amount of oxygen under the tin. The charcoal itself then becomes a very effective non-conductor of heat, and if the tin is tight, so that no further supply of oxygen reaches the unburnt wood beneath the charcoal, it will remain cool and strong for some hours, thus giving time to control the fire where it starts.

The Characteristics of Good Wood.

Rankine says that there are certain appearances characteristic of good wood, to what class soever it belongs. In the same species of wood, that specimen will in general be the strongest and most durable which has grown the slowest, as shown by the narrowness of the annular rings. The cellular tissue, as seen in the medullary rays, when visible, should be hard and compact. The vascular or fibrous tissue should adhere firmly together, and should show no woolliness at a freshly cut surface; nor should it clog the teeth of the saw with loose fibres. If the wood is colored, darkness of color is in general a sign of strength and durability. The freshly cut surface of the wood should be firm and shining, and should have somewhat of a translucent appearance. In wood of a given species, the heavy specimens are in general the stronger and the more lasting. Among the resinous woods, those having the least resin in their pores, and among non-resinous woods, those which have the least sap or gum in them, are in general the strongest and most lasting. Timber should be free from such blemishes as "clefts," or cracks radiating from the center; "cup shakes," or cracks which partially separate one layer from another; "upsets," where the fibers have been crippled by compression; "windgalls," or wounds in a layer of wood, which have been covered and concealed by the growth of the subsequent layers over them; and hollow or spongy places in the center or elsewhere, indicating the commencement of decay.

A NEW METHOD OF FORMING WIRE ROPE.—Messrs. Craddock & Co. of Wakefield, England, are now manufacturing a special rope in which the wires and strands are both twisted in the same direction, thus giving a much longer surface of the wire exposed to friction, which lessens, if not entirely removes, the cause of wires breaking on the crown of the strands; and as the working of the rope around drums and pulleys bends the wires in an oblique direction, the greatest amount of wear possible from the wires is secured, as they will not break until too much reduced, and become therefore too weak for their work. The wires in the strands on this principle have a longer bearing one against another than in the ordinary system, and prevent much injury which results from the wires in each adjoining strand cutting into one another. There is claimed for this rope greater durability and immunity from wires breaking when but slightly worn.

A SUGGESTION comes from England, which spelter manufacturers would do well to consider seriously. All over the world, spelter is cast in thin slabs, probably because it has always been done so since spelter was made. Mr. J. B. Sharp, of Birmingham, urges that in that form it is about as bad as it could be for causing loss by volatilization, when melting in the preparation of copper-zinc alloys, and for retaining lead impurities, which adhere to the lower part of the film in thin flakes which are not removable. He insists that the best way would be to cast the spelter in the form of round 3 or 4 inch ingots, vertically, keeping the mold hot when casting and allowing it to cool slowly. The form would be more convenient and more advantageous for remelting and the lead would gather at the bottom in a piece which could easily be detached.

FLANGELESS WHEELS.—On the Hamburg tramways a number of cars with flangeless wheels, much like omnibuses, and with turning gear, are working. To run on the lines, these cars are fitted with a shaft in front of the front wheels, this shaft carrying on a lever a disc wheel which the driver can lower into the tramrail groove as he requires, or raise it when it is necessary to get out of the way of obstructions. The arrangement works well, saves a lot of trouble, and the cars run easier than those with flanged wheels.—*Engineer.*

GRINDING metal surfaces as a method of finishing or reducing, says the *American Machinist*, is every day coming into greater use. Another step in this progress is made by an invention of Wm. B. Fenn, Meriden, Conn. This consists of a grinding and polishing machine arranged so that the work will be automatically passed beneath the grinding and polishing surface, or brought against it at any desired angle. The work is transferred and held by movable carriages which are capable of a wide range of position.

OUR WOOD-WORKING MACHINERY.—It is an indisputed fact that American wood-working machinery is preferred in most foreign countries to that of any other make. We mean by this those countries in which no such machinery is manufactured. In fact, not a few of our machines find their way into England, France and Germany each year; but who ever hears of foreign wood-cutting machines coming to America? In plain truth, our wood-working machinery, like our agricultural implements, beats the world.

GRINDING SURFACES.—If great accuracy be desired in work that is to be ground, use a wheel that has a hard metallic grinding face, as cast iron or brass, or the wheel may be coated with hard type metal. Emery and oil may be used on the wheel; or it may be imbedded in the wheel when the surface is of type metal. If a fine surface or a high polish be desired, a wheel coated with soft lead may be used and fine emery applied. With a scanty supply of emery a fine finish can be obtained.

STEEL STAMPING PLATES.—Liverpool advices state that steel stamping plates have displaced the charcoal tins almost entirely, but the steel-plate rollers complain that the prices are too low. Tinners offer less for steel than for charcoal plates, notwithstanding the former are more regular in quality.

THE Westinghouse brake has become so thoroughly recognized as the best device for stopping railroad trains that it is now being very generally applied even to freight trains. It is said that the Westinghouse Co. have orders now on hand to fit up not less than 60,000 cars with this device.

SHRINKAGE in lumber varies according to the tree from which it is made. Oaks will shrink in drying a half inch to the foot, while the redwoods of California show no perceptible change, and the heavy Eastern or South American woods lose but little.

SCIENTIFIC PROGRESS.

The Mysteries of Nature.

The process by which food is converted into living tissue is wonderful and mysterious. "Can there be a more striking metamorphosis than that of the constituents of the egg (albumen, yolk and egg-shell) into the constituents of the young bird (flesh, bones, feathers, etc.)? or the conversion of milk, which constitutes the sole nourishment of so many young animals, into flesh, blood, etc.?" There can be no doubt that chemical changes take place in the living animal as they do in plants, but they are far more mysterious, and more complex. It is a well recognized fact that the body is daily undergoing just such changes as occur after death. From the moment of birth until the hour of final dissolution the body is constantly dying. The difference between the body while living and after death is that in life it is able, by the process of nutrition and assimilation, to repair the waste that is constantly going on, while after death waste goes on without repair, so that the body is finally resolved, dust into dust. It will be observed that the body is not resolved into any of the organized elements that supported it during life, but into the inorganic elements from which his food originally drew its sustenance. There is no doubt, also, that these inorganic elements, resulting from the decay of animal substances, may again enter into the formation of vegetables. But this subject is exceedingly complex. The following, which was written by Secchi, the illustrious physicist, shortly before his death, probably contains the germ of the whole question:

"If it be said that a special principle is necessary to produce and to preserve a certain series of operations, without which the animal would yield to ordinary chemical forces, it is true: but if further than this, it is contended that in the living animal there is in the action of the vital elements a force independent of the ordinary molecular action, and that this depends on a chemical action different from that which takes place in organized bodies, it is false."

This daily waste and decay is replaced by the action of the organs of digestion and assimilation on the various substances introduced into the stomach and known as food and drink. It becomes, then, a question of great importance to every one to know from what kind of food he can best renew the daily waste and furnish a fresh supply of healthy blood to feed the tissues that are decaying. The question of heredity is, for some, a very important one, as influencing their health and the duration of life. The question, "What to eat?" is of the highest moment to every one.

There are two conditions necessary to carry on the process of nutrition—one, the ability, on the part of the organs of digestion to take the nourishment from certain substances which are called food; the other, some principle in the food which yields to the organs of digestion the required pabulum, by which the body is enabled to grow, and to maintain its strength by repairing the waste which is constantly going on in the system.

Electricity Not a Form of Magnetism.

Prof. Hughes has recently advanced views about magnetism, which, if accepted, will largely modify the position which science assigns to this property. He asserts that where there is no apparent magnetism, or the magnetism is neutral, there is not, as has been supposed, an indifferent turning of the molecules in all directions, with consequent balancing of influence, but, on the contrary, there is a perfectly symmetrical arrangement, the molecules (or their polarities) arranging themselves so as to satisfy their mutual attraction by the shortest path, and thus form a complete closed circuit of attraction. When magnetism becomes evident, the molecules (or their polarities) have all rotated symmetrically in a given direction, but the symmetry of arrangement is such that the circles of attraction are not completed except through an external armature joining both poles. Again, he shows that we have permanent magnetism when the molecular rigidity retains the molecules (or their polarities) in a given direction, and transient magnetism whenever the molecules are comparatively free. Prof. Hughes also shows that the inherent polarity or magnetism of each molecule is, like gravity, a constant quantity, which can neither be generated, nor augmented, nor diminished, nor destroyed. Neither can magnetism be changed to any other form of force or property of matter. Electricity may be generated by magnetism, just as light and heat (as in the case of the sun) may be generated by gravitation; but electricity is not a form of magnetism any more than light or heat is a form of gravity.—*Contemporary Review.*

The Upper Limit of Human Audition.

This subject has recently been studied by M. E. Panchon, and his results have been communicated to the French Academy of Sciences. The notes were produced by a powerful syren of the kind invented by Cagniard-Latour, and actuated by steam. The highest audible notes produced in this way had 72,000 vibrations per minute. M. Panchon has also vibrated metal stems fixed at one end, and rubbed with cloth powdered with colophane. In diminishing the length of the stem the sharpness of the note is increased. Curiously enough, he finds that the length of the stem giving the limiting sound is independent of its diameter; and for steel, copper and silver the lengths are in ratio to the respective velocities of sound in these metals—that is to say, as 1,000 for copper, 1,002 for steel and .995 for silver. Colophane appears to be the best rubbing substance. When the acute sound ceases to be heard, the sensitive flame of a gas jet is still affected by it. While upon this subject, we may mention that Mr. Francis Galton has recently invented a "hydrogen whistle," which enables him to obtain notes far above the upper limit of human hearing, his object being to test the hearing powers of insects, which, as is well known, have very acute ears. The number of vibrations produced by a gas in a whistle is universally proportional to the dentisty of the gas, and, as hydrogen is 13 times lighter than air, the sounds produced by it in a given whistle are 13 times shriller—that is to say, the pitch is 13 times higher. Mr. Galton has made a whistle .14 inch long and .04 inch in diameter, which with hydrogen gas, gives a sound of 312,000 vibrations per second. The whistle is fitted with a piston at its base to regulate its length, and it is probable that still higher notes can be obtained with a shorter length.

HARDENING SOFT LIMESTONES.—According to *Engineering*, alkaline silicates are occasionally employed to give certain limestones a greater hardness. When the limestone is saturated with a solution of these salts, it quickly becomes covered with a more or less perfectly impervious glazing, but it is difficult to secure the correct proportions, and soluble salts and water may be left within the stone, the latter causing slow disintegration from subsequent freezing, and from other causes. To obviate these disadvantages, M. L. Kessler proposed, in a paper recently presented to the Academy of Sciences of France, to use the fluor silicates of magnesium, aluminum, zinc and lead, instead of the alkalines used in the former processes. In this case, only insoluble salts would be formed throughout the stone, and a more homogeneous material would be obtained. If greater hardness is not aimed at, but only a granular, marble-like surface, it will be sufficient to make a paste of water and the powder of the limestone, to let this dry on the stone, and then to apply the silicate. By mixing this with the silicates of copper, iron, chromium, etc., the various colors of marbles may be imitated, and the color would, as in the natural rock, be uniform through the whole stone. The materials are not more expensive than those of older processes.

NITROGENOUS FERMENTS IN HUMAN MILK.—Bechamp has published a paper in *Comtes Rendus* on milk, in which he says that cow's milk contains two distinct albuminous substances besides casiene. One of these remains insoluble in alcohol after it has been precipitated by alcohol, and is an enzymotic substance which possesses the power of liquefying starch without first converting it into sugar. Dumas and Cahour have already proved that the enzymotic constituent of woman's milk possesses much greater power than that of cow's milk, nearly equal to diastase. Bechamp isolated the enzyme by the following process: Normal slightly alkaline woman's milk was carefully acidified with acetic acid, and then at least three times its volume of ninety-five per cent alcohol was added. The very bulky precipitate was collected on a filter, washed with weaker alcohol to remove the milk sugar, then with ether to remove the fatty portions, and then taken up with distilled water. After a few hours it is filtered. The solution thus prepared possesses to a high degree the property of liquefying starch and converting it into sugar. Twenty or thirty cubic centimeters of milk are sufficient to prove this assertion.

EROSIVE POWER OF GLACIERS.—Both from mechanical and physical considerations, Mr. A. Irving concludes that too much erosive power has been attributed by some writers to glaciers, and that it is doubtful if the work of actual excavation has been accomplished by them at all. He attributes the differential movement of glaciers to the following causes: 1. Crackling and regelation, as explained by Tyndall and Helmholtz. 2. Generation of heat within the glacier, as set forth by Helmholtz. 3. The penetration of the glacier by luminous solar energy, the absorption of this by opaque bodies, such as stones, earth, organic germs, etc., contained in the ice, and the transformation of it in this way into heat. To these causes he attributes the greater differential motion of the glaciers by day than by night, and in summer than in winter.

BLASTING paper has been made by J. Petry, of Vienna. It consists of unsized or ordinary blotting paper coated with a hot mixture of seventeen parts yellow prussiate of potash, seventeen of charcoal, thirty-five of refined saltpeter, seventy of potassium chlorate, ten of wheat starch, and 1,500 of water. When it is dried it is cut into strips which are rolled into cartridges.

ARTIFICIAL FILTERING STONE.—K. Steinman, a German, proposes filtering plates from the following mixture: Clay, 10 or 15 parts; levigated chalk, 1 part; glass sand, coarse 55 parts; glass sand, fine 25 to 65 parts; ground flint, 15 to 30 parts. The ingredients are mixed thoroughly in water, molded, and hard burnt.—*Dingler's Journal.*

FIFTEEN carloads of immigrants arrived recently in Toronto, from Iceland. There were 700 persons in the party, about 400 of whom will settle in the Western British Possessions. The others will take up land in the Western States.

The Coming Fairs.

This year's fairs promise to be of unusual interest, and to command the attention and patronage of the people to a greater degree than formerly. We give below a list of the coming fairs of which we have record of dates:

Mechanics' Institute Fair, in San Francisco, September 11th to October 13th.

Ninth District Fair, at Rhonerville, Humboldt Co., September 18th to September 21st.

Stockton Fair, at Stockton, September 18th to 22d.

San Mateo and Santa Clara District Fair, at San Jose, September 24th to 29th.

Twelfth District Fair, at Willets, Mendocino county, September 24th to September 29th.

Eleventh District Fair, at Quincy, Plumas county, September 24th to September 29th.

Oregon State Fair, at Salem, September 17th to September 22d.

Contra Costa County Fair, at Pacheco, October 1st to October —.

Seventh District Fair, at Salinas City, Monterey county, October 2d to October 6th.

Tenth District Fair, at Yreka, Siskiyou county, October 3d to October 6th.

Mechanics' Institute Fair, Pavilion, Portland, Or., October 8th to 20th.

Sixth District Fair at Los Angeles, October 8th to October 13th.

Santa Barbara Fair, at Santa Barbara, October 10th to 12th.

Santa Cruz Fair, at Santa Cruz, October 10th to October 14th.

Tulare Valley Fair, at Visalia, October 17th to October 21st.

Mining Share Markets.

The mining stock market has been dull this week. The leading mines show no changes of moment, so whatever fluctuations there have been in stocks were not occasioned by any new developments in the mines. The outlook, however, throughout the whole extent of the Comstock is now thought to be more favorable than it has been in many months. In the Union Consolidated, the south drift on the 3000 level has passed through a series of streaks of quartz, some of which contained good ore, but not enough to bring the whole up to the paying point. These streaks, now crossed by the drift, were making toward the southwest, as though to join the seven-foot ore streak lying on the west side of the drift. At the Hale and Norcross they are fast nearing their 2700 level, at which point a station will be made and crosscutting commenced. As the ranchmen of Carson valley have agreed to turn all the water back into the river at the end of two weeks, it is thought the mills may then start up. Once the mills start, operations may be resumed in the Gold Hill mines.

Bullion Shipments.

Horn Silver, Sept. 4th, $24,000; Vienna, 4th, $9,500; Hanauer, 4th, $16,000: Stormont, 4th, $2,800; Hanauer, 6th, $3,340; Crescent, 6th, $7,410; Bullionville, 6th, $6,236; Ontario, 6th, $11,591; Horn Silver, 6th, $12,000; Alice, 7th, $11,116; Lexington, 7th, $112,150; Moulton, 7th, $7,500; Ontario, 7th, $4,451; Horn Silver, 7th, $18,000; Ontario, 8th, $4,232; Hanauer, 8th, $6,400; Cresent, 8th, $7,370; Hanauer, 11th, $5,300; Alhambra, 1st, $2,847; Mt. Diablo, 3d, $13,243; Christy, 1st, $3,572; Syndicate, 6th, $9,623; Contention, 8th, $19,204. During the week ending September 8th, there were shipped from Salt Lake 51 cars of bullion, 1,272,635 pounds, sent East; 39 cars of ore, 242,400 pounds, sent to St. Louis; 15 cars of ore, 459,860 pounds, sent to California, and 1 car of white lead, 22,000 pounds, sent West, making a grand total of 106 cars, aggregating 2,596,895 pounds.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MIDDLE BAR TUNNEL.—*Ledger*, Sept. 8: The people of Amador do not realize the vast scope of this undertaking. The prevalent idea is that it is simply for the purpose of operating the Hamilton and Mammoth mines, which lie immediately north. This is one of the objects, but not the most important one. The stockholders in the tunnel are also shareholders in the two mines named. After running 1000 ft, the big bore is expected to strike the ledge on the Hamilton ground at a depth of 800 ft, and when it reaches the Mammoth shaft another 1000 ft beyond, it will be over 900 ft from the surface. The advantage of a tunnel outlet at such a depth, for draining and extracting ore, cannot be overestimated. But this object would hardly justify the construction of a large and heavily equipped tunnel, at an expense of $100,000. The enterprise has a far wider scope. It is no: intended that the tunnel shall stop when it reaches the limit of the Mammoth ground. Before that an arrangement will be made with the owners of all claims along the main belt clear through to Jackson, by which the tunnel owners will acquire certain guaranteed rights in the event of their claims being operated by means of this tunnel. It would tap the Zeile mine at a depth of 1300 ft, and the cost of transportation and crushing would be reduced to a minimum. The resources of the region between Jackson and the Mokelumne are comparatively untouched. The surface has been merely scratched over. Except at the Zeile, not a shaft has reached anything like a depth of 400 or 500 ft. But the magnificent developments of the Mammoth mine warrant the conclusion that this unexplored country is destined to be the banner district, not only of Amador, but of the main quartz lode of California. By means of this projected tunnel $4 or $5 rock can be worked at a profit.

NOTES.—The Mahoney Co. have notified the judgment creditors that they will no longer look after the property. The creditors have accordingly placed parties in charge. A contract has been let to run 100 ft further in the tunnel on the Doyle claim. James Morgan will resume work on both his claims forthwith. Only a partial clean-up of the Oneida mill on rock from the Jackson mine has been made. A thorough clean-up will be made in a few days. A strike was made in the Doyle claim this week, which promises to be of importance. The ledge is 15 ft wide, and full of sulphurets. The sulphurets are of a light color, resembling those met with at the Zeile.

Calaveras.

WEST POINT.—Cor. *Chronicle*, Sept. 8: The Bowlder Ranch gravel claim, on the Amador side of the Mokelumne river, have completed their tunnel to the bed of gravel, where they have struck a good prospect. In the Star of the West, Mr. Richardson, the superintendent, informs me that they have struck another body of galena which is exceedingly rich. On the Scorpion work continues and the prospects are encouraging. They are sinking a new shaft and have already struck on the ledge, which prospects fine and is 6 ft wide. In the Champion, Haskins & Hadler keep digging away, their prospects, at present not being very encouraging. On the Valentine the machinery is all up and ready for work. The Sterling mine is now running in full blast. They have 3-ft ledge and good paying ore.

COOK AND SCHWOERER.—*Citizen*, Sept. 8: The recent discovery by Cook and Schwoerer was not penned as a sensational item. The ore which they transport to town, is sufficient evidence. Richard Spence is also the happy finder of gold-bearing quartz the lead being about 10 inches in width. Both the above discoveries were made during the month in the vicinity of Indian creek. This section has been celebrated for gold-bearing lodes. The once famous claim known as the old Wood mine yielded a handsome amount but being of a pocket formation was shortly worked out. The Potter, Wallace and Pfeiffer, Al. Henry, Caruthus and the Old Calaveras are all included and located in this section.

Fresno.

MOUNT RAYMOND.—Mariposa *Herald*, Sept. 7: We are informed that Messrs. George Hearst, Sam Curtis, and San Pedro, the gentlemen who visited Mt. Raymond district last week, bought three mines—The Harlow, Van, and one other—for the sum of $30,000, and that $4,000 in cash was paid on the 29th of August to bind the bargain. All tests of the rock heretofore have been made with the view to smelting, but the gentlemen named took a quantity to San Francisco to try its milling qualities, and if the result is satisfactory, operations upon a large scale will be commenced. All the miners who have visited this district, agree that it will prove to be a big bonanza or nothing.

Nevada.

FLEMING.—*Transcript*, Sept. 8: Owing to the death of the Secretary and one of the Directors, and to the absence of the President in Mexico, Capt. James D. Fleming as a stockholder calls a meeting of the Nevada County M. Co. A recent clean-up at the mine proved highly satisfactory, and the chute now being opened will from appearances pay between $25 and $30 a ton.

NEVADA CITY MINE.—Everything is lovely at this mine. They have just completed the job of lowering a 10-inch pump from the 450 to the 600 level. The mine is looking better and more men are employed than ever before. The Nevada City is a big mine.

Plumas.

BLOUGH & HARVEY.—Quincy *National* Sept. 8: Mr. Jonh Hardgrave, of Taylorville, gave us a call on Saturday, and brought a box of specimens from the new strike in the Blough & Harvey mine. The tunnel to the Lucky S No. 2 has reached the ledge, and developed a four foot vein which prospects better than anything heretofore discovered there. The rock is rich, and the owners are highly pleased with their prospects. They have decided not to put up machinery before next spring, but will continue the work of development and take out quartz in quantities sufficient to warrant the expenditure necessary to put up first-class machinery at that time.

San Bernardino.

GOLCONDA.—"We have taken a stroll through the mines," says the editor of the *Print*. Of Mrs. Townsend's mine, the Golconda, he speaks as follows: "Mrs. Townsend sent one ton of first-class ore to Jerome Fargo, of San Francisco, to have it tested. It was divided into four equal lots and taken to four different mills, and resulted in an average of $900 per ton. The ore was taken from the line of the Golconda and Alhambra, and partly from each claim. The ore is divided into three grades, the first averaging, according to assays, $2,000 to the ton and the second $200. The owners of the Golconda are Mrs. A. K. Townsend, who owns one-half interest, J. H. Cook, one-third interest, and A. M. Rikert, (nephew to Commodore Vanderbilt,) one-sixth interest. Considering the amount of work done on this claim it presents a finer showing than any other in that neighborhood. It has a good ledge to follow and shows considerable evidence of permanency. While enjoying the hospitality of Mrs. Townsend in her neat and comfortable cabin in Deep canyon, where she lives with her father and little daughter, we were shown an ore sack full of beautiful specimens from the Golconda, some of which contained bright particles of wire silver. Mrs. Townsend carefully assorts all her own ore and has become quite a practical expert in mining business."

Sierra.

GIBSONVILLE.—Downieville *Tribune* Sept. 6: In the Tabor mine the company are raising a shaft 200 ft; 140 ft of it is completed. W. S. Chapman, a San Francisco capitalist, is interested with Mr. Tabor. The company have a tunnel in 2300 ft through hard rock. The rock is getting softer. The people here are anxiously awaiting the development of this property. Mr. Tabor has already expended over $30,000 of his own money in prospecting the mine.

POKER FLAT.—Mr. Linsey, of Howland Flat, is prospecting a quartz ledge near town. The ledge is well defined, and fine specimens have been found.

NOTES.—The Nebraska Co., at Howland Flat, have let a contract to run 400 ft of tunnel. The Bonanza Co. are increasing their working force. The Gibraltar M. Co. have let a contract to John Schramm and Fred Drimpin to run 200 ft of tunnel. The Sunnyside Co. are pushing work and expect to strike gravel in a short time. Some rich claims have been worked in the vicinity of Sunnyside.

MARGUERITE MINE.—Supt. Shaw took his departure for Boston last week, leaving President Humbert in charge of affairs. * * * *

Later.—Since setting up the foregoing, work at the Marguerite has been suspended. It is stated that the company owe $10,000 in this county. There is something mysterious in the manner in which the affairs of this company have been conducted. It is well known that the mine has yielded handsomely. We trust that the Boston manipulators will return a little of the mine's production, enough to pay off the debts and open up the mine as it should be.

BRANDY CITY.—A portion of the machinery to be used at the Brandy City mine arrived last Thursday. The company have already run 216 ft of their new tunnel by hand. They now have an open cut of 200 or 300 ft to run, after which they will commence work with the Burleigh drills. It will take at least 2 years to complete this enterprise, at an estimated cost of $100,000.

TABLE ROCK.—The Table Rock M. Co., whose property is near Howland Flat, are pushing ahead their main tunnel. The tunnel is now in 2600 ft, and recently soft rock has been encountered. There are 10 men employed.

BALD MOUNTAIN.—The Bald Mountain Extension Co. cleaned up 150 ounces of gold Sunday out of the South Fork mine at Forest City.

NEVADA.

Washoe District.

SOLID SILVER.—*Enterprise*, Sept. 8: Thomas Crowley, late of Como, has been appointed superintendent, and commenced work on the first inst. As yet but one shift is employed, but as soon as the tunnel is repaired work will be pushed with three. At several points the tunnel cut rich feeders, and the largest of these will be followed.

GOULD AND CURRY.—East crosscut No. 2, on the 2300 level, was extended 263 ft, when the diamond drill was put in and run out a further distance of 134 ft, all the way in hard porphyry. The drift passed through a vein of fine-looking quartz, which shows a width of 130 ft between clays.

UNION CON.—The south drift on the 3000 level has passed through a series of stringers of quartz. It is now out about 60 ft, and the face is in vein porphyry. The joint Sierra Nevada winze, below the 3000 level, is down 55 ft.

OPHIR.—West crosscuts Nos. 1 and 2 on the 150 level are making good headway. They have passed through some old drifts not found on the maps.

MEXICAN.—The upraise from the 2900 level is fast draining the winze down from the 2700 level. The ground is still hard and the men are discommoded by the water which streams down upon them. Good headway is being made in the main north drift on the 3100 level.

ALTA.—The water had yesterday been lowered to a point 40 ft below the 1300 level by the tanks. The rod was connected and the pumps at the 1300 started last night.

SIERRA NEVADA.—The main north drift on the 2900 level is pushed ahead rapidly. It will open up to exploration a large area of very interesting ground.

BEST AND BELCHER.—The north drift on the 2500 level is slowly draining out. Work will be resumed in it when the flow has sufficiently decreased.

YELLOW JACKET.—The only work being done below the surface is on the Sagebrush level, from which point some ore is being extracted.

HALE AND NORCROSS.—The winze below the 2600 level still carries streaks of ore at the bottom. The winze is nearing the 2700 level, at which point a station will be opened and crosscuts made.

NORTH GOULD AND CURRY.—Work was resumed in the shaft last Thursday with two shifts of miners.

IMPERIAL.—The work of putting in order the hoisting machinery progresses well.

BELCHER.—The ore dumps are full, and awaiting the starting up of the mills on the Carson river.

SCORPION.—The west crosscut on the 500 level is passing through ground that shows occasional streaks of clay and quartz.

ANDES.—Both the west drift and the winze are in hard quartz. This quartz is metal-bearing.

CROWN POINT. Active mining will be resumed as soon as the river mills can reduce the ore.

UTAH.—Good headway is making in the main north drift on the 1300 level. The drift is cutting some streaks of quartz.

SAVAGE.—Work will soon be resumed in the drift on the 2600 level, where there is much unexplored ground.

CHOLLAR. Prospecting will not be resumed until the new hydraulic pump goes into operation.

UNION SHAFT.—The work of easing timbers at the 2300 station will soon be completed.

CALIFORNIA.—Are making the usual progress.

CON. VIRGINIA. The usual progress is being made in all underground work.

Candelaria District.

NORTHERN BELLE. *True Fissure*, Sept. 8: The crosscut from the southwest drift on the fifth shaft level has been extended 9 ft. The face is still showing sulphurets. The crosscut to the south has been advanced 12 ft into soft slate, showing some barren white quartz. There is an improvement in the stope from the fourth shaft level, both in quantity and quality. The stope from the upraise from the fourth shaft level is again yielding a small quantity of ore, and looks promising. On the General Thomas location, in running a tunnel from the surface, quite an important development has been made. A vein of ore, 3 ft in width, has been uncovered, giving every indication of permanence. Everything is running smoothly at the hoisting works. Both mills are running as usual. The total bullion shipments for August amounted to $27,946.57.

MOUNT DIABLO.—The stope from lower winze No. 2 is giving considerable $50 ore, and the ledge shows some improvement in the east end. There are several places below the third level, near winze No. 1, that are turning out considerable ore of fair grade. The stope above the west drift from the Callison winze shows some improvement. In the eastern end the ledge is wider, and of better grade. A shipment of bullion was made on August 30th of $5,237.04, and one September 3d of $8,006.98, making the total for August account $64,915.50.

COLUMBUS CON.—During the past week the work has made rapid progress in the shape of drifting from the shaft to the old workings. It will take about twenty days to make this connection, and until it is made no work will be done towards the extraction of ore.

Esmeralda District.

MOUNT CORY WORKS.—Hawthorne *Herald*, Sept. 8: Work at the Mount Cory Reduction Works is fast nearing completion. The mason and carpenter work is nearly finished, and most of the machinery and iron will be on the ground in a few days. The return of Supt. McKenzie lends new impetus to the work, and the people of this section will no doubt soon have an opportunity of seeing one of the largest and most complete reduction works on the Pacific coast.

Eureka District.

EUREKA CON. *Sentinel* Sept. 6: The water in the Eureka Con. new shaft stands at a height of 60 ft from the bottom. The machinery keeps it at this point without difficulty. Supt. Read is convinced that the flood comes from a reservoir which is being gradually emptied, for if the water came in by a current it would have been pumped out before this time. He says he has not the least doubt but the water will all be removed in time.

STAR DISTRICT.—Allen G. Campbell made a large purchase of mining interests in Star District last week. The purchase comprises the interest of P. Kemple in the following named mines: Kanarrah, Mountaineer, Clean Sweep, Wasco, Quebec, Wasco No. 2, Vulcan, Reindeer, and Conomongh. The price paid was nominally designated as $8,000.

LEACHING OR MILL PROCESS.—W. F. Leon and D. J. Jaekson, are visiting Eureka. They will investigate the process of reducing ores at the Geddes & Bertrand mill, with reference to leaching the ores from the Belmont mine. Mr. Fassett, the superintendent, recently tried 10 tons of the ore in the company's mill and 10 tons by leaching. By the latter process the ore was worked up to 95 per cent and by the former up to only 67 per cent; while the cost of reduction by leaching was, of course, considerably less than by mill process.

MARTIN WHITE.—The late report from the superintendent says: Although small, this is the best find of ore that we ever had on this level, in my estimation, as it is directly under the best ore bodies of the upper levels, and it will probably connect with them. The Secretary's report shows that there is $33,513.30 worth of supplies on hand and ore extracted valued at $44,182.30.

PARADISE.—J. V. McCurdy shipped yesterday from the Paradise Valley mill one bar of bullion, valued at $1,725.

HARRIS MINE.—Reno *State Journal*, Sept. 1: Some developments have been recently made in the Harris mine, in the mountain back of Washoe City. Within the last day or two the ledge has widened from 20 inches to 4 ft. Instead of the base ore heretofore found, there is an entirely new character of quartz. It literally sparkles with gold.

EUREKA TUNNEL CO.—*Sentinel*, Sept. 8: The semi-annual report says: The ore extracted from the mine for the six months ending Aug. 31 amounts to 1,425½ tons, of an average assay value of $63.87, giving us a net product at furnace of $52,113.99, approximating $36.57 per ton. The bulk of this was taken from the hard vein forming what is known as the Addison chamber and called chloride ore. The exploration of the mine to a depth of 150 ft below the tunnel level proves the continuity of the ore body first found in the south drift from the main tunnel.

Tuscarora District.

ARGENTA.—*Times-Review*, Sept. 6: North crosscut, 400 level, is in 73 ft; progress for the week, 16 ft.

ELKO CON.—Shaft No. 2 extended 11 feet. Total depth 112 feet.

GRAND PRIZE.—West drift north lateral vein, 300 level, extended 23 ft. South drift 300 level is in 66 feet; progress, 13 ft. North crosscut, 400 level, extended 15 ft.

NORTH BELLE ISLE.—Good progress has been made in extending the drift south on the 300 level. Have commenced stoping ore on the 70 level. The stopes show a high grade ore.

INDEPENDENCE.—Total length of drift north on the 300 level, 753 feet; progress during the past week 21 ft. North on the 400 level 30 sets of timbers have been replaced.

BELLE ISLE.—North on the 450 level the drift has been extended thirteen ft; total length, 244 ft. No. 1 drift north on the 350 level has been advanced 18 ft.

NAVAJO.—Drift south on the east lateral vein, 350 level, has been extended 8 ft; total length, 508 feet. The connections between the 450 and 350 have been completed, and from the south drift on the 450 level a crosscut has been started west. Station at the 650 level will soon be ready to receive the new pumps.

INDEPENDENCE.—*Times-Review*, Sept. 7: The Supt.'s annual report says: During the past year we have extracted and milled 267 17-20 tons of ore, averaging $322.88 per ton. The Navajo Mining Co., having the mill in use, milled our ore for us at the rate of $25 per ton, net cost, and worked it to 93 per cent of the battery assay. We received and shipped to the Anglo Bank of California bullion to the amount of $62,910.45, and after deducting bullion discount on the balance of the bullion, and paying for the milling of the ore, we received from the Navajo Co. in coin, $8,472.07. The ore seam averaged very small, but the grade of ore ran unusually high. This ore was extracted above the 300 level, and considerable work has been done in the same locality without discovering any more ore. The prospects are very flattering for good results, when crosscuts are extended from the drifts now being driven north and south on the 300 and 400 levels.

ARIZONA.

MCMILLAN.—Globe *Chronicle*, Aug. 25: The mill is running night and day. There are from 15 to 20 men employed about the mine. We understand there has been quite a ripple of excitement at Moor's camp, caused by the late rich strike in the Imperial mine. This mine is on a line with the Stonewall.

MINERAL PARK.—*Alta Arizona*, Aug. 25: A rich strike is reported in the Burke mine in Music mountains. The proprietors, Welton & Grounds, have 5 men working and expect to increase the force. They are taking out $200 rock and hauling it to Hackberry to ship to Argo, Colorado. After a run of less than three weeks the Mineral Park mill has made a clean-up. The best ore worked this run was from La Porte's mine, near the Ithica. It is a free milling chloride ore and sampled over $500 per ton.

NOTES.—Prescott *Courier*, Aug. 29: Mr. Murry, of the Verde M.'Co., Black Hills, is in town and tells us that the smelter continues to do good work. The shipments to and from the smelter average 500 tons a month. The Groom creek mill and concentrator are working ore from the King Kelly mine. Hathaway tells us that 16,000 pounds of bullion were, Saturday, sent to the railroad from the Howell reduction works. Mr. Dawes' friend, at Tip Top, says that sinking on the 900 level is going on day and night. Alter & Co.'s Catocton ledge has between 5 and 6 ft of quartz, 20 inches of which assays hundreds of dollars per ton in silver. The Dosoris mine continues to yield the richest kind of silver ore. W. B. Murry, of the United Verde Co., says that in one day's run with a 30-ton smelter, 16,000 pounds of black copper, assaying 97 per cent, and two tons of copper matte, 75 per cent stuff were run out. Better still, the silver, 540 ounces in every ton of copper, made the day's run worth about $7,000.

HUACHUCA.—Tombstone *Epitaph*, Sept 2: Pat. Bracken, of the Lena mine in Cornell district, Montezuma canyon, is delighted with the outlook of Cornell. The Lena mine is being actively worked, and has an open cut of 50 ft, showing a well defined ledge of galena. With a force of 8 men they are now shipping 40 tons of paying ore to the Charleston smelter.

CARLISLE.—Mr. E. B. Gage brought back with him samples of ore from the Carlisle mine, from the bottom of the 180-ft shaft, which he had assayed. The result was: silver, $694.53; gold, $369.57; total $1,064.10. This mine is now considered one of the richest in the country.

THE FAMR MINE.—*Silver Belt*, Aug. 25: There are 70 tons on the dump which will average $250 per ton, and a satisfactory showing of ore in sight, in the mine. Ten men are at work.

PIONEER.—The South Pioneer mine is taking out lots of rich ore on the different levels. The Howard M. Co.'s 10-stamp mill has been running a couple of months, and its run has not been excelled in the district, having turned out over $60,000 worth of bullion. The Pioneer 5-stamp mill is badly in need of water,

NOTES.—Pinal *Drill*, Sept. 1: At the King all the damage by the storm has been repaired and all goes on as usual. On the Mount View they are drifting and are obtaining very fine ore. They work three shifts. The Speciepaying is sinking for water for their mill. They are down 70 ft and have found water, but not in sufficient quanity. At the Surpriser, ten miners are working accumulating ore. The mine will be thoroughly developed before starting the mill again. The Frankfort is west adjoining Monareh of the Sea. They are sinking a shaft and are down 40 ft. They are in ore, similar to the Silver King. Syenite carrying zinc blend and averaging $40 per ton silver. The Monarch of the Sea, adjoining, is again at work.

COLORADO.

TELEPHONE.—Georgetown *Miner*, Sept. 1: On Saturday 3,200 pounds of Telephone ore, milled at the Pelican works, netted $635.66, the first-class going 677 ounces, the second-class 253 ounces and 35 per cent lead. The product of the mine for 27 days with two men working was $1,280. Part of this time was spent in drifting.

CORRY CITY.—The 90-ft shaft has been pumped out and drifting started east and west. There is a 14-inch pay-streak, which assays from 49 to 63 ounces. On the tunnel level a stope is being raised over the shaft. A 12-inch streak of ore was uncovered for 20 ft, assaying 280 ounces. An average sample from the tunnel level drift ran 250 ounces.

READY CASH.—J. M. Wilson called Monday with half a dozen specimens from this mine at Williams Forks, La Plata district. They were literally spattered all through with native silver. The specimens came from a point 170 ft in the adit tunnel. The ore in the raise will average four inches all the way. Pieces weighing 300 and 400 pounds are shot down, all carrying the same kind of ore. There is a 400 pound specimen on the dump now.

MONTEZUMA.—The Sisapo sampling works shipped 77 tons of ore last month, and 200 tons the first 24 days in August.

VULCAN.—A recent run of three tons from the Vulcan mine gave 271 ounces per ton.

SNOW DRIFT.—One hundred sacks from the Snow Drift, Republican mountain, second-class, shipped Saturday, ran 108 ounces silver per ton. The last shipment of first-class went 535.

SEVEN-THIRTY.—This mine, owned by H. M. Griffin, is employing 40 men. The levels being run are the 240 ft east and west, the 310-ft east and west, and the 375 ft west. All show mineral. A lot from the 240 level ran 706 and 257 ounces silver per ton. Another lot from the same level on the 18th inst., brought 638, 235 and 104 ounces silver per ton.

LEGAL TENDER.—Denver *Tribune*, Aug. 29: Professor Stearns, of Washburn college, Topeka, thinks that this has as promising a future as any mine in the State. Five assays were made from ore from five different portions of the shaft, and averaged $102.42 silver, $4.13 gold and $1.50 lead. The lowest run ever made was $31.93 silver to the ton, the highest assay being $1,086.03. The ore is the sulphide and chloride of silver, sulphide and carbonate of lead, from 12 to 13 per cent, silica, from 7 to 10 per cent. of iron and a very small percentage of manganese and zinc. The most remarkable feature of the mine is the immense quantity of ore in such easy shape for mining.

ALICE HYDRAULIC.—*Courier*, Aug. 30: The yellow dirt overlying the talc will wash an inch string of gold to the pan. The ground washed at present is known to be much richer than any heretofore washed. Considerable native silver is found in the sluices, one chunk as large as a hen's egg being found a short time since.

INVINCIBLE.—Idaho Springs *News*, Aug. 24: From Mr. John Owen we learn that on Tuesday a one-half interest in the Invincible mine was sold, the consideration being $25,000. This property has come to the front within the last two years, and now bids fair to become one of our big mines.

NOTES.—A carload of assorted ore from the Little Mattie shipped to Black Hawk this week netted $2,000. A carload of ore of 11 tons, shipped last week from the Albro, netted $76 per ton. The Queen lode on Seaton mountain is worked by lease. The result of six men working 25 days, drifting and stoping, was nine tons of ore shipped on the 20th inst., netting $1,450. The Rio Grande lode in Spring gulch, is owned by Jones, Camp and McMann. Developed by shaft 100 ft; 4 men working one shift sinking shaft; 10 inches of solid ore in bottom of shaft, two specimen assays of which ran $106 and $70 gold and silver.

IDAHO.

ATLANTA.—Wood River *Times*, Aug. 29: At Atlanta Hill, sucessive discoveries have proved the existence of a mineral belt extending five miles from north to south, and four miles from east to west. The veins with the exception of the Atlanta, the mother lode, all have a general southeasterly and northwesterly course. These "feeders" are of enormous width; the Tahoma has an average width of 35 feet; the Leonora, 15 ft of ore, and an equal width of ledge matter; the Magnet 30 ft; the Alaska the same; the Last Chance (or Atlanta Hill) 60 ft. Although discovered 20 years ago, small quantity of work has been done. The greatest depth attained is in the Monarch (or Atlanta), about 400 feet. As it costs $80 a ton to realize on ore, none assaying less than $100 could he worked; many thousands of tons of ore assaying less than $100 are therefore awaiting less expensive modes of reduction. Better times are at hand. The Atlanta has a regular Comstock three-compartment shaft, with drifts or levels opened at every 100 ft, and running to the ledge, where straight drifts are run both ways, with crosscuts to the walls at regular distances. Col. Pettit, who is in charge, has cut the three ore chimneys on all the levels from surface to the 400, and it is estimated that there is over $2,000,000 of ore in sight. It is thought by competent judges to be likely to prove a second Comstock.

THE BACKBONE.—The camp of Bullion—the "Backbone" of Wood River—is experiencing a reawakening. During the past few weeks the force at work has been greatly increased, and there is not an idle man willing to work in Bullion to-day. The Wood River Mining Co., which owns the Bullion-Ophir group, has 100 men at work; the Mayflower, Jay Gould, O. K., Eureka, and other companies must be employing between 300 and 400 more. Then the production of the camp will probably amount to 30 tons per day, as follows: Wood River Co., 10 tons; Mayflower, 5 tons; Jay Gould 5 tons; Idahoan, 10 tons. This besides the first-class ore, the yield of which will amount to 25 tons per day.

RUTH AND HEATH DISTRICT.—This district is on Snake river, 70 miles north of Weiser city, 30 north of Olds' Ferry, and 275 from Hailey. Very little work has been done there, but on one claim—the Greenhorn. Mr. Ruth has showed up an 8 ft face of ore, some of which goes as high as $4,500 per ton, and the whole of which will average $900. Mr. Ruth has a two-stamp mill about 1½ miles from the mine, and he works alone, doing the mining, packing on his own animals, milling and cooking himself.

SHEEP MOUNTAIN.—*World*, Aug. 28: Myron Crafts, assayer for the Custer Co., was in Sheep Mountain district a short time ago to make arrangements for putting up a smelter at the Mountain King mine. It will be packed into Sheep Mountain and put up as soon as possible. Nick Johnson's train of thirty-five animals was loaded three times this summer with Mountain King ore, which was smelted at Bay Horse. The cost of packing was $60 per ton; smelting $40, and the owners of the mine received $45 after paying all expenses, so the ore ran $145 per ton.

LEONORA.—*World*, Aug. 31: Hon. Jas. White informs us that the frame-work for the Leonora mill was up when he left Atlanta, and part of the machinery was on the ground. The mill is a ten-stamp. The Leonora is half-way between the town of Atlanta and the Atlanta mine. There is a very large body of it that pays to mill. George Timms' mine, north of the Atlanta, is turning out good rock. A crushing will be made in the Buffalo mill this fall. The Last Chance, between the Atlanta and Buffalo is a good mine. The ledge carries gold, and the ore is free-milling.

QUEEN OF THE MOUNTAINS.—Ketchum *Keystone*, Sept. 1: The Queen of the Mountains mine, on Warm Spring creek, has been leased to Reiff and Montgomery for one year, and these gentlemen are about to put on a crew to work the mine for ore. They have also purchased a one-fourth interest in the same.

MONTANA.

ANACONDA.—Cor. of *Miner*, Aug. 25: Since my last the "Swansea of Montana" has made rapid strides. There are now over one hundred buildings in the town and a safe estimate places the population at five hundred. The Anaconda Co. are pushing work on the smelter, upon which two hundred men are employed, in running the tunnel for the mill race, building arches for the calcining furnaces, laying the foundation walls, grading for the concentrator and lining the ditch with lumber.

MAIDEN DISTRICT.—The Ore Cache Co. has, in connection with its mine a substantial mill with a capacity of 10 stamps. In twenty-five days this has turned out 400 ounces of retort, valued at $17 per ounce. By the first of Sept. a new 20 stamp mill will be completed. Custom ores will be worked. Ten concentrators will be at work. The ore in the Collar is silver bearing. Work is being done on the 150 shaft. At 70 feet a level of 40 ft to the northeast has been run. In neither level has the northeast wall been found, which shows an immense lead.

PONY.—Cor. Butte *Miner*, Sept. 1: The Willow Creek, which is developed by tunnels on the ledge to a depth of nearly 200 ft, has an ore body from 12 to 15 ft in width, averaging $24 per ton, with almost 700 tons of quartz on the dump. The upper half of the Ned has two tunnels on the lode, the lower one 200 ft in depth and its face producing from a 2½-ft vein ore averaging $35 per ton, of which there is several hundred tons on the dump. The White Pine has a 2-ft vein of $45 ore, and is developed by shaft and levels to a depth of 200 ft. The 500 ton dump pile is rapidly disappearing through the 10-stamp mill of Thomas Carmin. The Boss Tweed, with its 30-ft body of fair concentrating ore, is locked in the close embrace of six or seven separate owners, who won't do this and who won't do that. The most of the property is owned by Henry Elling, who is erecting a 20-stamp mill, with Blake crushers, etc., the whole to be run by a Leffel turbine. The mill will be ready for crushing about the first of October. The Potosi mines, 10 miles from here, are being represented by their owners. The mines assay well, but their owners generally have not the means to develop them to any great extent. Cummings & Williams are erecting a five stamp mill in Hot Spring district. Norwegian gulch is being successfully worked by a flume—Wilson & Co.'s.

SUMMIT VALLEY.—Butte *Miner*, Aug. 29: The bullion shipments for the week amounted to $78,864, credited as follows: Alice, $23,680, Lexington, $35,408 and Moulton $19,770. The consignments of matte and copper-silver ore at the U. and N. freight office aggregated 870 carloads, 340 of which were copper matte and 530 ore. The principal obstacles to development in the Summit Valley district are the high prices set upon mere prospects by excited holders, which drives investors to other districts, and the lack of custom mills, sampling works or a market for our ores. There are in the district upwards of 200 mines, which are more or less developed and which the owners believe would pay large profits if facilities for reduction were at hand. At the Moulton work is vigorously prosecuted in the west workings and the stopes are looking better than ever. The winze from the 300 southwest drift is down 70 ft and in a 3 ft ledge of 40 to 50 ounce ore. At the Alice no special developments have been made during the week. Work is prosecuted with activity, and the usual amount of ore extracted from the Alice and Magna Charta. The west drift from the 800 has advanced 105 ft, the ledge maintaining its width, grade and uniform character.

NEW MEXICO.

KEYSTONE.—Kingston *Tribune*, Aug. 30: The Keystone mine, South Percha, owned by George Webber, is down 20 ft in depth. The crevice is 5 ft in width, with mineral all through the gangue rock, some of it assaying high in silver.

BULLION.—The Bullion Co. is shipping its 15th carload of high grade ore. The net returns so far amounted to $50,000. The average value is, therefore, over $3,000 per carload. In addition, there is a large dump of lower grade ore which will be concentrated as soon as the new machinery arrives. Fifteen thousand dollars has already been paid in dividends from a mine which cost but $10,000 about one year ago.

NOTES.—A large body of 41-ounce ore has been struck in the Ivanhoe mine. The shaft of the Black Prince at Bullard's Peak, has attained a depth of 46 ft with high grade ore the entire depth. A ledge of ore 9 ft wide that averages 700 ounces of silver was recently discovered west of Silver City. A carload of ore from the mines of the Solid Silver Co., at Bullard's Peak, Golden, Col., netted between $7,000 to $8,000. By legal appointment, the Columbia mine at Lake Valley was sold last Saturday to the Sierra Bella M. Co. for $30,500.25. The title has rested one-third in Hon. John A. Miller, and two-thirds in the Sierra Bella Co. It is a subject for congratulation that their quarrels are now ended.

SILVER CITY NOTES.—*Southwest Sentinel*, Aug. 25: Dane & Berg have the contract for the erection of the Deming smelter. It is to be 30 by 60 ft, and have a capacity for 30 tons per day. The machinery arrived a few days ago, and the work of putting up the building is going rapidly forward. The Tres Hermanos district, in Grant county, is coming to the front. Since the Deming smelter has become an established fact, claim owners in that district have gone to work with a will. The main shaft of the Old Man mine is down 60 ft, and a drift has been commenced to meet the tunnel. The entire level is in solid ore, and as soon as the drift and tunnel are joined, the company will commence sinking deeper. The force is being increased as fast as room can be made.

Examination of the Carson Footprints.

(CONTINUED FROM LAST WEEK.)

Footprints of the Deer.

I use the term provisionally; they may belong to the peccary. Close under the cliff, near the series No. 1, we found a line of tracks made by an animal with a sharp pointed, broad heeled hoof. Whether this was a cloven hoof, we could not decide, because the impressions were made in quite soft mud into which the foot of the animal must have sunk two or more inches, and when retracted each hole was in a great measure closed. The best two prints give the length of the impression 2½ inches, and the breadth of the heel 2 inches.

We measured the relations of 10 of them and found the average straddle was 8 inches, and the average longitudinal distance apart of the consecutive imprints of the 5 of the left feet is 2 feet 9 inches; and of the right feet is 2 feet 7 inches. But the range of these distances is 7 inches, and of the straddle over 4 inches. The pathway was not straight, nor was the mud quite uniform in stiffness. The footprints of each side indicate that each hind foot exactly, or very nearly, covered each corresponding forefoot.

Footprints of a Large Bird.

Of the numerous prints of a four-toed bird we selected four for measurement because the line was nearly straight and the distance nearly even. Other imprints were even more distinctly marked near one of the large quadruped imprints which Mr. Gibbes has referred to in his first description as "several confused tracks of a man and some large animal" (page 2), but these latter bird tracks were in a short curved path and the pace irregular.

In those measured the step or pace was twenty and one half inches, the length of the middle toe four and one half inches, of the two side toes from tip to tip seven and one half inches, and of the hind and thinner toe two and one fourth inches. In this track the hind toe was pointing inward, both for the left and right foot.

The wader which made these tracks would be that of a good sized heron or crane.

Footprints of the Tiger.

I use this term provisionally. On the lower floor are several lines of tracks, some of which are very obscure as to details of structure, but apparently made by a four-clawed animal. Our limited time forbade us examining all of these lines minutely, but we traced four pairs of double tracks of another animal, which we have provisionally designated a tiger, and of which I present a drawing. The animal was bounding from the line of the cliff towards the N. N. W., and unfortunately the surface of the stratum impressed has been badly scarred by rocks tumbled upon it in quarrying. The first pair of tracks is obscure; the next three pairs very well marked, the marks of the nails in the extended claws being clearly impressed, and the toe-pads also. On the same horizon are the tracks of the same species of bird as already described, and also the faint impress of the so-called man. These latter are fairly well outlined by the fact that there has undergone, in the compressed clay or mud, a certain oxidation of iron which gives its red color to the imprint. But one of these latter footprints is certainly duplicated at the heel as if one foot had stepped nearly in the track of another, and at the outer tiger tracks it seems, from the impression, that these were made after the impress of this so-called man track.

I judge by the increased length of the successive strides, as well as by the extended claws, that the animal was bounding. Beyond the last pair of tracks the horizon is destroyed. There are tracks of an unknown animal a little to the right of the prolongation of these tracks; apparently it had four sharp pointed toes or claws. Beyond these indefinite ones occur two pairs of tracks which might be made by a wolf; of these Mr. Gibbes has taken casts.

The accompanying diagram is introduced to illustrate the general character and relative position of the tiger tracks, except as to direction, as the animal swerved somewhat to the left. The left feet impressions are larger than those of the right, and at the third pair, either the left foot slipped back or there was a duplication. I incline to the former explanation; and it will be noticed that in the alternate pairs the left foot is at a greater distance forward of the right foot, as 12 and 12 to 6 and 2 inches.

The average straddle is only 5 inches; the consecutive longitudinal distances between the left toe of each pair are respectively 4 feet 8 inches, 5 feet 6 inches, and 6 feet 6 inches. I have not drawn the imprints to scale, nor have I been accurate in details of structure, because casts will be made of them. The positions and sizes of the bird and so-called man tracks are only approximated in the drawing as of secondary importance in this relation.

Footprints of the Horse.

By removing some quarried rocks Mr. Bell exhibited a line of tracks which seemed to have been made by a horse, because the impress of two of the best of them showed satisfactorily the existence of the frog of the horse's foot. The depth of the first one had preserved it from injury in quarrying, etc., and at the bottom the length was five inches and the breadth four inches; at the surface the length was six inches. These imprints indicated to my eye that the foot was more like that of a mule than a horse; and as my party is constantly using both animals in our geodetic surveys we are somewhat familiar with the different footprints.

The average longitudinal distance apart of the imprints of the right side is five feet, two inches; of the left side five feet, three inches; and the breadth of the straddle is about four inches, but the line of travel is not straight. The accompanying diagram illustrates upon the same scale as the others the stride and size of the footprints of this animal.

Nearly parallel with this line of march are several other lines of apparently a similar animal, but the imprints are relatively obscure as to structural details. The general features, however, are similar.

Footprints of a Bos.

Provisionally we have referred to this animal as the "nondescript." Close under the eastern cliff there is seen the impresses of five feet. The animal was apparently a short stepper, had cloven hoofs, and a body so heavy that the feet sank deeply into the soft mud layer, probably to a harder layer below. It would appear that when the foot was withdrawn the mud was in such a plastic condition that it inflowed sufficiently to obliterate the bottom marking of the hoof. The surface of the layer is marked by heavy rain drops, and there are bird tracks near it.

There are only five of these footprints, when the animal turned to the left and the horizon is lost. The average longitudinal distauce apart of the left imprints is two feet two inches; and the average longitudinal distance of the consecutive footprints, one foot one inch; and the straddle six inches.

So far as measurements could be fairly made, the average length of the double hoof was three and three-fourths inches, and the breadth nearly three inches. Three of them were two and three-fourths inches broad at the heel, and two consecutive ones first before the animal turned were three and a half broad.

These imprints present somewhat the appearance of a heifer's tracks, and Capt. Hooper, of the U. S. Revenue Marine, who has had the experience of two seasons in the Arctic, says they immediately suggested the reindeer tracks to him, although the latter are broader.

A Fine Curved Line.

Near these imprints is a sharp, double looped curve cut in the soft mud. It is roughly indicated on the canvas from memory. It is a fine-cut line ranging from one-half to one millimeter across, and less than that deep. I removed some crystals from one part of it to test its having been made at the same time as the nondescript.

Footprints of the Dog

A line of tracks provisionally assumed to be those of a dog exhibit a peculiarity of gait, which is shown in the unfinished drawing, instead of progressing with apparently alternate steps, we see a progression by alternate pairs; *i. e.*, two steps rather close to each other or side of the line of march, then a wider space to similar tracks on the other side of the line of march.

The structural details are moderately good.

Another drawing of similar but larger footprints was made by Mr. Gibbes; it exhibits this peculiarity of gait still more markedly, for the prints of the close pairs are only 4½ inches apart, and the distance apart of the pairs is 14½ inches.

There were other footprints which we had not time to measure, but, which may prove of great interest; especially as two or more of them may possibly have been made by web-footed birds.

The Published Diagrams Should be Corrected.

A pressure of other duties has compelled me to be much briefer than the subject demands. I have endeavored to state the facts as they have appeared to my eye and to a steel tape line. I had no theory to advance in making the examination, but I could not help having convictions forced upon me which were made stronger with each new phase of the investigation. But in the first place I wish to call attention to the diagrams published under the auspices of the academy, and therefore making it responsible for the results. The work had been done with great conscientiousness, but there is nothing in the diagrams to indicate whether a footprint, especially of the so-called man, is obscure, or whether it is distinct and well marked, as in series No. 1. Now, as a matter of fact, these footprints on the lower floor are mainly very faint indications, and would most likely have left no outline from the removal of the upper and softer layer, but that there is a development of the red oxide of iron in what was the lower clay surface wherever the animal placed its feet.

Therefore, in so far as the diagram is concerned, these facts should be; as they can be, fairly and properly indicated by different depths of shading, etc.

Secondly, in the diagram of the mammoth footprints and other tracks at the southeast angle of excavation there are two matters that need rectification as misleading. First, the legend, "Impression of the Body of an Animal." Now, as a matter of fact, this is only a report that has been handed down in the history of the earlier excavations, for the floor is removed and nothing whatever is left to indicate this problematical "impression."

Thirdly, near the same place on the diagram are five round, full tracks described with others, in the text as "several confused tracks of a man and some large animal." This "large animal," referring to what made the round tracks; but these apparently different tracks were all made by the same animal, the so-called man. When this animal came to this part of the mud deposit it found itself in soft mud, into which the feet sank about four inches, apparently to hard, coarse sandstone beneath, and it possibly made a turn to avoid being bogged. One of these round tracks has had the center core of coarse sandstone removed by Mr. Bell, and the result is a display of one of the long footprints, and the others are certainly footprints of the same animal, produced at the same time, but these prints are yet all filled up. Whether this filling is from the supposed deposit of coarse sand, as in the one cleaned out, or whether from "balling" of the foot, remains to be proven. I have written to Mr. Bell, asking him to make an examination of the matter.

And here it may be suggested that in this very locality we might reasonably expect to find more important footprints and possible remains, especially if the animal became bogged in this soft mud.

The So-called Man is a Quadruped.

The question of the quadrupedal character of the footprints of the so-called man having been raised by high authority, it was a matter of interest to ascertain if there was any indication of duplication of footprints; that is, whether the hind foot was placed unsymmetrically over the back of the forefoot. I have already stated that in series No. 1 there are no two tracks which are exactly alike, and that in the line of the wolf's tracks one of the imprints of the foot of the so-called man is apparently duplicated. Other indications of duplication are to be found in the different series on the lower floor, and in more than one instance a secondary side impress on one side only of the animal is as clearly indicated as the impress itself. So marked was this in one instance that a plaster cast had been taken of the two, and I examined the original to find the smaller secondary clearly made out but the larger and inside track mostly obliterated by the wheels of carts carrying stone from the quarry.

In this light the evidence seems to me unanswerable that the so-called man was a quadruped, and it will require the wiping out of these duplications before they can be assigned to a biped.

The question of the assumed sandal of wood or of rawhide, was clearly solved in my mind as soon as I made out the existence of the two layers of mud of different stiffness and tenacity, already detailed with some minuteness in the description of the footprints of the series No. 1. Moreover, in the newly exposed footprints of the same animal, where the impress is made several inches deep in the softer soil, there is no indication whatever of a sandal. Nor in many footprints which I examined on the lower floor is there any such suggestive margin. With the palpable evidences before me, I can see no other logical deduction that that the animal was a quadruped; whether a megatheroid or a bear I leave for the paleontologists to decide. It is the solution of a mechanical problem by actual graphical demonstration.

Fragmentary Character of Tusks, Teeth and Bones.

A word more of the character of the deposits after the mud layers of the upper and lower floors had been covered by them.

The first 10 feet is composed of very sharp, small grains of sand from disintegrated quartz and other materials. It has been deposited by swiftly moving waters as indicated by the markings of the numerous deposits lying at many angles, and having been partially cut away and redeposited many times.

In this stratum are found the jaw bones heretofore described by Mr. Gibbes, pieces of elephant tusks, fragments of bone and of teeth, the tooth of an elephant, of which I furnish a drawing; and the matrices made by pine cones, and pieces of wood. All these fossil remains are fragmentary and scattered, indicating that they have been water-borne by the strongly rushing waters which brought down the sands, and that the source from whence they came was up the stream at a higher level.

[A series of diagrams to scale was used by Professor Davidson for reference as he proceeded with his report.]

MONTANA COMPARED WITH DAKOTA.—Here is what a tourist through Montana writes to his home paper: "I am certain that this great Territory, 500 miles long and 300 miles wide, contains more natural wealth than any other State or Territory in the Union. It is the least known, with perhaps the exception of Idaho; but if what has been discovered of its mineral resources is a fair standard, in a very short time all the rest of the Union will have to yield the palm to this favored section of our country. It is curious to compare the surface of Montana with that of her great neighbor, Dakota. Dakota is peculiarly a farming country, while Montana is a mining and grazing country. Dakota rolls smoothly away in gentle undulations, not unlike the swells of the ocean. From the summit of these swells the eye becomes fatigued with the sameness of the landscape. Montana, on the other hand, is adorned with majestic scenery of rock and mountain, in whose bowels are secreted every variety of metal. About one-half of the Territory is mountainous, the other half being good arable land capable of the highest cultivation, yielding abundantly agricultural products of all descriptions."

Tributes to California.

We enjoy tributes to California. There is no land more worthy of eloquence, no clime in honor of which orator and poet can more truthfully attune their praise. It is our home—the gladsome land to which we have come from all parts of the earth and proclaim the most fit abiding place. It gives us joy to find our own citizens glorifying the State, and to hear the appreciative tributes of the sojourners. Hence we give space to a few honest, earnest words about California which have been recently spoken in public places.

The Conclave of Knights Templar gave opportunity for the exercise of oratory, and naturally enough California, to which the pilgrims had come, was often the theme. We propose to cull the paragraphs bearing such comment. Ex-Governor Perkins, in welcoming the hosts, thus describes the land which received them with gladness:

California is our home, the land of our choice. We have seen its great cities spring as by the touch of a magician's rod from canvas huts and willow cabins. The wild cattle and beasts of the forest roamed at will where now run the great railroads and telegraph, and the trail of the Indian has been obliterated by the march; of civilization. These spacious bays and rivers these productive valleys, abounding with fields, orchards, vineyards and happy homes; these hills and dales, and mountains of solemn grandeur, veined with the precious ores, make it indeed a land of promise. Our valleys and hillsides, with varied and prolific soil, produce the fruit and the vine, vegetables and cereals, in such abundance that the crowned prince, the peasant and the artisan of Europe supply their tables with luxuries from our surplus store.

We point with pride to our schools, colleges, churches and benevolent institutions, as well as our increasing commerce, our growing industries, and in this line our surely coming possibilities. And of our climate—between our southern boundary, where grow the orange, the pomegranate and the vine, and our northern border, where Shasta rears his majestic summit above the clouds and, clothed in eternal ermine, reflects his sunshine to the sea—there is not a mile of latitude but that has its varied climate. The cool and invigorating breezes experienced here, and born of the breath of the Pacific, pass from its sounding shore across the valleys, warmed and softened by perennial sunshine, and finely rarified and rising it sighs itself away on the tops of the Sierras, to return again in God's good time ladened with the odor of fruits and flowers, the product of our land and the result of our toil.

Upon another occasion, Gov. George Stoneman, in welcoming the Sir Knights on the part of the State, spoke as follows:

Within the long limits of our State lines you can all find a congenial resting place. To those of you who come from the ice-bound mountain regions of old New England, we tender in exchange the pine-clad, snow-capped grand old Sierras. Should your homes be located on the prairies of the great Northwest, they can be replaced by other homes on the broad plains of the Sacramento and San Joaquin. For the harsh salt winds of the Eastern seabord we offer you the soft, balmy sea trades of the Pacific coast, and for the Atlantic ocean's roar, the thunders of the everlasting waves from the distant shores of old Cathay.

California is on the great highway of the commerce and travel of the world, midway between the East and the West, a toll house as it were for the traffic of the globe. She has had her ups and her downs, her dark days and her bright ones. Fate has frowned and Fortune has smiled. At one time engulfed by floods, at another consumed by fire; but notwithstanding all this, her growth has been steady and rapid. Fortunes have been made of fabulous extent in the short space of one generation, and palaces have been reared by nabobs and millionaires that vie with those of the world in extent, grandeur and display. In commercial circles, the reckless venturesome spirit of early days has largely given place to legitimate business methods, and where our bulls and bears a few short years ago met in daily combat, all is now quiet and serene. I am glad to observe that unlike the Knights of old, you have taken with you upon your pilgrimage the ladies fair to whom you have sworn your knightly devotion, and in the heartfelt welcome which is extended to you, let them not think themselves forgotten. If there is any one thing that California is proud of, it is its ladies—its wives, its mothers and its daughters—and that they have so cordially welcomed their sisters of all the East is but an evidence of that hospitality which we trust is second in California to that of no other State in the Union.

J. D. WALKER, of the firm of Falkner, Bell & Co., for the past two months or so has been on a visit to Scotland, on business of a special and important character. During his absence he has successfully negotiated the transfer of a large area of California timber lands, for a sum aggregating between $1,500,000 and $1,750,000, to a recently organized corporation in Scotland, known as the California Redwood Company, of which, it is understood, the firm of Falkner, Bell & Co. will be the representative agents on this coast. The purchase embraces lands, mills, tugs, embarcaderos, and other incidental accessories to the general lumber trade.

Butte and its Bullion.

Green Majors, of the Butte *Inter-Mountain*, makes the following brief statement concerning Butte and its bullion:

Butte has been known for sixteen or twenty years as a very rich placer mining camp. It is located just over the Pacific slope divide, at the extreme head of the Columbia river, and on Silver Bow creek. It now has a population of from 8,000 to 9,000, about one-third of these entering camp about two years ago. Heretofore the city has been reached from the Union Pacific by the Utah and Northern road, which entered Butte twenty months ago. In a few days its connection with St. Paul will be made. The Utah and North ru runs a narrow gauge road above Butte to its junction with the Northern Pacific, which is a few miles west of Helena.

The Mining Interests.

The city is on a gentle slope, is crowned by the Alice mine, which is about two miles from the creek, and on Butte hill. It is in Silver Bow county, and in the Summit Valley mining district. Some five or six years ago the city became known as a quartz district, and is now a huge quartz camp, with from 300 to 400 mine locations. The work going on in the mines is shown by there being about 25 steam hoists in operation. There are 4 smaller ones in operation, which have a capacity of 325 tons of ore a day, and another is now in process of erection which will have a capacity of 500 tons daily. The stamp mills are as follows:

	Stamps.
Alice	80
Lexington	40
Dexter	20
Moulton	40
Lexington, No. 2	20
Centennial	15

There are two or three smaller mills, and the Silver Bow mill of 20 stamps, which is not connected with any mine, but is known as a custom mill.

Prominent Mines.

The prominent mines are the Alice, Moulton, the French Syndicate Lexington, which in the first six months of 1883 had an output of $741,000; the Colusa, which shipped 8,000 tons of copper and silver matte last year; the Anaconda and the Lawrence, on which $2,000,000 has been spent in development, hoist and reduction works by its owners, Haggin & Tovis, of San Francisco; the Bell, which produces 100 tons of ore daily; Gagnon, National, Andy Johnson, Liquidator, Parrot, Shakespeare, Anglo-Saxon, Posa and Magna Charta. About two-thirds of the developed mines are gold and silver, and the balance copper and silver. The output for the camp this year is estimated at between $6,000,000 and $8,000,000. This is composed of gold and silver bullion, and copper and silver matte. The ore and matte are at present being shipped to Omaha, Denver, Chicago, Baltimore and Europe.

The Veins and Smelters.

The point of excellence in the mines is that they are on true fissure veins, six in number, and many experts state that the ore is good for 100 years' supply. In the silver ore the gold is found; in the copper, silver ore is found. The copper ore paye to work, even when the market is down, as the silver extracted pays for the labor.

The trouble there is to get the ore reduced. All the stamps connected with the mines are kept busy with their own output, and thousands of tons of ore are awaiting the custom mill. On the Pacific coast, ore of $5 and $6 a ton is worked; but in Butte, ore worth $25 a ton is throwu on the dump as too low a grade to be handled. Some of the rich mines handle low-grade ore by condenssrs and water, using Cornish rollers to bring out the quartz. These little bits of machinery, including smelters and stamps, cost $100,000 or more, and the mine owners are too poor to build them, and thus would like Eastern capital to put up custom stamps and smelters, as the price now charged and scarcity of apparatus makes it ruinous to them. The fuel is not very plenty in Butte at present, but a fourteen-mile flume has been built to bring it down. The coal is at present brought from Wyoming and Utah, and the Yellowstone valley is now developing some mines.

In the city there are five churches, schools to seat 500 pupils, and a new one, to cost $5,000, is to be built. A court-house to cost $125,000 is now under way. A complete water works furnishes good water and strong pressure. The county is the smallest in the Territory, but its tax list is the largest, and showed last year property to the value of $5,600,000. In the surrounding county are a number of camps, such as Basin, Wickes, Iron Mountain, Silver Star, Gleudals, etc.

LONG RAILS.—It is said that the Philadelphia and Reading Railroad Company proposes hereafter to use on their roads rails 60 feet long, instead of 30, and will begin their manufacture at once. The rails will also be increased in weight from 68 to 70 pounds per yard. The decreased number of joints to cars for will lessen expenses, it is thought; but there are difficulties in the way of handling and transporting the 60-foot rails, which trackmen will understand.

GEORGE REVETT has been appointed Superintendent of the South Pacific Coast Railroad, vice A. H. Fracker, whose resignation takes effect October 1st.

USEFUL INFORMATION.

How Perfume is Extracted.

One of the best methods of obtaining perfumes is by the use of grease. The process is called maceration. The best fat employed is marrow, which is melted in a water bath and strained. While it is still warm the flowers are thrown in and left to digest for several hours. They are then taken out, and fresh ones are placed in the grease. This is continued for several days. The grease and perfume are then separated by the use of of alcohol. Beef marrow is not the only substance used in extracting the odors from the flowers. Inodorous oils are also used, especially refined olive oil, which is more extensively employed in the south of Europe. The process used for delicate plants, such as jessamine, tuberose and cassia, which will not allow the use of heat, is on the principle of absorption. A layer of purified lard and such mixture is spreal on the glass bottom of a square wooden box, and upon this freshly gathered flowers are spread every morning as long as the flower is in bloom. The boxes are kept shut, and the grease soon acquires a very strong odor. In saturating oil, instead of glass bottoms to the boxes, wire ones are used, upon which cloths soaked in oil are laid, and the boxes or frames are piled upon each other to keep them close. After ths oil soaked cloths are sufficiently charged with ths perfume, they are placed in a press and the oil squeezed out.

Tar as Fuel.

M. Le Treust gives some data relating to the use of tar as fuel in the Vangirard Gas Works, the model followed being that of the tar furnaces of the gas works at Breme, designed by M. Servier. M. Le Treust mentions the disadvantages usually accompanying the use of tar as fuel, including the rapid destruction of the retorts, the extreme care necessary to maintain a regular flow of tar, and the liability to smoke. All these inconveniences are claimed to have been overcome by the arrangements perfected by M. Le Treust, which consist of a special form of injector, working in a furnace to which the air supply is regulated to a constant quantity. To insure fluidity, the tar used is taken directly from the hydraulic main. In order to utilize the great radiant power of the burning tar, the retorts of the setting of six are left as bare of brickwork as possible, being supported only on three narrow arches in their length, the middle of the setting being left void. Finally, the front wall is kept cool by the passage through it of the air required to support combustion. Eight settings of six retorts, working for a psriod of 434 days, carbonized 19,259,200 kilos. of coal, and consumed 2,345,750 kilos. of tar; being 675 kilos. of fusl per bench per day, or 12.17 kilos. of tar per 100 kilos. of coal carbonized. From these figures M. Le Treust concludes that tar firing is as good as coke, since ths production of gas is as large, the retorts last as long, and ths consumption of fuel is only 12 per cent of the weight of coal carbonized.

RAINBOW COLORS.—Rainbow colors are produced on brass ornaments, such as clasps, buttons and buckles, by stringing them on a copper wire and dipping them in a bath of plumbate of soda freshly prepared by boiling litharge in caustic soda aud pouring it into a porcslain dish. A linen bag of finely pulverized litharge or hydrated oxide of lead is suspended in ths solution, so as to keep up ths original strength of the solution. While the articles are in this solution, thsy are touched one after the other with a platinum wire connected with the positive pole of a battery until the desired color appears. The galvanic current employed must not be too strong. The colors are more brilliant if they are heated after they have been rinsed and dried. Colored films are more conveniently produced upon a bright brass by different chemicals, by painting with them or hy immersion. For example: golden yellow, hy dipping in a perfectly nsutral solution of acetate of copper; dull grayish gresn, by repeatedly painting with very dilute solution of chloride of copper; purple, by heating them hot and rubbing over with a tuft of cotton saturated with chloride of antimony; golden red, by the uee of a paste made of four parts of prepared chalk and one of mosaic gold.

PEANUT FLOUR.—The valne of the peanut crop of this country for the current year is estimated by the Savannah *Telegram* at $3,000,000. That paper saye tbat "the Virginians are beginning to turn the peanut into flour, aud say it makes a peculiarly palatable 'biscuit.' In Georgia there is a custom, now growing old, of grinding or pounding the shelled peanuts and turning them into pastry, which has some resemblancs, both in looks and taste, to that made of cocoanut, but ths peanut pastry is more oily and richer, and, we tbink, healthier and hetter every way."

HORN FROM SEA WEED.—Under the generic term, "sea weed," the sea beachee offer to use as fertilizers a numbsr of distinct vegetable productions, and two of them, at least, are recognized as materials for food. The *Rhodomenia palmata*, or dulse, is frequently sold on the streets of our seaside cities, taking the place of the school girl's chewiug gum, while the *Chondus crispus*, known commercially as "Irish moss," is a favorite for the preparation of jellies and blauc mange. Now, it is claimed, that by experimeut the *Zostera marina*, or "wrack," can be made to yield, by treatment with mineral acids, a substance resembling horu, capable of being manufactured into forms, and of receiving color from pigments. This substance is called "algin," from *alga*, the generic name of one common species of sea weed. The crude material can be obtained in large quantities on all exposed shores, and its preparation for ultimate manufacture is a cheap process.

THE following is clipped from the catalogue of a well-known emery-wheel manufacturer: "We lately asked a prominent manufacturer (too critical to be easily suited) what he really did want. 'We want,' said he, 'a wheel to cut like thunder and last forever.' Now bear in mind that you can't have both. You must choose. If you want a wheel to 'cut like thunder,' you must have a soft wheel which will cut freely and create little heat, but which will wear out fast. If you want one to 'last forever,' then you must have a very hard one, and that will cut slowly, will have to be forced hard against the work, and may create heat enough to case harden your saw or other work."

PRESERVING AND WATERPROOFING FABRICS.—Piron deserihes in the *Moniteur Industrielle* a new process for rendering paper or cloth waterproof, and at the same time protecting it from change. He employs an alcoholic solution of the agreeable oil used to perfume Russia leather, and which is obtained by distilling white birch bark. The oil dissolves readily in alcohol, but is no longer soluble after it bas once dried and became oxidized to a resin. The thin film of resin formed by impregnating the fabric does not detract from its pliability in the least, and its aromatic odor protects it from insects. It protects quite well sea water, acids, and moderate changes of temperature.

ANOTHER process of imprsgnating wood for its preservation has been patented in Germany. This consists in first treating the wood with a solution of zinc vitriol, and then with a solution of chloride of calcium, so that the preservative coating is formed upon the wood hy ths chemical action of both substances upon one another.

AN imitation of ground glass can be produced hy dissolving two tablespoonfuls of Epsom salts in a pint of lager beer, and paintng the glass with the mixture. When dry the glass will appear as if frosted.

GOOD HEALTH.

The Medicaments of Brutes.

In a communication to the Biological Society of London recently sent by M. Delaunay, on the medical practice of animals, the doctor gave some interesting facts, from which he argued that the human reason ought to be trusted as much as animal instinct in many instances where medical science seems to be a fault; and he insists that the desire of sick persons for certain foods and drinks may be a natural instinct rather than a morbid fancy.

But he does not state how the one may not be mistaksn for the other. In his list of examples of medical instinct in the lower animals, M. Delaunay, says that animals bathe for cleanliness and health, that they get rid of their parasites by using dust, mud, clay, etc. Those suffering from fever restrict their diet, keep quiet, seek darkness and airy places, drink water, and sometimes plunge into it.

When a dog has lost his appetite, it eats that species of grass known as dog's grass (*dogtooth*), which acts as emetic and purgative. Cats also eat grass. Sheep and cows, when ill, seek out certain herbs. An animal suffering from chronic rheumatism always keaps, as far as possihle, in the suu. If a chimpanzee be wonnded, it stops the bleeding by placing its hand on the wound, or dressing it with leaves and grass. When an animal has a wounded leg or arm hanging on, it completes the amputation by means of its teeth. A dog, on being stung in the muzzle hy a viper, was observed to plunge its head repeatedly for several days into rnuning water. This animal eventually recovered.

A sporting dog was run over by a carriage; during three weeks in winter it remained lying in a brook, where its feed was taken it. The animal eventually recovered. A terrier hurt its right eye; it remained lying under a counter, avoiding light and heat, althongh it habitually kept close to the fire. It adopted a general treatmsnt, rest and abstinence from food.

The local treatment consisted in licking the upper surface of the paw, which it applied to the wounded eye, agaiu licking the paw when it became dry.

The doctor thinks that veterinary medicine, and perhaps human medicine, can gather from these facts uscful indications, precisely bccause they are prompted by instinct.

Milk Diet in Bright's Disease.

Since we know not at present any drug that possesses therapeutic value to any marksd extent in this terrible and fatal diseaso, and since it is daily making sad havoc among human being, and prineipally among that class who, by reason of their valuable public labors, are particularly necessary to the welfare of the world, therefore it becomes a medical question of paramount interest that we should discover some poteut method of combating this very prevalent disease. Some years since, Carel first called attention to the treatment of Bright's disease by the use of milk diet, and since then Duncau, as well as many other prominent physicians, have written on this subject. We have ourselves seen some remarkable results follow this treatment, while Dr. S. Weir Mitchell, of our city, is now quite an enthusiast on this subject. This method of treating a formidable disease has received sufficient distinguished indorsement to recommend it seriously to our notice. We would, therefore, ask all physicians who read this article to try this method of treatment, and to furnish us with their experienec, which we will publish. The milk is used thoroughly skimmed and entirely freed from butter. To procure the best results, it has been advised that the patient shall restrict himself absolutely to milk, and continue the treatment for a long time. If it disagrees with the stomach (as it will in some cases), Dr. Mitchell advises that the patient be put to bed, and the treatment commenced with tablespoonful doses, to which lime water is added until the stomach tolerates the milk, when from eight to ten pints daily should be taken, and absolutely nothing else. The sanction of such a distinguished physician as Dr. Mitchell forces us to seriously consider the merits of this treatmeut, and we trust to receive the experience of all readers of this journal who may have cases of Bright's disease to trsat. —*Medical and Surgical Reporter.*

POISONOUS MAPLE SYRUP.—The commou practiee of using galvanized iron pans for boiling maple syrup is by no means so free from danger as has been supposed. At the last meeting of the Ohio Mechanic's Institute, a paper was read by a chemist, in which a case was cited which clearly proves the dangerous character of zinc when used for such a purpose. As is well known, galvanized iron is simply sheet iron covered with zinc. If the sap is perfectly sweet, it will corrode the zinc but little; but if it has become a little sour by standing too long before being boiled, a very considerable amount of zinc may be dissolved; in one reported case amounting to nearly an ounce of zinc sulphate to the gallon of syrup. This is the cause of the metallic taste which many persons who use maple syrup freely must have frequently noticed. A considerable quantity may be present, however, without being detected by the taste. Until some better means of condensing the sap is found and adopted than the galvanized iron vessels now in use, we would advise those who are particular as to the quality of what goes into their stomachs to avoid the use of maple syrup, unless they know that it is not contaminated with zinc.

IT SEEMS to be a well recognized fact that human beings cannot exist in a state of health on animal food exclusively for any great length of time. Vegetables are necessary to prevent certain diseases, and to remove those diseases when they have invaded the system. But vegetables can be used as an exclusive dict and yet maintain the body in a state of perfect health. Herodotus implicitly attributes the activity and healthiness of the Persians of his time to the variety and abundance of fruit and vegetables which they consumed. They had at meals not only several dishes, but several courees of vegetablo food preceding a very moderate allowance of solid meat. Chambers says: "I feel sure that tho puniness, infertility, pallor, fetid breath and bad teeth which distinguish some of our town populations, is to a great extent due to their inability to get these articles of the table fresh.—*Cor. Sanitarium.*

WARTS.—Are warts caused by impure blood? and what is the best way to remove them? How about charming them off? In answer to the above the *Herald of Health* says: Warts are not caused by impure blood, but many exist in otherwise healthy persons. There are many waye of curing them. Perhaps as good an one as any is to touch them daily with strong acetic acid. Be carcful not to let the surrounding skin he touched, however. You wish to know if warts can be charmed away, and if so, how? Warts often disappear suddenly and from no apparent cause. Had the owner charmed them he would have believed this was the cause of the fright. They may disappear after "charming," and one method is just as good as another. Warts may be strangled by tying a tight ligature round the base of each.

TEMPERATURE OF A BATH.—The proper temperature for a bath is the oue which feels agreeable and comfortable, and not the one that feels hot or cold. Of course these may be necessary in certain cases. As a rule a bath may last as long as it is agreeable. This may be one minute, five minutes, or longer. Those who have accustomed themselves to hot baths may lower the temperature gradually and soon accustom themselves to a cold or cool bath.—*Herald of Health.*

VEGETARIANISM AND GOUT.—An old English doctor reports that he has nsver been successful in the treatment of gout, except in cases in which he required total abstiuence from animal food, as well as from wine.

DIPHTHERIA.—It is said that decaying cabbage will produce diphtheria sooner than any other nuisance about the house.

Passing Events.

The fair season has been inangurated by the opening this week of the two more important ones, the State Fair at Sacramento, and the Mechanics' Institute in this city.

The driving of the last spike on the Northern Pacific railway is an event of great importance. It was done with appropriate ceremonies, and completes the third great transcontineutal railway. To the northwest this road will bring thousands of settlers, and huild up cities and towns, so that an immense region will be brought into cultivation, and into commercial intercourse with the rest of the world.

Mining news of importance is rather scant. Winter will soon drive the prospectors indoors in the mountain regions, though in the milder climate prospecting will continue for weeks to come.

RAILROAD MEETING.—There will he a great gathering of railroad men in this city on the 20th inst. The object is a convention to make certain "fare" arrangements. The railroads which will be represented are the Union Pacific; Central Pacific; Southern Pacific; Galvestou; Harrishurg and San Antonio; Atchiuson, Topeka and Santa Fe; Missouri Pacific; Texas Pacific; Atlantic and Pacific; Northern Pacific (Villard) and Denver and Rio Grande. Besides these roads a great many branch lines will be represented. The meeting will be the most important of its kind ever held on this coast.

Electricity, Cables or Horses?

There will shortly be an opportunity in this city for a very interesting comparative test as to the relative merits of systems of street car propulsion. The line which runs through the city on Mission street is ahout to adopt electricity as a mtor, using storage batteries placed under the seats in the cars. On a parallel street one block away with almost precisely the same grade, runs a new road on the underground cahle system, having all the newest appliances and best equipment possible to procure. No expense has been spared in the construction of the road or its outfit, and it may be said to be a model in this respect. It runs at a higher speed than any other cahle road in the city, and has heavy cars and dummies. Being the principal thoroughfare of the city and in a thickly settled portion, the cars carry heavy loads, especially in the mornings and evenings.

The Mission street road, like that on Market, runs from the ferries out to the ontskirts of the city. It runs one-horse cars at present, and no doubt its patronage has fallen off since more rapid communication has heen made by the other road, which is only a hlock off. It will now try the experiment of electricity in place of horse-flesh. The system is no experiment, so far as practicability is concerned. The question of expense is the only one to solve. And it is this that is of the greatest interest. Can we run cars cheapest by the cable or the electric system?

It has been found by experience that the eable system of operating street railroads costs much less than when tbey are run by horses, and the capacity may he increased at any time very readily. There is greater speed, better accommodation for passengers, and an improvement of the traffic in every way. In these respects it is hardly probable that electricity will excel the cahles. If, however, it ean cheaper still more the operating expenses a very great point will have been gained.

San Francisco was the first to introdnce and bring to perfection the cable system of operating street railroads; and now there are a number of successful lines running, others heing constructed, and still others planned. Eastern and European cities, profiting by our example, are introducing these roads.

We will now be ahle to show to the world the relative merits of the three systems. On three parallel streets with abont the same grades—all nearly level—will be the three systems. On Howard street are ordinary horse cars; one hlock away will be the cars run hy electricity, and one hlock from that the cable cars. The roads are of nearly the same length and have the same class of traffic. There will be an excellent opportunity to get the practical experience the world needs on the questions of street car propulsion, and we shall look forward with interest to the time when these results will he forthcoming.

Opening of the Mechanics' Fair.

On Tuesday last, the eighteenth annual exhibition of the Mechanics' Institute was formally opened in this city. The formal opening exercises were held at the Grand Opera House at two o'clock in the afternoon. Schultz' band was in attendance and furnished the music. The Rev. James Matthews delivered the opening prayer, and was followed by A. W. Starbird, Vice-President, who, in the absence of President Cornwall, delivered the opening address. The oration was hy the Rev. Robt. McKenzie, on the subject, "Tools and the Man," from which we shall quote on another occasion.

In the evening the exhibition building was opened. Though, as usual, there are many vacant spaces, all are now heing rapidly filled up. Mr. Culver, the Secretary, thinks that in variety of exhibits the fair excels former ones. The machinery department is entirely separate, so that the noise of the moving mechanism is not noticed in the main building. The mechanical display is somewhat larger than usual. Many changes have been made in the general arrangement. The decorations are well spoken of, and there are two aisles instead of one on the main floor. The art display is creditahle; and the garden is quite attractive. The fair is run in good order, and there are many more things worthy of examination.

Curve of Quartz-Mill Cams.

The proper curve of the face of a cam in a quartz mill, in order that it may perform the desired duty with the least friction, is the involute of a circle the radius of which is equal to the distance between the center of the cam shaft and the center of the stamp stem. This produces a line for the face of the cam which meets better than any other the various requirements. The bottom of the tappet is constantly perpendicular to the radius of the curve of the cam. The tappet, and with it the stamp, is lifted vertically and uniformly, so that the lift of the stamp is always regularly proportioned to the revolution of the cam shaft. The cam curve may be constructed on paper, by means of tangents, but in practice the line of curvature is produced by cutting from a thin hoard a circular piece the radius of which is equal to the horizontal distance from the center of the cam shaft to the center of the stamp stem. At a given point on the periphery of the circular piece is fixed one end of a thread, which must have the length of the greatest desired lift of the stamp, and to the other end of which is attached a pencil point. The circular piece, with the attached thread wound on the periphery of the circle, is laid on a smootb board on which the line is to he traced, and the thread, heing constantly stretched to its furthest reach, is unwound until it forms a tangent to the circle, at the point where the other end is attached. The line described hy the pencil point is the desired curve. Some builders slightly modify this curve, giving to the cam arm a greater curvature near each of its ends, in order that the cam in its revolution may come in contact with the tappet at the least practicahle distance from the cam shaft, where the concussion is less than at a greater distance, and to diminish the friction between the extremes of the cam and the face of the tappet. The face of the cam is 2 or 2½ inches wide. Its extreme end is fashioned so as to correspond to the onter edge of the tappet, which is circular. The cam is placed as near the stamp stem as practicable without coming in contact with it.

Lower California Gold Mines.

We learn from Guaymas that the gold mines in Lower California are still giving favorahle returns. Parties are daily arriving in that part from the States, mostly from Tucson, bound for the placers. Not long since Mr. Harry Emeric from this city with a dry washer went to Guaymas en route for the mines. Luis Garcia, of that city, is said to have heen taking out as much as $50 per diem, and in one week made $7,000. Ten dollars a day is confidently expected hy all those going down. The line of travel is either hy sea or rail to Guaymas, then by schooner to Trinidad bay, and then a tramp or mule ride of 120 miles across rough country. Of provisions there are none, and those venturing to the placers should take at least a three months' supply. The summer has heen exceedingly hot along the Sonora coast as well as in Lower California, which has deterred many from embarking in a gold rush; hut with the approach of the cold weather a veritahle gold excitement is expected. We have before spoken of the many disadvantages of this region.

Placer County Notes.

In Placer county, just at present, there is no hydraulic mining going on, and mining matters are not very brisk. The Gold Blossom mine is being worked as usual, and is paying well. The Belmont is sinking a shaft and running drifts. The Morning Star is taking out and crushing ore that is paying from $17 to $20. There is a large body of that grade of ore at the depth of 300 feet. This is one of the most promising mines in the region. The Mayflower (drift and hydranlic), at Forest Hill, has a fine hody of cement gravel at their shaft, where they are putting up hoisting works. The mine is now being worked by the drifting process. At the Succor Flat drift mine, near Iowa Hill, they have just completed sinking an air shaft 320 feet deep, by which means they will be enabled to put a large force of men at work, and take out a large amount of gravel. With only four men, they have averaged four ounces a day. The mine is a very good one. The tunnel is in 2,000 feet. These points we obtained in a conversation this week with Mr. R. L. Dunn of Auhurn.

Running Gear of Amalgamating Pans.

It has been found that, on account of the yoke being attached to the top of the shaft, and hanging to it with the weight of the muller in an amalgamating pan, the shaft bears with great friction upon the upper part of the cone and soon wears itself so much that it no longer forms a good bearing. In order to remedy this, it is usual to pour into the journal around the shaft enough babbitt metal to form a bearing surface for the shaft, and thus protect it from wear. The objection to this is that the babbitt metal wears very soon, and it is quite an operation to remove it in order to pour in more. The charge in the pan is liable to run over and the quicksilver gets upon the babbitt and causes it to wear very fast. To remove the babbitt the gear below has to be taken off and the shaft removed. The babbitt is then chipped out with considerable labor, and the parts put together again and more babbitt poured aronnd the shaft, which takes up time. If the shaft is at all worn, the babbitt holds it so tight that it cannot easily he raised up, and much labor may be required to move the cone itself.

Charles Gracey, of Contention, Cochise Co., Arizona, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a new means of constructing the journals or hearings of the operating shafts in amalgamating pans, designed to overcome these objections. It consists in providing an adjustahle and removable gib fitted within the central hollow stationary pillar, called the "pan cone," at points of wear, and forming a suitable bearing for the upright revolving shaft operating the muller. The object is to provide a hearing which when worn may be adjusted or removed for the substitution of a new one, whereby the shaft may be kept steady and he preserved, being at the same time easily removable.

In the ordinary construction of an amalgamating pan a yoke connects the muller with the vertical shaft, which passes down through the bottom of the pan and carries a gear. This meshes with another gear on a horizontal driving shaft, motion heing thus transmitted to the muller. The upright shaft passes through a hollow central pillar, usually denominated the pan cone, which forms a journal or bearing for the shaft. In the top of this cone Mr. Gracey provides a recess in its inner side, extending down a short distance, and with this is fitted a gib, the inner surface of which continues that of the cone and forms a bearing surface for the shaft. It is made of any suitable metal—preferahly brass or babbitt—and is easily removable. When it wears above, as it is likely to do first, it may be adjusted by raising it higher, so as to present a new and narrow bearing surface. This gib, while preserving the shaft from wear, will allow its ready removal when necessary, simply by its own removal. When worn out this gib may be taken out and changed. It may be placed at any point above the shaft. Mr. Gracey has found by experience that the greater portion if not all of its wear occurs on that side of the bearing towards which the muller and vertical shaft revolve, and between points about ten degrees removed from the line of the horizontal driving shaft. Therefore there will be need of only one gib, and that placed a little to one side of the line of the horizontal shaft, and on the side towards which the vertical shaft revolves, as it will be found that almost all the wear is at this place. Babbitt metal may be poured in aronnd the shaft in other places, and thus the shaft may be preserved.

THE oyster dealers of New York City propose to pool their issues and organize an exchange, just as the produce merchants and stockbrokers. The oyster trade is going up so tremendously that it will be necessary to unite in order to protect it. Oyster men now do a heavy business in furnishing oysters for European markets. It has all grown up within the last five years.

FROM a recent investigation into the mortality referable to alcohol, conducted by a committee of the Narveian Society, it appears that the rate in London is fourteen per cent of the total number of deaths in the adult population. About twice as many occur among men as among women.

THE Central Pacific Railroad Company is erecting a water-tank at Winnemucca, Nevada, that will hold 52,000 gallons.

Blasting in Mines—No. 8.

Force Required to Cause Disruption.

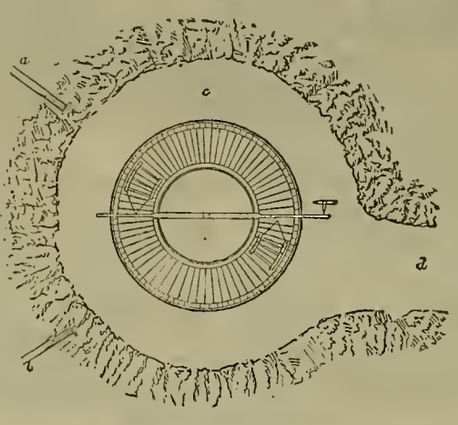
When the line of least resistance is known, it remains to determine the quantity of the explosive compound required to overcome the resistance along that line. This matter is also one of great importance, for not only is all excess waste, but this waste will be expended in doing mischief. In mining operations, the dislodged rock is violently projected to the injury of the sides of the heading or the shaft, and the air is fouled in an unnecessary degree, and in quarrying stones are shattered which it is desirable to extract in a round state. Of course, it is not possible so to proportion a charge to the resistance that the rock shall be just lifted out and no more, because neither the force developed by the charge nor the value of the resistance can be known with precision. But a sufficient approximation may be easily arrived at to enable us to avoid the loud report that is indicative of what may be called "superfluous" waste. The lavish expenditure of powder which is everywhere made does no honor to the mining engineering profession, and it becomes all interested to direct attention to this matter.

The common miner, or quarryman, acting in accordance with his rule of thumb, fills his bore-hole up to a certain height with the explosive substance, and this condition must be fulfilled irrespective of the diameter of the hole, the nature of the rock, or the length of the line of least resistance, along which the rock will be fractured. More than this, the rule must be followed irrespective of the strength of the explosive, for not unfrequently dynamite, even, is made to fill the same portion of the hole as gunpowder. This source of waste claims immediate attention, and opens a wide field to economy.

Charges of powder of uniform strength produce effects varying with their weight; that is, a double charge will move a double mass. And as homogeneous masses vary as the cube of any similar line within them, the general rule is established that charges of powder capable of producing similar results are to each other as the cubes of the lines of least resistance. Hence, when the charge requisite to produce a given effect in a particular substance has been determined by experiment, that necessary to produce a like effect in a given mass of the same substance may be readily determined. As the substances to be acted upon are various, and differ in tenacity in different localities, and as, moreover, the quality of the powder may vary considerably, it will be necessary, in undertaking mining operations, to make experiments in order to determine the constant which should be employed in calculating the charges.

One pound of gunpowder of average specific gravity occupies, when loosely poured out, about 30 cubic inches, and one cubic foot will thus weigh 57½ lbs. Consequently, a hole one inch in diameter will contain 0.416 oz. for every inch of depth. Hence, to find the weight of powder to an inch of depth in any given hole, we have only to multiply 0.416 oz. by the square of the diameter of the hole in inches, and in this way we may determine, either the length of the hole for a given charge, or the charge in a given space. The following table will be found of practical value. We take it from Andre's "Coal Mining:"

Diameter of the hole.	Powder contained in an in. of length.	Powder contained in 1 ft. of length.	Depth of hole to contain	
			1 lb. of Powder.	1 lb. of Powder.
In.	Oz.	lb. Oz.	In.	In.
1	0.416	0 4.992	9.615	38.461
1¼	0.650	0 7.800	6.153	24.615
1½	0.936	0 11.232	4.273	17.094
1⅝	1.274	0 15.288	3.139	12.558
2	1.664	1 3.968	2.403	9.615
2¼	2.115	1 9.380	1.891	7.565
2½	2.600	1 15.200	1.534	6.153
2⅝	3.175	2 6.100	1.259	5.039
3	3.744	2 12.928	1.068	4.273
3¼	4.394	3 4.728	0.910	3.641
3½	5.096	3 13.152	0.784	3.139
3⅝	5.850	4 6.200	0.683	2.735
4	6.656	4 15.872	0.600	2.403



Blasting holes are never bored truly circular; but the variations of the quantity, as determined by the table, due to this circumstance, are of no practical importance.

THE San Benito *Advance* has it from good authority that the New Idria quicksilver mine, which has been successfully worked for twenty-three years, is now not yielding enough to pay expenses. The mine is running behind about $3,000 per month, and will probably be shut down before long.

Working Gold-bearing Clays.

Special improvements have to be devised for treating gold-bearing clays, and these are known as puddling machines. The original and most simple form is the puddling box, a rough wooden box into which the clay is thrown, mixed with water, and then thoroughly stirred. The thin mud is drawn off near the bottom, and more water is admitted, when the stirring is repeated. Where operations are more extended, an upright shaft furnished with strong arms is placed in the center of the tub and set in motion by a miter-wheel driven by horse or steam power. In this State puddling is seldom resorted to, because there is generally a head of water to hydraulic with, the water force breaking up the clay.

In Australia, where water is not plentiful, the puddling machine is in common use. The form is shown in the engraving on this page. It consists of a circular space whose sides and bottom are covered with hard wood or iron, and in the center of which revolves a perpendicular shaft, worked by horse-power. From the cross-beam on the shaft depend two harrows, which are dragged around the circle, and puddle the dirt on their way. Sufficient water must of course be constantly supplied. The gold and sandy matter collect at the bottom of the circle, and are removed at intervals and panned out: *a* is the water-supply drain; *b* discharge drain; *c* horse walk; *d* roadway. Occasionally steam is used in place of horse-power. On one occasion, cited by Locke in his Treatise on

HORSE POWER PUDDLING MACHINE.

Gold, from which we take these facts, a considerable quantity of silt was taken out of a sludge-drain, and subjected to crushing and amalgamation. It yielded an average of nearly two pennyweights per ton, which was considered by competent authorities to represent about the average loss from puddling machines, and at Sandhurst an indication of the richness of the dirt.

THE DEBRIS SUIT.—The Woodruff-North Bloomfield debris suit has been set for the 24th inst. The case will be heard by Judges Sawyer and Deady sitting in bank. The testimony which was taken before Messrs. Clement Bennett and I. H. W. Riley, special examiners, will be filed by the 20th, and will amount to about 12,500 pages. The testimony, instead of being written out in longhand, as is usually done by shorthand reporters, has been transcribed on the caligraph, which makes three copies and is much easier to read than manuscript. The examiners have been sitting from the 1st of June until the 7th of September. George Cadwalader of Sacramento and I. S. Belcher of Marysville have been present throughout the examination for the plaintiff; and William M. Stewart, James K. Byrne and W. C. Belcher represented the defense. The Anti-Debris Association of the Sacramento valley was represented by S. W. Sexey, their President. L. L. Robinson, President of the Miners' Association, also represented the defendant. The case will probably take a month to argue.

THE mines in Big and Little Cottonwood are doing better than in the past six years. A large amount of rich ore is coming down daily.

NEW YORK CITY has a population of 1,300,000. There are but 61,052 persons who own real estate in the city.

Pocket Mining.

Written for the PRESS by CHAS. S. LANG.]

The term "pocket" mine is frequently used as a term of reproach most often by parties who have large (and occasionally barren) ledges which they desire to sell, against small or narrow veins in which the gold forms in rich bunches or "pockets." It is safe to say, however, that more gold has been produced from pocket mines at less expense than from all the regular pay or milling veins in the State. A pocket mine requires no expensive machinery and no mill, because the pay ore or pocket when found is often so rich that it can be profitably crushed in a large hand mortar, there being often more gold than quartz. Pocket mines are sometimes found in the same neighborhood and in close proximity to regular pay or milling ledges. Generally speaking, pocket veins dip towards the West and are seldom more than six inches in width, sometimes not thicker than the blade of a case knife. They are frequently branches or feeders to larger milling veins, but sometimes intersect large "blow outs" of perfectly barren quartz, and are also found running parallel with large barren veins, this being the general rule in Tuolumne where this class of mining seems to be best understood. To be a successful pocket miner requires absolute familiarity with the "pocket slate," and close powers of observation, united with enterprise and perseverance. A few brains are good, but not too much; if there is any excess it should be of muscle.

Pocket veins always occur in slate, or properly, schists, or in contacts of slate and other formations, and the gold is always found upon a certain reef or "crossing" of "pocket" or mineral slate, as it is usually termed. Outside of this peculiar kind of "slate" the vein is invariably barren; thus it will be seen that the kind of slate or schist through which the vein cleaves its way is the key to successful pocket mining. The looks of the quartz is of no consequence. Any kind of quartz is pretty that is liberally mixed with gold, and no matter how lively or ribbon-like the quartz, unless associated with the proper slate, it will never "make pay;" while, on the other hand, the hungriest looking, long grained, glassy "bull rock," nay, mule quartz, will turn to nearly all gold under proper and favorable conditions.

Pocket or "mineral" slate is generally filled with iron pyrites, on the surface oxydized into mere rusty specks, but deeper down, showing their cubical form, sometimes there are no pyrites in the slate, but in that case it is streaked with iron, breaks with a glistening crystalline fracture and seems to be mixed with quartz. Pockets are usually sought and found at the head of gulches which have produced coarse gold nuggets. The first thing to be observed is the character of the slate when a reef or "crossing" of pocket slate is found. The surface dirt is panned and the "prospect" followed until it runs out by going up the hill. There is no cause for discouragement, even if no quartz is found in the pan, because a "marker" of clay is often all that the ledge consists on the surface. The ledge or stratum once found, it is panned lengthwise until the prospect weakens. The point which shows the coarsest particles or greatest amount of fine gold is the proper place to sink. The pan must be always brought into play, and the gold followed, no matter what course it may take. The best miners always pan at least once for every foot sunk or drove. Quite often the "fuse," "line," or pay chute proper, shows nothing but fine colors in the pan; at the next pick stroke perhaps several dollars are obtained, and in less than a foot more the quartz may be filled with gold through the entire thickness of the vein, it being sometimes in the form of a solid sheet "froze" tight against the slate, requiring a chisel or pinch bar for its removal. These cases are not so rare as one might think. Acute observation is needed. It has happened that inexperienced or careless miners have thrown thousands of dollars on their waste dumps. At first sight one might imagine pocket hunting to be all guess work, but it is governed by the same rules that are followed in working milling veins. The only difference between a milling chute and a pocket chute is, that while the milling chute may be 50, or 100, or 300 feet long, as the case may be, a pocket chute is seldom if ever more than ten feet in length, and sometimes not as many inches.

In the milling vein the gold is diffused regularly through a long mass of quartz; in the pocket chute the gold is concentrated in a small space and forms in rich bunches occurring one after another at irregular distances, generally from 10 to 20 feet apart and most always on a line; a prospect sometimes of not more than a few colors to the pan continuing below one pocket and leading to another; occasionally these prospects are followed for 50 feet or more before the vein "bunches" and "throws pay" again. It is a rule in pocket mining that all chutes come to the surface, and unless a "prospect" or colors of gold can be obtained by panning the surface and quartz it is useless to sink, no matter how inviting the appearance of the slate. But when gold is found, even though in infinitesimal quantity, but associated with mineral slate, the chances are favorable, and a hole three feet deep may be enough to show thousands of dollars. Some of the richest pockets have been found almost on the surface. Thirty thousand dollars was taken out some years ago near Sonora, not over six feet down. One piece, nearly all gold, weighing 18 ounces was found sticking up above the bottom of an old abandoned reservoir dug in early days by Mexicans to hold water for ground sluicing; the reservoir banks were then tested, and over $3,000 panned out from the banks. The reservoir had been dug right on top of a surface pocket, and the quartz being of a dirty brownish black color was not supposed to contain anything. This vein was followed down nearly a hundred feet and yielded other pockets.

For no intelligent reason pocket miners formerly thought that pocket mines gave out at from 70 to 100 feet in depth, but since the discovery of the Bray, Clark and Divoll pocket in the limits of the town of Sonora at a depth of about 300 feet, this opinion is not so generally held. Nine hundred pounds of gold were shipped to San Francisco from this pocket at one shipment, as the books in Wells-Fargo's office show. How much has come out altogether no one knows; the mine for some reason or other was worked very secretly. It is generally supposed that over a million dollars were divided between the three owners.

Some large pockets have been extracted from ledges in Mariposa county, also in Calaveras, Amador, Nevada, El Dorado, Placer, and as far north as Siskiyou.

There are more than a hundred men in this county who follow pocket mining exclusively for a business. Most all of them are in good circumstances, and some are wealthy. It will pay for miners to study this kind of mining. Many claims are doubtless being worked for milling claims at a loss, while if they were worked for pockets only they might pay big. All pocket veins do not pay to work in a hand mortar. Sometimes large pockets of milling ore are formed, but the same rules apply to both.

Quartz Mill Screens.

The screen forms a very important feature in the milling of quartz, as upon it depends the size to which the rock is reduced. The screen for working ores by the wet process is generally made of Russia sheet iron. This iron has a glossy, smooth surface, and should be free from rust or flaws, and be very soft and tough. The usual test of sheet iron consists in hammering a part of the sheet into a concave form. In the manufacture of this kind of screens the sheet is perforated by punches varying in size from the number 0 to the number 10 common sewing needle.

Screens are also made of pure brass wire cloth, having from 40 to 60 meshes to the lineal inch. For dry ores the wire screens vary in fineness from 900 to 1,000 meshes to the square inch. The punched plate is prepared for wet crushing. The wire cloth, though affording more discharging surface, wears out faster, and not only is more liable to break, and so permit large particles to pass through, but frequently stretches, giving meshes of irregular size.

The screens are attached to a screen frame which is secured in grooves cast in each end of the mortar, and by two lugs cast in front of the discharge opening, being held firmly in place by a wedge driven behind it in the grooves. A piece of canvas is usually hung before the screen for the crushed ore to splash against as it issues from the mortar, falling thence into the trough below.

THE Presbyterian Home Missions Society has received the following from Alaska: A party of miners returning from a prospecting tour on the Upper Yukon river ran out of provisions, and, becoming too weak to travel, the three strongest were sent forward to the coast. These reached the Presbyterian Mission station at Haines, Alaska, with nothing but their underclothing, and in a starving condition, having been without food three or four days.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1863, C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

JOHN TAYLOR & CO

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, Improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

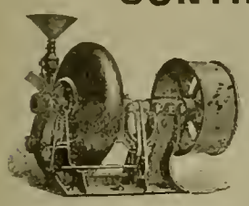
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES



Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. P. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 1 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best In Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 4, 1883.

284,353.—NON-EXPLOSIVE LAMP—Baer, Miner & Taylor, La Grande, Or.

284,387.—REMOVING SAND BARS—Cornelius & Turner, Turner, Or.

284,198.—TWO-WHEELED VEHICLE—Folmer & Bradley, San Jose, Cal.

284,203.—AMALGAMATING PAN—Chas. Gracey, Contention, A. T.

284,204.—DENTAL CHAIR—O. M. Graves, Engene, Or.

284,206.—HEADER SPRING—Samuel Hamilton, Salinas, Cal.

284,307.—HARROW ATTACHMENT—W. P. Kirkland, S. F.

284,309.—HARROW—J. V. Lacy, Salinas, Cal.

284,318.—FOUNTAIN PEN—Jas. B. Mitchell, Portland, Or.

284,326.—SLATE PENCIL SHARPENER—Price & Cook, S. F.

284,327.—GEAR-MOLDING DEVICE—Rasner & Walton, S. F.

284,333.—HOPPER FOR GRAIN SEPARATOR—Jas. Root, Black's Station, Cal.

284,510.—SCREW TAP—J. C. Steber, S. F.

284,514.—WATER-PROOF FABRIC—F. F. Terramorse, East Portland, Or.

3,494.—LABEL—A. C. Stoddart, S. F.

3,495.—LABEL—A. C. Stoddart, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast. Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

HEADER SPRING.—Samuel Hamilton, Salinas, Monterey county. No. 284,296. Dated Sept. 4, 1883. This invention relates to a new and nsefnl improvement in the class of headers, reapers or mowers in wbich the beam is hinged to the main frame, and a long lever attacbed to the framc is operated to raise or lower the header to or from the ground. The general operation is as follows: The main frame is raised and lowered and the height of the cutter adjusted by means of a long lever extending back over the beam. By elevating this lever the front of the header is thrown down, and by depressing, it is thrown up. The stronger the tendency of the header to go into the ground, and thereby to throw the end of the lever np, the greater will be the resistance offered hy the spring, because it will be harder to raise as the lever rises. The power of the spring is therefore nicely gradnated. The lever may be operated by the exercise of small power.

HOPPER FOR GRAIN SEPARATOR.—James Root, Black's Station, Yolo Co. Cal. No 284,333. Dated Sept. 4, 1883. In the frame of the machine is the usual gang of sieves. The hopper on top has a cross slot or apertnre in its bottom. A sliding plate rests on the side of the hopper and is guided by lngs. It is held down on the side of the hopper by means of springs, which thus prevent grain from getting between the sliding plate and hopper. The top of this plate has an adjusting screw, whichextendsnp throngh a stationary nut of the hopper. By these means the sliding plate may he forced down or drawn up to regnlate the opening or slot through which the grain passes to the sieves. Under the hopper back of the feed opening is a curved directing plate for turning the grain forward on the sieves. This means for regnlating the feed is very simple.

DENTAL CHAIR.—Oriel M. Graves, Eugene, Oregon. No. 284,294. Dated, Sept. 4, 1883. The invention consists in the construction and arrangement of the parts and all the necessary adjnstments in chairs of this class. The prime object is to provide an inexpensive chair which shall be effective and easily packed for transportation. The various parts are constructed specially with this object in view.

WINDOW BLIND.—Josesph Williams, San Jose, No. 283,941. Dated Aug. 28, 1883. The patent covers improvements or a previons invention hy the same inventor. The improvements consist in means for pivoting each slat independently to enable it to turn edgewise, or means for turning them all simultaneously and in an improved ratchet-hinge in connection with the swinging gnides.

HARROW.—Joseph V. Lacey. Salinas, Monterey Co. No. 284,309. Dated, Sept. 4, 1883. The improvements consist of certain details of construction or a combination of one or more harrows, with a sulky attachment which follows the harrow, and has a common attachment with the front of the harrow so as to draw from the same point.

GEAR MOLDING DEVICE.—Henry C. Rasner and Augnstus Walton, S. F. No. 284,327. Dated Sept. 4, 1883. This is a new device for molding gears of every description and specially large work and patterns which are difficult to draw. It consists of one or more radial arms extending outward from a common center, and having one or more teeth of the pattern so connected with their outer ends that they may be advanced or withdrawn in a radial line, together with the means for moving and adjnsting the parts.

Another Overland Road.

On Saturday, Sept. 8th, the last spike on the Northern Pacific railroad was driven, and another overland line was completed. It is an event of much importance to the Pacific coast, as it promises that an era of competition in the overland traffic is to begin, and that another agency for the development of onr grand coast regions is to be put in active operation. The ceremonies of the completion of the road were of a very interesting character, and were witnessed by a distinguished throng of people from all parts of the United States, and from several countries of Europe. The scene where the last spike was driven is one of great heanty. It is in Montana, on the north side of Deer Lodge river, bordered with beantiful trees. On the south is a small plain, the whole surrouded with a perfect amphitheater of wooded hills. The site of the jnnction of the east and west lines is 1,198 miles from Lake Snperior, and 2,847 miles from Puget Sonnd. An address was made hy President Villard, who has carried the enterprise to its completion. William M. Evarts, the distinguished statesman and orator, also delivered a speech, eloquently reviewing the history of the great undertaking, and closing as follows:

This last achievement of the intelligence and energy of onr people climbs over the lofty range of mountains which divides the waters of a continent between the two great oceans of the world. It binds togetber by one more indissolnble bond the destinies of a great people who look from the windows of their habitation upon the horses of the sun as they rise from the stormy waves of the Atlantic, and again when they quench their fire in the smooth waters of the Pacific. It forms one more portage for the water-borne commerce which plies between Enrope and Asia. It brings new fields to tillage adequate to feed tens of millions, under whose healthy and happy toil their seed-time and harvest shall never fail, and tens of millions more, less fortunate, who crowd the workshops and the factories, the cities and the mines of Enrope and America in this age of indnstry. It will help to assuage inequalities of nature and disparities of fortune among onr own people, and to spread peace, plenty and prosperity to other nations. Nor does it lessen our gratitude and gratnlations that this is not the first, and that it will not be the last, that this wide land of onrs witnesses on the same great scale of effort and beneficence.

It is fonrteen years since the first great continental road was completed through the united efforts of the Union Pacific and the Central Pacific Companies. It was the great event of the times. Since that date the Southern Pacific Railroad has been practically completed from this city to New Orleans; and a second great line, known nnder varions names, but better as the Atlantic and Pacific, has been constructed as far as the Colorado river, there to connect with the now almost completed continental ronte. The Northern Pacific takes its place this day as the third great continental railroad. The fourth, when completed, will be the Atlantic and Pacific, either under that name or some other.

YOUNG, old, and middle-aged men and women get health and strength by using Brown's Iron Bitters.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of snbscription, and give it their own patronage, and, as far as practicable, aid in circulating the jonrnal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year, in advance. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times,) by turning a leaf.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half ounce), 10 cts.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for eo many years, the firm' name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favore. We intend to send none but worthy men.

G. W. MCCREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.

I. M. LEIHY—San Bernardino and San Diego counties.
J. J. BARTELL—Yolo county.
E. P. BILLINGS—San Luis Obispo Co.
REV. S. COODENOUGH—Santa Clara county.
H. W. FOLSOM—Los Angelee county.
C. E. CURTIS—Kern and Inyo counties.

Is the Best Pump in the World. Another New Improvement is Lewis' Patent Spray Attachment.

Can change from solid stream to spray instantly Regular retail price $6. Weight, 4¼ lbs. Length, 32 inches.

FOR SALE BY JOHN H. WHEELER,
111 Leidesdorff St., S. F.

P. S.—A sample can be seen at this office

DEPARTMENT NO 9—PROBATE.—IN THE Superior Court in and for the City and County of San Francisco, State of California. In the matter of the estate of ROSEMOND GREENWOOD, deceased.

Notice is hereby given, that Friday, the 28th day of September, A. D. 1883, at 10 o'clock, A. M. of said day, and the court-room of said Court, at the New City Hall, in the City and County of San Francisco, State of California, have been appointed as the time and place for proving the Will of said Rosemond Greenwood, deceased, and for hearing the application of George Spaulding and Mary Williams for the issuance to them of Letters Testamentary.

Dated, August 29th, A. D. 1883.

[SEAL.] WILLIAM T. SESNON, Clerk.
By E. J. CASEY, Deputy Clerk.

EDWARD W. BLANEY, Attorney for Petitioners.

PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices hy the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St, a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

The Lemmon Herbarium.

This Herbarium has been removed from the Blake House to a permanent place at 1205 Franklin St., near Fourteenth St., Oakland, one square east of the Post Office, where plants of the Pacific Coast, including Arizona, may be determined on application, and instruction given in botany during the winter. Sets or single specimens of the rare and new ferns of the Pacific Coast for sale.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Drytown, Amador county, California.

News in Brief.

LORD WOLESLEY, the hero of the Egyptian campaign, is to be created a Field Marshal.

DIRECT cable communication has just been established between New York and Rio Janero.

THE largest cow in America weighs 3,200 pounds, and gives milk, in Chase county, Kansas.

CITIZENS of Massachusetts who plant four trees by the highway are allowed $1 abatement of their highway tax.

THE Canadian Government offers a bonus of £2 for every able-bodied white man who may settle in British Columbia.

A POSTAL money order connection between the United States and the Hawaiian islands goes into effect January 1st.

ALEXANDER, the colored cadet at West Point, is treated by the other cadets kindly, and no difference is made on account of his color.

A DISPATCH from Pensacola, dated the 10th, says all the patients in the Navy Yard and hospital are convalescent. There are no new cases.

A FORCE of 200 stone cutters, stone masons, laborers and machinists is now actively at work on the construction of the stone dry dock at Mare Island.

IN Alexandria there are still numerous attacks of cholera, but the average of daily deaths is reduced to four. The mortality in the provinces is also rapidly diminishing.

TWO COUGARS that have been the terror of sheepmen for some time in the neighborhood of Junction Bar, Oregon, were treed by a shepherd's dog and shot by a herder recently. They were males, and measured five feet eight inches from tip to tip.

THE general impression at Guaymas is that the disease which has made its appearance there, and is called "the tonto," was caused principally by the neglect of the city officials in not keeping the city clean. They trusted to the rainy season to do this for them, but the rain failed this year, and the rainy season seems to be over.

RELIABLE help for the weak, nervous, and debilitated dyspeptic sufferer found in Brown's Iron Bitters.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables, and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in subdivisions to suit purchasers, at very low rates and on easy terms. There are 12,000 acres at from $3 to $30 per acre, including pasturage, vine, fruit and grain land. Will sell a large tract at a great bargain. Send stamp for map and circular to EDWARD FRISBIE, proprietor (on the Grant), Anderson, Shasta county, Cal.

THE OVERLAND MONTHLY,

A Monthly Magazine.

Devoted to the best interest of the Pacific Coast. This magazine is the exponent of a vigorous literature and has what is so hard to create, A DISTINCTIVE flavor.

☞ SINGLE COPIES 35 cents; yearly subscription, $4.00.

BROWN'S IRON BITTERS

will cure dyspepsia, heartburn, malaria, kidney disease, liver complaint, and other wasting diseases.

BROWN'S IRON BITTERS

enriches the blood and purifies the system; cures weakness, lack of energy, etc. Try a bottle.

BROWN'S IRON BITTERS

is the only Iron preparation that does not color the teeth, and will not cause headache or constipation, as other Iron preparations will.

BROWN'S IRON BITTERS

Ladies and all sufferers from neuralgia, hysteria, and kindred complaints, will find it without an equal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

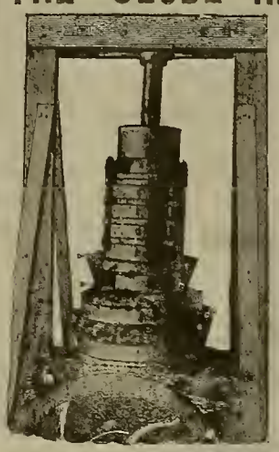
BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.



While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

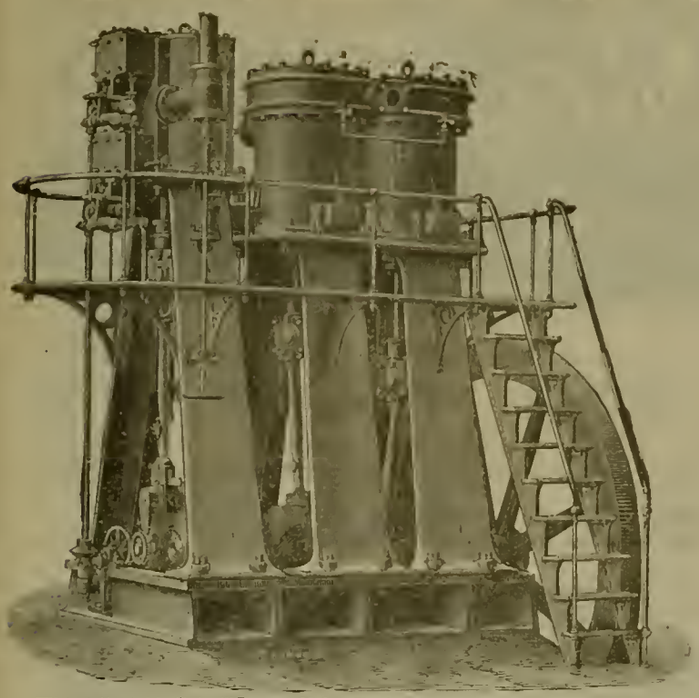
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.



WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

EXCELSIOR BLASTING POWDER,

Manufactured by the

EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro-Glycerine Powder, as safe to use and handle as any other Nitro-Glycerine Powder manufactured. The fumes and gases, common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

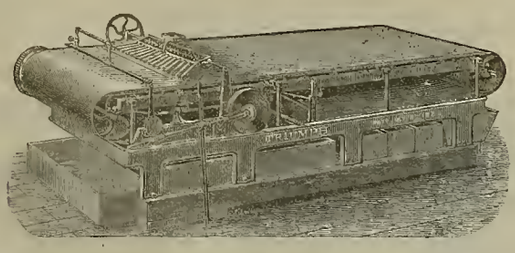
CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of these mills on the Whidden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.



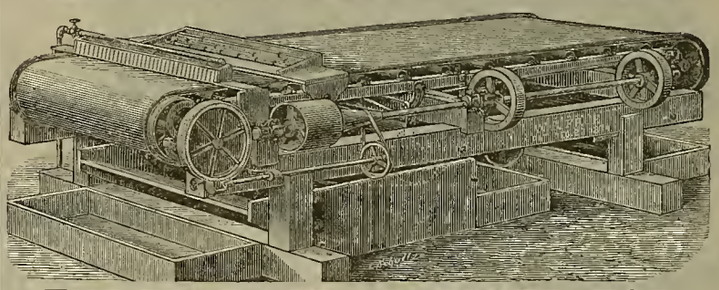
PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.
The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

"TRIUMPH" ORE CONCENTRATORS.

The Best Ore Concentrator in the Market.



In presenting the above Improved Form of an Ore Concentrating Device to the mining public, we feel confident in our ability to supply the demand for a successful, practical-working machine.

One of them can be seen in operation, and we invite the attention of those interested to a critical examination of its merits, and will furnish prices at

JOSHUA HENDY MACHINE WORKS,

Nos. 49 and 51 Fremont St., - - - San Francisco, Cal.

$1,000 CHALLENCE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.
A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.
That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.
That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.
That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.
That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

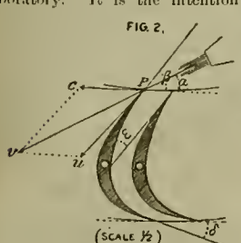
BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 22, 1883.

VOLUME XLVII Number 12.

Water Wheel Experiments.

Trials with a Partial Turbine or Tangential Wheel.



The following article gives the results of experiments with a partial turbine or tangential wheel, by J. Ahern, E. Louisson, J. Neuman and A. D. Schindler, of the class of '83, University of California, under the instruction of Prof. F. C. Hesse in hydraulics, and Ross E. Browne in construction. The matter is one of great interest to the mining community especially.

FIG. 1.

The water wheels which have attracted special interest in the mining regions of this coast are those designated for high heads and small supplies of water. Prominent among these are the Partial Turbines and the so-called Hurdy Gurdy wheels. These are usually fed with small conical nozzles, and it is for this condition of feed that the wheel built in our shop was designed. The water wheels, pressure gauge, etc., used in these experiments, are made a part of the permanent outfit of the Experimental Department of the Mechanical Laboratory. It is the intention to equip this department largely in such a manner as the example in this paper will suggest.

FIG. 2.

In shaping the buckets for full-running turbines, the direction of the discharge is insured by giving great length and little curvature to the discharge end of the bucket, and in fact, about the same form is used for partial turbines. In these, however, several buckets are covered at the same time by the jet, whereas, in our case not even one bucket is completely covered, and the problem is somewhat altered. If the bucket is shaped as shown in Fig. 1, when the jet is parted an important part of the water is "backed"—carried with the wheel, and subsequently discharged with nearly the full velocity of the bucket, and this of course entails great loss.

In designing a wheel to be run by a small jet, it is, therefore, very important to insure the proper direction of entrance of the water into the bucket; and if the bucket becomes too long, it may be shortened at the discharge end. This consideration has led us to the form of bucket adopted, and shown in Fig. 2.

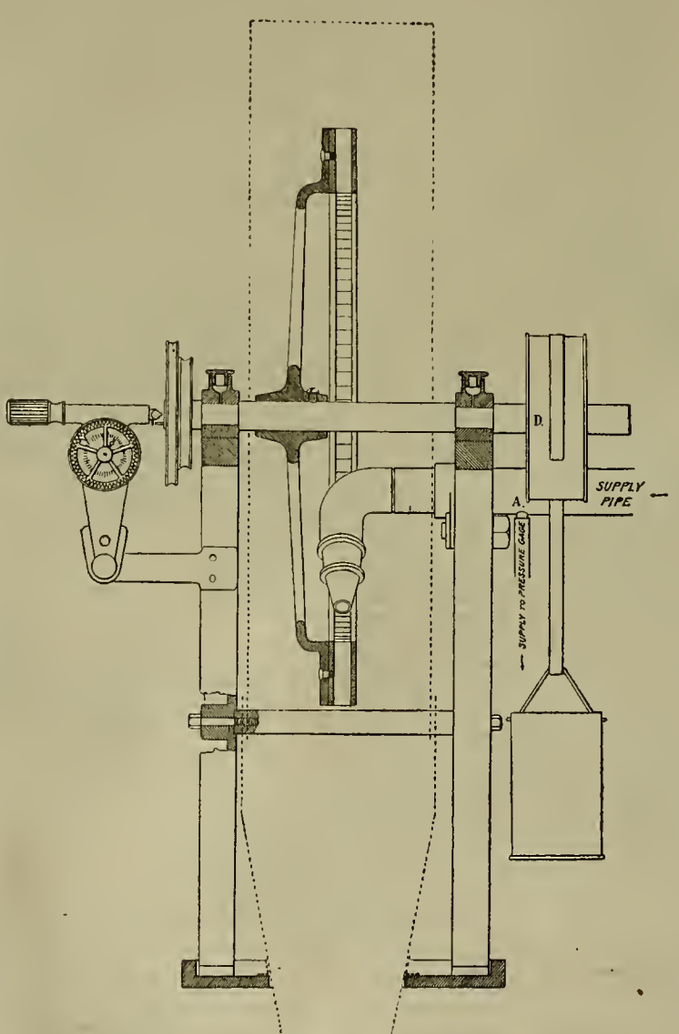
FIG. 6.

$\alpha = 29°$, $\beta = 34\frac{1}{2}°$, $\delta = 20°$.

v—is the actual velocity of jet as discharged from the nozzle.

c—The velocity of point P of the bucket.

u—The velocity of the jet relatively to point P of the bucket.



The greatest angle that any portion of the jet may make with the vane is ε in our case, equal to 30°. Of the water striking at such angle, the portion "backed" is $\frac{1}{2}(1-\cos\varepsilon)$, equal to 7 per cent.

The design was a part of the class-work in the construction-room, the wheel being built in the shop by Mr. Joseph Sladky. The details will be found in Figs. 3 and 4.

The dotted lines indicate a section through the cover.

The buckets may be readily removed and altered, or a new set substituted. The diameter of the wheel is 15½ inches. The head of supply water is from 50 to 60 feet. The width of buckets, 15-32 of an inch. The number of buckets, 90. The conical nozzle giving the best effect, ⅜ of an inch in diameter.

FIG. 4.

DETAILS OF PARTIAL TURBINE WHEEL.

The head of water was taken in the supply-pipe at point A (see Fig. 4), by means of the Hesse water-pressure gauge, which is illustrated in Fig. 5. In this gauge a small quantity of water passes through the minute opening O_2 into the glass bottle B, and discharges through O_1. The water mounts into the open glass tube, which has a properly graduated scale attached.

Designating by—

h_1 —The head of water in the tube above O_1.

h_2 —The head of supply water (hydraulic head) above O_1.

a_1 —The area of opening O_1.

a_2 —The area of opening O_2

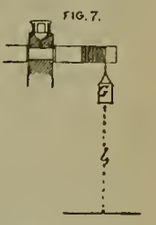
Q—The quantity of water passing through the gauge.

c_1 —The coefficient of efflux for head h_1.

c_2 —The coefficient of efflux for $h_2 - h_1$.

g—The acceleration of gravity.

Then $Q = a_2\ c_2\ \sqrt{2g\,(h_2 - h_1)}$



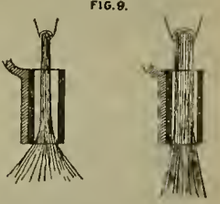
$$Q = a_1\ c_1\ \sqrt{2gh_1}$$

$$\frac{h_2}{h_1} = 1 + \left(\frac{a_2\ c_1}{a_2\ c_2}\right)^2$$

h_1 can be made any desired fraction of h_2 by simply regulating the areas of a_1 and a_2. The values of c_1 and c_2 will vary but slightly, excepting for very low heads; hence the scale is practically uniform. Our scale is graduated to tenths of a foot up to 60 feet, three points marked under known heads forming the basis of graduation.

The useful work was easily measured by swinging two weights connected by a cotton band over drum D (see Figs. 4 and 6). The weight G_1 was held to the floor, and the other weight (G_2) increased until the desired velocity of the wheel was reached. The weight G_1 was then released and augmented with shot until brought into equilibrium with G_2 + the force of friction between the band and the drum. At the same time, the number of revolutions per second (n) was observed with the ordinary speed indicator. (See Fig. 4.)

FIG. 7.



$G_1 - G_2$ is then the force in pounds on the circumference of the drum resisting motion of the wheel.

Let C_1 represent the circumference of the drum in feet, and L_1 the work done in foot pounds per second by the above force; then—

$$L_1 = (G_1 - G_2)\ C_1\ n.$$

However, since the work of the extra journal friction due to the weights G_1 and G_2 should not be charged as loss against the wheel; this was added to obtain the useful work.

FIG. 9.

Let φ represent the coefficient of journal friction.

Let C_2 represent the circumference of the journal in feet.

Let L represent the total useful work in foot lbs. per second.

Then $L = L_1 + \varphi\,(G_2 + G_1)\ C_2\ n$

$$L = n\,[C_1\,(G_1 - G_2) + \varphi\ C_2\,(G_1 + G_2)]$$

A simple experiment was made to determine the value of φ. A strong fine thread was wrapped around the shaft and a weight (G) attached (see Fig. 7.) This weight, being allowed to descend until it reaches the floor, does work in overcoming journal friction and giving kinetic energy to the wheel. This kinetic energy is subsequently converted into heat through journal friction as the wheel comes to rest.

Let l_1 represent the length of thread unwrapped during the descent of weight G.

Let t represent the time of descent of weight G.

FIG. 10

Let C_2 represent the circumference of the journal.

Let C_3 represent the circumference of the shaft.

Let $\mathfrak{G}$ represent the weight of wheel, shaft and pulley, the drum being removed.

Neglecting the unimportant influence of change of φ with increase of velocity, the work done by the weight will be:

$$G\left(1 - \frac{2l_1}{gt^2}\right) l_1$$

Let us designate this work by $G_3\ l_1$. When the wheel comes to rest this entire work will have been consumed in journal friction. The

(CONCLUDED ON PAGE 185.)

CORRESPONDENCE.

Gold Mining in Colombia.

EDITORS PRESS:—Noticing recently some articles in the PRESS on gold mining in the United States of Colombia, I thought of writing a few lines to show the California miners that this is not the only way mining is carried on here. "Diving for gold" in the State of Cauca is only heard of as carried on in the Choco, a few negroes doing this kind of work. Working river beds by using a stone to keep the miner at the bottom, I never heard of before. I wish the locality had been given. In this Department of Ambalemo, Estado de Tolimo, gravel mining is carried on by hydraulic process. The mines are extensive, and they have plenty of water. Most of the mines are in the hands of the English and native companies. The following is a list of the different mines which are at work or in shape for working, stating amount of water, etc.:

Mines.	Company.	Water, Miners' In.	Giants.	Nozzles, Inches.	Gravel.
Malpaso.....	English.	500 Each.	2	5	Hard blue.
Rio Sucio.....	English.	500	1	5	Soft red.
Cajongora.....	Native.	400	1	3 to 4	Soft red.
San Miguel.....	Native.	300	1	3	Soft red.
Campion.....	American.	250 Tank.	1	4	Soft red.
Tablazo.....	Native.	200 Tank.	1	3	Soft red.
San Indo.....	Native.	350	1	3	Hard on the bottom.
Mina Nene.....	Native.	250	1	3½	Hard on the bottom.
Mina Patilla.....	Native.	300	1	3	Soft red.
La Pava.....	English.	500	1	5	Soft red.
Orita.....	English.	2,000	2	5	Soft red.
La Reforma.....	Mr. Oakes.	300	1	3	Soft red.

The last three mentioned have machines and pipes on the ground ready for work. There are also the mines La Rica, Malabar, Tres Canoa, Palenge, Las Palmas, Gallnazo and Panuelos not at work. Other mines are worked by hand. Labor costs about seventy to eighty cents a day. CARLOS FAULHABER.

A Case in Point.

EDITORS PRESS:—I was somewhat amused by reading in a recent number of your paper an article headed "A Case in Point." Now the case in point means, if I understand it right, that our present processes for the recovery of the precious metals are behind the age. Now, I wish I could write newspaper articles, and I would astonish the world. I also wish I was a scientist, and I would soon be a millionaire. I watched the operations of harvesting a few weeks ago on one of our valley ranches, all the details of which were entirely new to me, but I was favorably impressed with the almost automatic performance of the various appliances, but could not fail to notice the loss of grain at each stage. I feel justified in stating that eighty per cent did not reach the grain sacks. I also visited the blacksmith shop in the same establishment, where the blacksmith was welding two pieces of iron together, and estimated that the amount of heat contained in the iron did not amount to one-tenth of one per cent of that evolved by the fuel used, and yet that wasteful method has been going on for centuries. That is a nut for Edison to crack. I visited our local foundry, and upon inquiry found that eighty per cent of the iron put into the cupola was considered a favorable yield of castings. And I have no idea that eighty per cent of the materials used by the wagonmaker enter into the finished wagon. I would also ask if ninety-eight per cent of the ink employed to print the MINING PRESS finds its way into its columns? And last, but not least, it grieves me that so much of one's toddy sticks to the glass when a friend feels generous enough to treat.

Now, Mr. Editor, I am of the opinion that the practical methods for the recovery of the precious metals are in advance of any branch of industry that I am acquainted with. For example, supposing a ton of lead ore to contain from three to four pennyweights of the metal, is there any metallurgical process in existence that would recover 80 per cent of it, leaving the important question of profit and loss entirely to one side?

Now, I want to know whether we have arrived at such a degree of perfection in the application of our old established methods as warrant throwing them all aside and looking in another direction for something better?

If you can cull an idea from the foregoing that you think would be any use to anybody you are welcome, and if not, please excuse me for troubling you. ARTHUR COOPER.

Greenville, Plumas county.

"Tools and the Man."

The following extracts are from an oration delivered at the opening of the Mechanics' Institute Industrial Exhibition in this city last week by Rev. Robert McKenzie:

Every throbbing cylinder, every revolving wheel, every sharp-edged instrument that moves in the fair, sings the words, "Tools and the man." In the one scene there we saw a beautiful tableau of what the world was; in the other we see an equally interesting tableau of what the world is. The one is the poetry of yesterday; the other the eloquence of to-day. This century is drawing to a close. It will soon be put on the shelf as you put your last year's ledgers. It will receive a label to mark it among all the others. How shall we label it? One age on that shelf is marked "Cæsar," another "Creeds," another "Crusades," another "Reformation," another "Revolution." Our age, I take it, will be labeled "Mechanics." For the railroad, the telegraph, the electric light, the hundred appliances for our homes and fields are the distinctive features of our century, and they are all the children of the mechanical spirit.

Wherein Mechanics Develop the Man.

We hear much of the power of metaphysics, or art, or the study of natural science to develop the man, together with an implication that mechanics have no such power.

A Rabbi was wont, on leaving the Academy, to pray thus: "I thank thee, O Lord, my God, that thou hast given me my portion among those who frequent the House of Instruction, and not among those who are busy at the street corners; I apply myself early to the Law, and they to vain things; I work and they work; I run and they run; I run after eternal life, and they run to the pit."

I take issue there, and claim that mechanics form a field in which a man may find room for full development, and in which he may find a path that leads to equal glory with the proud academician.

1. Mechanics develop the thinking faculties. I have a carpenter's bench near my study, to which I go when weary of theology or history, not for mental rest, but recreation; not for the cessation of thought, but for a change of thought. I find that at that bench it requires as much accurate and intense thought to miter a molding for an octagon or pentagon, as it does to find the five or eight leading thoughts in a text. I find that it requires the same logical acumen to put up an intricate piece of machinery, as it does to array my material into the form of an essay or a sermon. I grant you there are drudges at the bench that only carry out other men's thoughts, and perhaps we might find equal drudges at the student's desk. But some one had to think, and when a steam engine or a sewing machine is put up complete and ready for work it is as great a triumph of human intellect as an Illiad or a Paradise Lost. The new Brooklyn bridge, the latest triumph of mechanics, is a greater trophy of human intellect than an oration from Daniel Webster or a new volume of history from Bancroft. Moreover, the men who lead in the confessed field of intellect wait for the skill of the mechanic. The discovery of a star, the combinations of chemistry, the revelation of microscopy, all depend upon the deftness of some mechanic's hand and the genius of his brain. And the discoveries thus made are immediately seized by the mechanical spirit and turned into usefulness and profit for the world. There is not an ascertained fact in science, or discovery in geography or chemistry, or combination in art that is not woven by our mechanics into the fabrics exhibited in the Pavilion. The farmer, the weaver, the builder, the engineer, all hasten to apply the fruits of intellect to their labors.

The students of Socrates love to tell us that while a soldier, and hearing the morning call to arms, he hastened to dress himself; but while yet in the process of putting on a necessary garment some thought of lofty speculation arrested him, and there he stood for many hours, heedless of his garments, heedless of the tramp of soldiers and the din of war, lost in great thought. Over against that great intellect mechanics can place a hundred men who forgot to eat or sleep, who sat all oblivious to the surrounding circumstances, pursuing by intellect some new invention or

Improvement in Mechanics.

They develop the imagination. As you examine the implements of industry or the conveniences for home life in the fair, you will see that the study of inventors and manufacturers has been not only to make a thing strong and useful, but also to make it beautiful. All through that exhibition you will see the fruits of intelligence glorified by taste and imagination. The Greeks thought it a pity that any one should die not having seen the statue of Jupiter Olympus. I think, however, that you will search all galleries in vain for anything more beautiful, and majestic in its beauty, than a fast train sweeping around a curve, or a suspension bridge.

The Greek would pity us, never having seen the statue by his famous artist. We can well pity the Greek, never having seen this thing of strength, of usefulness, and yet that undulates and vibrates in its beauty, as if it felt its own worth, the work of our famous mechanics. For a long time the merely beautiful held the admiration of men; they did not ask, indeed they did not expect it to be useful. When Bacon came he turned the world away from the merely beautiful to the merely useful, and provided a thing was useful they did not ask or expect it to be beautiful; hence almost all the earlier inventions of the past 200 years were rude in their strength and unsightly in their usefulness.

Our Day Sees Mechanical Skill

Striving to unite these several qualities—usefulness and beauty. And has it not succeeded? The very carpets on your floors, the new papers on your wall, the furniture in your rooms, are models of usefulness and museums of art. You have but to look at any of our first-class merchants' wares in the fair to see that the mechanic has had a wide field and a deep inspiration for his imagination. It develops wealth. The ancient Jews had a wise proverb applied to all labor. "It is gold at bottom." Gold once followed only the sword. Those were days when men *carved* out their fortune. Days when the good old rule, the simple plan, "Let him take who has the power and keep who can," obtained among men. Much gold is no longer discovered by the sword. Commerce, buying and selling, was the next mine that produced the great fortunes. It made our merchant princes of the world's larger cities. That mine is still productive. Mechanics have opened another shaft to wealth, and among the millionaires of to-day are men who have reached their wealth by the invention or manufacture of machinery. There are mechanics commanding larger salaries to-day than are paid to the average man in the three professions.

The Field for Intellect.

The field for intellect and imagination in this direction is so comprehensive that it can employ the first grade of talent, and in the great manufacturing centers this first class talent receives as large a money compensation as if it were applied in the law or in medicine; and if there is anything in fame, that, too, can be reached by this path. Goethe, when about to pass away, regretted the prospect that lay before the men that were then young. It seemed to him that nothing great was left to be done. He thought all the great poems, dramas, problems, discoveries—all great and famous things, were reached, and it was left for coming men only to admire and imitate; and yet here lay a field, almost unknown in Goethe's day, in which men have made discoveries as great in fame as that of Columbus, and more in value to the human race than Goethe's own famous Faust—a field which is yet only partially explored; in which vast possibilities lie before every young mechanic, leading him to still more lasting fame.

It is but yesterday since, if a mechanic sought to rise to notice, he must leave his own work and enter another presumably higher class. Hugh Miller reached fame not by being a mason, but through the study of geology. A decided change has lately taken place. The upper classes that once looked for fame only in politics or the army or navy, are turning their attention to mechanics, and one titled man in England is never so happy as when driving a locomotive on the railroad.

At last the mechanic has lifted himself by lifting his work into prominence. He can now reach the top of manhood, not by passing to another sphere, but by excellence in his own. There are heights there from which he can look into the face of poet and scientist on a level with their own. Hugh Miller could now reach fame, not only as a geologist but as a mason.

Art Can Tell a Lie.

Yet sometimes finds its chief attraction in its lie. Theology can tell a lie and sometimes finds its popularity and its price in that lie. Natural science can tell a lie and sometimes founds its conclusions on that lie; but there are two things that cannot afford to tell a lie; these are mathematics and mechanics. The lie will out; will work speedy failure. A mechanic can put a lie into his work and have the painter hide it for a little time, but only for a little time. One mechanic was found making the hub of a wagon wheel out of a block of soft pine. When reminded that pine was not the true stuff for wagon wheels he said, "never mind, they won't know; it is going to be painted." He thought he hid his lie, but the first time the teamster turns his wagon out of a street car track, the paint will not be sufficient; the weak lie in the hub will become eloquent, and will damn the man who made it. A mechanic may be a liar and dishonorable, but he does not learn his infamy from his work; he dare not put his dishonor into his work. Your eyes will search all that is exhibited in this fair, and some eye will be keen enough to detect the lie put into any machine. Like the old knights he puts a check mark on the falsehood, and that lie condemns the machine.

Competition

In speed, in power, in accuracy of work is too sharp for this community to be indifferent to the character of each implement or production thus exhibited. Herod, in building the last temple in Jerusalem, employed 18,000 mechanics. The work was given out in piece work of so many ells. The ells were somewhat longer than usual, so as to avoid both the possibility and appearance of unfaithfulness in holy things, and thus because they were holy things, but all things are holy. The man framing a baby's cradle is building a temple, a temple where God and his angels are. The man building a ship is building a holy thing where property and lives and the fate of immortal souls may yet be decided; every link of anchor chain the blacksmith welds must be hammered with honor and truth, for yet the lee shore, the ruthless breakers and the howling night will test his work and search for a lie in it, and a hundred human lives will hang between life and death on the honor or dishonor that moved the arm of that plain mechanic at the anvil. The mechanic cannot afford to tell a lie.

Leadville Smelters.

Messrs. Eddy, James & Co. have succeeded in securing one-half the out-put of the Morning and Evening Star for the next six months. They continue to ship about 400 tons of ore per day to Denver, Pueblo and Omaha, and the steady drain is telling on the reserves of ore in Leadville. Next month, the Eilers furnace will be in blast, and Pueblo will then consume nearly as much ore as Denver. At the present time, the production of ore in this district, including Red Cliff, Ten Mile and Leadville, is probably something like 1,350 tons a day, and is not visibly increasing—at least in any marked degree. On the other hand the smelting capacity of the State is steadily on the increase. Within a few days the Elgin smelter has blown in. It is known that the Royal George smelter is preparing to double its capacity, and Mr. Eilers will add more stacks as soon as he can buy ore to keep them going. The situation points to a sharp struggle among the Leadville smelters for ore, if not for existence. If the valley smelters succeed in starving out the smelters in the mountains, they will have the miners at their mercy, and the latter, in self-protection, will have to do their own smelting. There is no reason in the world why such great mines as the Iron Silver, the Silver Cord and the Morning and Evening Star should not buy smelting establishments, or erect them, for the treatment of their own ores. The experiment did not succeed at the Little Chief or the Adlaide; but every one knows why it failed.

To smelt successfully, in competition with the great smelting establishments in this State, a man must know the business thoroughly, and must possess a high order of talent. But such men can be got. It seems curious that the railroads, by making so wide a difference between the freight on bullion and the freight on ore, should have discriminated against the mountains in favor of the valley. It might have been supposed that they would have seen their interest in the development of the mountain towns where their traffic originates. But they seem to have taken a different view. At the present time, and with the present tariffs, it is cheaper to send ore which runs 40 and 50 per cent in lead to Denver or Pueblo to be treated than it is to convert it into bullion at Leadville. The consequence is, that with the exception of the Morning Star ore, half of which goes to Cummings & Finn, and a few of the Red Cliff ores, which go to the American, nearly all the high lead ores are going to the valley, and the Leadville smelters are running on a percentage of lead which two years ago, would have been thought entirely inadequate. It will be curious to watch how the struggle progresses and where it ends.—*Ten Mile News.*

A New Coal Field.

A correspondent of the Chicago *Mining Review*, writing from Gunnison, Colorado, contributes the following concerning the coal fields of that country: The first "camp" at which I called was Crested Butte, a town of 1,300 inhabitants, situated at the terminus of the branch of the Denver and Rio Grande railway, connecting it with the town of Gunnison, some thirty miles to the south. Crested Butte may unquestionably be named the coal town of the Gunnison country, as its present, as well as future, depends almost entirely upon the development of the extensive bituminous and anthracite coal field by which it is surrounded.

About one mile to the west of the town the Colorado Coal and Iron Co. are now mining coal on quite a large scale, taking it to the town, where it is burned into coke. In prosecuting this work they now have fifty men employed and fifty coke ovens in operation. Their affairs at this place are under the management of J. K. Robinson. To the north of the town, and within a distance of five miles, there are immense anthracite coal beds, which are being steadily and gradually developed by the "Mesa Mining Company," under the management of Howard F. Smith, who has already expended large sums in development, as also in the erection of a number of buildings and a breaker. This company is now competing for the trade in the States and Territories west of Colorado. Their coal is a No. 1 article, and commands a high price.

The coal is of the bituminous variety, and has been proved by many practical tests to be of a very superior quality. It has been repeatedly used in stoves, fireplaces, grates, limekilns and blacksmiths' forges, and has been declared by all to burn freely, and blaze brightly, in short, has proved itself a first-class article of bituminous coal. It has been tried in steel manufacture, and been declared the very best coal for the purpose. Several carloads have been used in Colton, and invariably with the highest satisfaction. This promising property is owned by McIntosh & Cheney, who are steadily developing it.—*Colton Semi-Tropic.*

MECHANICAL PROGRESS.

The Testing of Locomotives.

The *Railway Review*, in a recent issue strongly urges the experimental testing of locomotives, and in view of the importance attached to the subject, the following, taken from our contemporary, may prove interesting:

The records of the test should include a detailed description of the locomotive and of the cars drawn, as regards type, dimensions and weights. The data of the trial paper should include the weight and temperature of feed, water, the weight and chemical composition of the fuel, the weight of ashes, the pressure and quality as to dryness of steam in boiler at different intervals, the temperature of the fire and up-take, the barometric pressure and humidity of the atmosphere. The pressures and temperatures, as well as the indicator cards, should be taken at regular intervals, as well as the number of strokes of the piston. Of course the position of the throttle and like particulars in regard to valves should be carefully noted.

When these data are all at hand it becomes no difficult matter to determine the actual performance of the locomotive—that is, to determine the pounds of steam and fuel consumed per horse-power per hour, and to ascribe the nature of the result to its true causes. The reason that it is necessary, besides knowing the weight of fuel, to know the weight of ashes and the chemical constitution of coal, and perhaps of the products of combustion as well, is that thus the engineer is enabled to learn whether the good or poor performance of the locomotive is attributable to the quality of the fuel, to the state of perfection or imperfection of the combustion, or to the design or proportions of the boiler, and thus to locate the cause of excellence or the reverse to some special feature of the boiler or of the fuel. It may, however, prove that all these conditions are normal and do not account for the special result achieved. The weight of steam, taken in connection with the records of the indicator card, then furnishes the clew.

It is necessary to know the quality of the steam, for the water feed to the boiler may be evaporated into dry steam, or the steam may be wet or superheated. If the steam is wet it should count against the boiler, if superheated in favor of it, and *vice versa*, in judging of the efficiency of the engine proper. The difference between the boiler pressure and initial pressure in cylinder, as shown by the indicator card, may prove an insufficient diameter of the supply pipe; an excessive fall of pressure at admission may prove insufficient port area for the special conditions of steam use, the cut-off may not be the most advantageous, nor may the cushioning, back pressure or initial pressure carried be the best. By taking the same locomotive and running it under different conditions of steam use and service, the effect of any one special condition can be determined, and that expressed in a percentage of efficiency or usefulness. Of course good judgment and sound engineering knowledge are essentials to arrive at correct conclusions, but without the records of such complete experimental trials, good judgment and sound engineering knowledge, as far as the economical use of steam in locomotives is concerned, are of comparatively little avail.

When no remedy is at hand, blind groping in the dark on chance of stricking the remedy is the result, and virtually the "apprentice" system of test is no test at all, and reveals nothing. Let us have a class of experimental testing of locomotives, which equals the best models of stationary practice, and let the test be undertaken, as important trials are in stationary practice, by specialists of undoubted ability and experience. Then will an improvement in locomotive practice be developed fully equal to such as have been already accomplished in stationary practice.

Testing Timber.

Besides straight and close grain, freedom from sap, shakes, and loose knots, says an exchange, good timber, such as the best deals, should have a uniform color throughout. Appearances of timber may mislead if they are not in accordance with well understood characteristics of soundness. In the same species of timber the strougest and most desirable specimens will be marked by narrow, regular, annular rings, indicating slow growth and close texture. The cellular tissue, as seen in the medullary rays, should also be firm and compact. Uniformity of substance is one of the chief characteristics of good timber; dead knots, flaws and shakes are of course prejudicial, and affect the strength. In sawn timber, the architect should see that the surface is not woolly, and that it does not clog the teeth of the saw. A bright silky luster ought to be apparent when planed, while a dull, chalky appearance, says one authority, is a sign of bad timber. When the annular rings are porous, the wood is weak. It has been remarked that good timber is sonorous when struck, while a dull, heavy sound betokens decay. Star-shakes, cup-shakes, or splits in the direction of the rays and rings, are to be avoided, especially heart-shakes, which prevent large scantling being cut. Good deals have a uniform color, and a darkness of tone is a sign of strength and durability. In best pine timber the annular rings are hard, of a dark-red color—but these vary in tint; the rings ought not to exceed one-tenth inch. Oak, if of the best kind, should have a pale, brownish-yellow color, with a perceptible shade of green, a firm and glossy surface, and hard and compact medullary rays. Another authority observes: "Bright-looking timber is better in quality than dull, and that which is smooth in the working better than the rough or woolly-surfaced; the heart of trees having the most sap wood is generally stronger and better in quality than the heart of trees of the same species that have little sap wood." No doubt the microscope affords a better test of good timber than the unaided eye. The use of the microscope in testing timber was noticed in a paper read at the Franklin Institute, Philadelphia, in which the author showed that timber condemned by that instrument cannot be mistaken, and after once seeing and comparing samples of good and bad wood, it is easy to recognize the difference with a pocket magnifying-glass. The micro-photographs of timber of different sorts have shown that in the strong kinds the concentric layers are close in texture and narrow in width, and the radial plates numerous, wide, long and stout; while in poor wood the opposite characteristics prevail. With such sections of timber of known strength, it would be easy to discard samples which did not exhibit the same number of rings or radial plates per inch of section.

Test of Straw Lumber.

Some straw lumber, accounts of which have within the past few months appeared in the technical press, was recently subjected to tests in Chicago, and, judging from the particulars now at hand, it would seem that the material, while possessing some very good qualities, still has not met all expectations. In this particular case, however, the unfavorable results of the experiments have, in a measure, been attributed to the fact that the material was not equal to some samples which have thus far been placed upon the market. When used as a ceiling the material was found to serve very well, but when used as a floor the results were apparently not at all encouraging. As described by one of our Western exchanges, it appears that in this case the lumber was laid as an experiment over another floor, the slabs being first treated to a peculiar solution. There was considerable trouble and expense attendant upon laying it, the slabs requiring to be placed and jointed very carefully. The material was found to be neither durable enough for this purpose nor devoid of warping tendencies. It was also readily attacked by heat and moisture, the results being occasional uneven patches of surface, blisters, etc., while some of the pieces warped to such an extent as to draw out the nails.

However, the possibilities respecting future results are still very great, and in course of time, when experience shall have demonstrated what can be done in that direction, it will not be strange if the process of making straw lumber, or some similar material, will have resolved itself into an unquestionable success. Probably the safest way of using the material now is to apply it to numerous smaller uses which will not require great strength or endurance. There are, in fact, a great variety of methods in which it can be successfully employed, and the mere fact of a few discouragements at the beginning does not do away with the probability that these difficulties may ultimately be conquered.

WEAR OF MILL ROLLS.—A prominent miller who has been using a large number of roller mills since they first came into use in this country, says the life of smooth roller journals is about four years, and of those on corrugated rolls from six to seven years. He says their breakage is caused by the constant jar to which they are subjected, which crystallizes the iron. The shorter life of the smooth roll necks is accounted for by their jumping motion under the high pressure under which they are run, which causes them to touch and fly apart as the feed varies, resulting in a constant vibration.

SOMETHING NEW IN STREET CARS.—On the Hamburg tramways a number of cars with flangeless wheels, much like omnibuses, and with turning gear, are working. To run on the line, these cars are fitted with a shaft in front of the front wheels, this shaft carrying on a lever a disk wheel, which the driver can lower into the tramrail groove as he requires, or raise it when it is necessary to get out of the way of obstructions. The arrangement works well, saves a lot of trouble, and the cars run easier than those with flanged wheels.

CAST IRON CHILLED TOOLS.—At a recent meeting of the Institution of Mechanical Engineers, in England, Mr. Fielding exhibited some cast iron chilled tools, and said that with chilled tools—the cost of which he showed to be merely nominal—he was able to turn cast and wrought iron and gun metal at from 50 to 100 per cent higher speed than with tools made from steel. He expressed surprise that such tools had not come into more general use.

SOFTENING CHILLED CASTINGS.—Heat the metal you wish to drill in the fire to a little above a cherry red. Then remove it from the fire and immediately place a lump of brimstone (sulphur) on the part to be drilled. You can keep the metal on the fire so as to retain heat and continue to throw sulphur on it until it will be as easy to drill as pot metal is.

SCIENTIFIC PROGRESS.

Some Undiscovered Truths in Geology.

At the recent meeting of the American Association, for the advancement of science, held in the city of Montreal, Canada, the President, Dr. J. W. Dawson, of Montreal, addressed the body on "Some Undiscovered Truths of Geology." It abounded in interesting thoughts, of which but an epitome can be given. His subject covered the whole history of the earth in all time, allying itself at the beginning with astronomy, physics and celestial chemistry; and dealing along its course with meteorology, geography and biology, and finally getting mixed with questions of archæology and anthropology. We copy the following synopsis of the doctor's address from the *Scientific American:*

In such a wide sweep we need not be surprised to learn that there are yet some unsolved problems. We are met at the outset with an inquiry as to man's place in the nature he is to study. His organism is certainly a part of nature, and he is the terminal link of a long chain of being. As a scientific animal, man finds within himself a mind more potent than matter, and that reacts on nature. We recognize this difficulty when we divide science into experimental and observational. It does little good to meet mysteries by guesses, nor should we on the other hand resign ourselves to ignorance. We must wrestle with the unsolved questions of nature, mastering what we can, and leaving others to be grappled with by our successors. In proceeding to mark out the limits of ascertained knowledge, the speaker began with the oldest rocks, a formation of immense thickness, and corresponding to what used to be called fundamental granite. He intimated his belief that this was deposited as gneiss from a shoreless ocean. The Lower Laurentian rocks probably limit our progress backward, beyond which lie only physical hypotheses as to a cooling incandescent globe. Ascending, we meet with significant changes. Beds of limestone are associated with the beds of gneiss. Gravel beds show the existence of shores; and graphite informs us of some sort of plant life, and iron ores of organic matters. In the Middle Laurentian appeared the *Eozoon Canadense*, probably the oldest form of life of which we have any knowledge. Metamorphism next came into play. Nothing in geology perishes. Heat may change clays into slates, and limestones into marbles; but nothing wholly disappears. A great battle rages over the genealogy of the rocks, the steps of which Dr. Dawson set forth, claiming that the sudden incoming of life in varied forms baffled biologists and furnished an unsolved problem. The theories of evolution are insufficient to account for it. The process still is as mysterious as ever, and a great gap is left in our accumulated knowledge.

Suppose that we start, however, with a number of organisms ready made; we ask, how can these have varied so as to give us new species? It is a singular allusion that variation may be boundless, aimless and fortuitous, and that development arises from spontaneous selection. Varieties must have causes, and the vast and orderly succession of nature must be regulated by fixed laws, only a few of which are yet known to us. One consideration showing how imperfect are our attempts to reach the true causes of genera and species, is the remarkable fixity of leading types. Trace certain forms of life along their own line through stupendous vicissitudes and across the ages, and you find them substantially unchanged. Examples are the foliage and fructification of mosses, the venation of wings of insects, the structure and form of snails; all of which were settled in the carboniferous age.

Huxley holds that there are but two possible alternatives as to the origin of species viz., 1. Mechanical construction, 2. Evolution. But we know that instead of two there are numerous possible methods, such as absolute creation, mediate creation, critical evolution, and gradual evolution. The origin of whales affords an example of the difficulties arising from referring existing forms to imaginary ancestors. Gaudry, though a strong evolutionist, candidly says, "We have questioned these strange and gigantic sovereigns of the tertiary oceans, and they leave us without a reply."

The periods of rapid introductions of new forms of life were not periods of struggle for existence, but of expansion; while the real periods of struggle were marked by depauperation and extinction.

Another unsolved problem is the inability of palæontology to fill the gaps in the chain of being. Many lines of being present a continuous chain. On the other hand, the abrupt and simultaneous appearance of new types in many specific and generic forms, over wide areas, obliges evolutionists to assume periods of exceptional activity alternating with stagnation—a doctrine scarcely differing from the old theory of special creation. Plainly a vast amount of conscientious work is needed to account for these breaks in the chain.

Another mystery yet unexplained is the cause of the great movements of the earth's crust by which mountains and plains and ocean beds have been formed. It is known, however, that much is due to the unequal settling of the earth toward its center, and also to the pressure of the ocean against the shore. Complex movements of plication are more easily comprehended than the regular pulsations of flat continental areas, each change being accompanied by changes of climate, plants, and animals.

The problems as to coal formations, the ancient fucoids or algæ, and as to the great and much debated glacial period, next received attention. What caused the great climatic changes that have occurred during geologic time? How came there to be a vast continental glacier reaching as far south as the 40th degree of latitude and thousands of feet thick? Shall we not after all have to give up this favorite theory? May not many of the phenomena be explained by supposing a glacial sea with Arctic currents and icebergs wafted southward more due to local glaciers? It may also be questioned if glaciers are not relatively protective rather than erosive agencies, and if sufficient importance has been attached to their work in leveling and filling old hills and channels. Still another question is as to how long a time has elapsed since the glacial era. Recently the opinion has been gaining ground that its cessation dates back only 6,000 or 7,000 years. This problem, of course carries with it the question of the origin and early history of man.

The practical inference is that we are but newcomers on this earth, and have had but little time to solve such great problems. Geology is young, scarcely a century old. We are surprised that so many regard it as a complete and full grown science. Humility, hard work, and abstinence from hasty generalizations should characterize geologists for at least a few generations to come. Science is light, and light is good. Let us raise it high enough to shine over every obstruction that casts any shadow on the true interests of humanity. Above all, let us hold up the light and not stand in it ourselves.

The Origin of Lightning.

In explaining satisfactorily the phenomenon of lightning, a difficulty is encountered in accounting for the enormous electric tensions, which are necessary to explain the great length of the spark often observed. The theory is advanced by A. Fick that the high tensions are produced by the sudden concentration of electricity already existing in a free state. This concentration is caused by the formation of large drops of rain from the small vesicles of moisture existing in the clouds, by which the surface upon which the electricity exists is greatly diminished. The sudden formation of drops of water from the mass of aqueous vapor may be due to the advance of cold air-currents. Mr. Fick endeavors to answer two objections which may be urged against this theory: 1. That in every rain storm lightning ought to be seen. 2. That it ought to rain whenever it lightens. To the first objection he replies that the drops may be formed gradually, and not suddenly, in which case the tensions would be dissipated gradually; and to the second, that drops are always formed in connection with lightning, but that in falling to the earth they sometimes encounter a layer of dry air, and are absorbed in their passage.

FILTERING DISTILLED WATER.—Herr Eiselt recommends the use of sponge for filtering distilled water. The filtration goes on with great rapidity, and the product is as clear as crystal. When filtered through paper, distilled water soon exhibits a sediment, which is never formed when filtered through sponge, so that the bottles scarcely need cleaning after several months' use. The apparatus that he employs consists of a bottle with an opening near the bottom, from which descends a bent glass tube. This tube is about six inches long and one inch and one and a half inches in diameter; at each end is a perforated rubber stopper, bearing a narrower glass tube. The wide tube contains one or two long strips of fine sponge that have been cleaned with dilute hydrochloric acid and then dried. The bottle to which this filter is attached must not be larger than the one placed beneath to catch the filtrate. The sponge, of course, must be cleaned every few months.

GOVERNMENT chemical laboratories exist in France for testing the qualities of food, wine and all articles of consumption and use that are subject to fraud and adulteration. The officials of these government laboratories are constantly employed in detecting adulterations. Deleterious adulterations of food and wine are destroyed. Other adulterations that merely affect the quality of the articles offered for sale and are not hurtful, except as frauds upon purchasers, are confiscated and sent to the hospitals. The laboratories belong to the police force of the government, and are designed to facilitate the detection and punishment of knaves. Our own government would do well to take some steps in this direction.

FLOWERS COLORED BY ABSORPTION.—At a late social entertainment, the Princess of Wales is said to have carried a bouquet of large lilies, tinted with delicate pink and blue by the absorption of dyes through the stems. The dyes do not in the least affect the perfume or freshness of the flowers. The process is the discovery of Mr. Nesbit. It is said flowers refuse to absorb certain colors. Some of the lilies which had been treated with purple dye separated the red from the blue, the colors being divided in the process of absorption.

THE first steel rail successfully made in this country, and which was rolled at Chicago, May 25, 1865, is said to have represented over $500,000 in experiments and outlays.

THE semi-annual statement of the Eureka Tunnel Mining Co. shows 1,425 tons ore smelted in the six months ending August 31st, the same yielding $52,114.

Mining Share Market.

A weak and sluggish market seems to be the rule of late. The miners are hard at work up on the Comstock, and hopefully advancing their drifts in various directions, but no bonanza has been uncovered for many a long month. The *Enterprise*, thinks that the outlook at the north end is good. More quartz is being found at and below the 3000 level of the Union than was encountered on any of the levels above, and all the quartz—even to the smallest stringers—is metal-bearing. This is a new and good feature. It shows strength and fertility. The Ophir folks are now opening out to the west on their 150 level by means of two-cross-drifts. In this old ground there is doubtless much ore that will pay very well for extraction and milling. The drifts will open the ground considerably below the point where milling ore is now being extracted from the old croppings. The winze in the Hale and Norcross is now near to the 2700 level. At this depth crosscuts will be run both east and west. Work on the 2700 level will be watched with great interest by all mining operators. The fact that the narrow streaks of ore in the winze have held out for a distance of over 100 ft gives assurance that the broader veins lying to the west have not deteriorated. At Gold Hill the Yellow Jacket, Crown Point and Belcher are still awaiting the starting up of the mills on the Carson river. Steam power is being placed in the Brunswick mill, therefore in the future there will not be a total cessation of ore extraction upon the failure of the water in the river.

Bullion Shipments.

Mt. Diablo, Sept. 10th, $6,549; Northern Belle, 10th, $3,658; Standard; 10th, $19,844; Bodie, 10th, $7,749; Ophir, 15th, $12,063; Contention, 14th, $19,043; Mt. Diablo, 13th, $4,803; Ontario, 14th, $12,459; Crescent, 14th, $4,930; Stormont, 14th, $2,585; Hanauer, 14th, $12,415; Crescent, 15th, $6,280; Hanauer, 15th, $5,000; Nevada, 15th, $900; Horn Silver, 15th, $33,000; Vienna, 15th, $2,670; Horn Silver, 17th, $15,000; Ontario, 16th, $8,026. During the week ending Sept. 15, there were shipped from this city 55 cars of bullion, 1,353,604 pounds, sent East; eight cars ore, 225,390 pounds, sent West; two cars ore, 65,800 pounds, sent East, and one car white lead, 23,000 pounds, sent West; making a grand total of 66 cars, aggregating 1,667,794 pounds.

THE first train on the California Southern railroad for San Diego left the depot at San Bernardino on the 13th inst. The engine was nicely decorated with evergreens, flowers, corn, pumpkins, alfalfa, grapes and a keg of artesian water, while the inside of the engine was decorated with bouquets of flowers.

ANOTHER process of impregnating wood for its preservation has been patented in Germany. This consists in first treating the wood with a solution of zinc vitriol, and then with a solution of chloride of calcium, so that the preservative coating is formed upon the wood by the chemical action of both substances upon one another.

LORD DERBY says the Governments of Great Britain and Germany made treaties with Samoa, which, therefore, forms an independent State, and its annexation to Austria might lead to a violation of international law. The same, he declares, to be true of the other islands.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

MAMMOTH.—*Dispatch*, Sept. 15: One of the richest strikes known in the mining history of California was made at the Nevills, or Mammoth mine, three miles south of this place, last Saturday. A pocket of quartz of almost unparalleled richness was found less than 100 ft from the surface, in which was contained from $75,000 to $100,000, and about two tons in quantity. Much of this might be termed chunks of gold instead of gold bearing quartz. Some of these pieces of solid gold were about as heavy as a man could lift from the ground. The largest piece was an oval 16 by 22 inches and 6 or 7 inches thick. This gold is almost black and of the same character as the former rich strikes found in the same mine. We have no doubt that this is the richest find of gold ever known in the United States at one time. The *Ledger* of Sept. 15 says of this wonderful strike: It completely throws into the shade anything in the history of mining in Amador county, if not in the State. During Friday, a ton of this gold-freighted metal was taken out. It is not so rich as the gold streak taken out some time ago, but there is vastly more of it. The value of this bonanza is estimated at from $50,000 to $100,000. The ledge is five ft wide, and the whole face of it was held together as it were by spikes of solid gold. Altogether, 3,000 pounds have been taken from this bunch of ore, and the end is not yet. The very rich streak, from which this mass of free gold has been taken, ranges from an inch or so up to 20 inches in width. The previous seam varied from the thickness of a knife blade to three inches.

ZEILE MINE.—In the Mint Director's report of this year is the following: The rock is low grade, and assorted in the mine; the best is sent to the mill, the balance thrown aside in the drifts. It is by a careful system of working that the mine is made to pay. The rock only pays $2 per ton in free gold and $5 to $6 per ton in sulphurets, which brings the yield up to a fair average. Attached to the mine are chlorination works, which are kept running day and night, working from 4 to 5 tons of sulphurets every twenty-four hours, yielding large returns.

NOTES.—The clean-up at the Oneida mill running on rock from the Jackson mine, was completed last week. The bullion was taken below, and the men hearing this at once quit work. Nothing is doing at present. The water in the Amador canal is so low that some of the mines are put on short allowance. The Bunker Hill mill has been idle most of the week for want of water. The Keystone mill has been run part of the time by steam for the same reason. Nothing is doing on the Wabash mine. The rich strike lately made has brought one or two adverse claimants to the front.

VOLCANO.—*Dispatch*, Sept. 15: Rich rock is being taken out of Downs mine. Also at the Modoc, on Pioneer creek. Jake Griesback is getting out some very rich rock. It is rumored that the Hadley mine will start up soon. The engine has been repaired.

Calaveras.

INVINCIBLE.—*Mountain Echo*, Sept. 12: The Invincible is making a splendid showing. The vein in the drift now being driven north, is about 9 ft wide, and competent judges say the ore will mill from $30 to $40 per ton. The shaft is about a hundred ft deep.

GOLD HILL.—The Gold Hill mine, on Smith's Flat, owned by George Osborn and Son, is on the west side of a hill 300 or 400 ft in length, and a hundred and fifty ft in height. The mine is opened by a tunnel, for about 200 ft. Rich deposits have been found at intervals for nearly the entire length of the tunnel. While at the mine, we saw them dig out and wash two pans of quartz and fine dirt, which must have contained at least $700, and we were informed that Friday and Saturday, they had extracted from the same place, over $1,300.

MURPHY'S.—*Citizen*, Sept. 15: Sublett & Dodge are at work in the O. K. making preparations to sink deeper on the coarse gold claims, where a year ago they pounded out $50 a day in a hand mortar. In the Red Wing a fine body of rich ore is found at the 100 level, 5 ft wide.

El Dorado.

HENDY MINE.—*Democrat*, Sept. 15: Wm. D. Edwards of the above mine at Nashville, was in town Tuesday, and says they are ready to commence sinking again, having got the mine cleared of water and in tip-top shape. The mill will be started up as soon as sufficient water can be had to operate it. The fine hoisting works put up a few months ago, and which are operated by both water and steam, work to perfection.

Inyo.

MODOCK.—Inyo *Independent*, Sept. 15: Mr. J. J. Gunn, who arrived yesterday from Darwin, reports that Supt. Fitzgerald has made a new strike in the Modock mine, belonging to the company series. It has been opening out well for the past five or six days, and consists of fine 150-ounce silver-lead ore. The furnaces will be started up in about ten days.

STATE RANGE.—M. E. Harmon has been appointed superintendent of the new mines and mill at Reilly, belonging to the Argus Range S. M. Co. It is to be hoped that the company have squared up their financial matters, and if so, Harmon will make an entire success. The mines are very large and rich; the big mill is first-class in every respect, and ready for operations when the builders are paid for it.

Mono.

STANDARD CON.—Bodie *Free Press*, Sept. 12: During the week ending Sept. 8th there were shipped to the mills 1343 tons of ore. The bullion shipment was valued at $19,843.99. The east crosscut, 1200-foot level, was advanced 11 feet; total length 52 feet.

BODIE CON.—During the week 137.485 tons of ore were sent to the mill and 156,025 tons were crushed. The average assay value of the pulp was $21.83 per ton; that of the tailings was $4.27 per ton. The bullion shipment was valued at $7,740.10.

BULWER CON.—The west crosscut from the north drift is in 448 feet. The ground is hard. The south drift from the west crosscut, 500-foot level, was advanced 14 feet during the week; total length 256 feet. The vein is 2 feet wide.

BODIE TUNNEL.—The west crosscut on the 250-foot level was extended 13 feet during the week. The south drift on the 200-foot level was lengthened 9 feet. The assays are higher and the ledge is widening out.

NORTHERN BELLE.—Bodie *Free Press*, Sept. 16: The outturn of the mine for the last fiscal year was 19,574 tons of ore, all of which was milled, together with 504 tons previously mined, yielding $763,930, or $38 per ton. In addition, 5632 tons of ore from the Mt. Diablo was put through one of the mills. Both mills are in good condition. These mills, with the improvements and furnaces, are valued at $358,650, and the hoisting works, etc., at $25,000.

MAY LUNDY.—Homer *Index*, Sept. 15: On the 120-foot level a drift, now 60 north, is in ore that pays under the stamps from $05 to $75 to the ton. About 240 feet further in, or 490 feet from the mouth of the lower tunnel, winze No. 2 was started and is now down 64 feet, following the vein all the way down in good ore. An inspection of this mine will convince any one that the May Lundy is soon to take rank as one of the largest, as of the richest, gold mines.

Mariposa.

BUENA VISTA MINE.—*Herald*, Sept. 14: The work done by the O'Gorman brothers consists of a shaft, located about 60 ft from the old Phebey shaft, which they have sunk to a depth of 82 ft; 25 ft from the surface they struck the lead solid, and still had it when they quit sinking. Not having anything but a windless and bucket to hoist with, a drift was commenced at the new shaft to connect with the Washington tunnel or the east side, and is now in 40 ft. This will ventilate the mine. The work so far shows a vein 8 ft wide, with 4 ft of paying ore, that assays from $30 to $60 per ton.

Nevada.

NOTES. Grass Valley *Tidings*, Sept. 12: Forman Stokes, of the Empire, informs us that the mine is in tip-top condition, that the ore coming out is good and there is enough in sight to insure a long and prosperous career for that oldest mine in the district. The 1200 level at the Idaho is looking first-class. The Magenta Co. are erecting pumping and hoisting machinery. The Mascotte, owned by Charles Robinson and Geo. Murphy, is working night and day, and indications show that a big ledge of quartz is close at hand. The ore improves materially as depth is attained. The Mascotte is suppose to be a continuation of the old Eureka ledge. The water is pumped out of the Imperial mine, and a contract was let to-day for sinking the shaft. The Grey Hound Co. are pushing their tunnel and have a good deal of rock on the dump. Work is going steadily ahead at the Maryland. The New York Hill Co. are driving their drift, and the mine is holding its own. It is stated that the East Eureka (O'Conner) will start up soon. The Powning Co. are down 40 ft and have found new ledge matter, and they expect that 20 ft deeper will disclose the main ledge. Work at the Greeley and Blackman mine is going ahead.

Plumas.

RICH GULCH.—Quincy *National*, Sept. 15: The Hallstead Co. are starting a tunnel to tap their ledge 200 ft deep. Several experts have visited the mine during the past week, and speak highly of it. It is sure that Rich gulch will make a lively quartz mining town.

GOOD CLAIM.—Johnny Riddell tells us that his prospects for a first-class hydraulic mine at Soda Bar are splendid. He had some beautiful gold to show for his work lately.

San Bernardino.

BONANZA KING CON.—Cor. Calico *Print*, Sept. 15: The center of the mine is simply immense. Fourth intermediate is opened 125 ft in the finest ore body I ever saw. In this drift and winze I can show any man $200,000. I can take out $10,000 a day with 8 or 10 men. The dumps contain half a million dollars. The ore house at mine, the ore bin at mill are all full. The mill run but 20¾ days for August, produced $44,500. The mill is now producing $2,180 per day. Ten stamps, dry crushing—a record never equaled anywhere. Total product for year so far is $444,820. I predict three-fourths of a million for 1883.

EXCHEQUER DISTRICT.—From Higgins & Co.'s claim some very fine ore has been taken and from assays made they claim to have three tons of ore out that will average $600 a ton. The float which led to the discovery of these mines assayed, from reliable authorities, $5,665.50 per ton. Parties are coming in here from all directions. New locations are made every day and everybody thinks he had struck it rich. The croppings show up well and there will be developments made that will astonish you as soon as facilities are obtained to go on with the work of prospecting.

Sierra.

GIBSONVILLE.—Downieville *Tribune*, Sept. 13 The existence of a back gravel channel was demonstrated by the Bootjack claim. This company after working out their front ground pushed ahead the main tunnel until a back channel was reached, where splendid paying gravel was found. The tunnel proved to be a little high, however. To successfully work the mine a tunnel lower than the present one will have to be run. This work, it is estimated, would cost $100,000. The Union Co., at Mount Pleasant, are now encountering the same difficulty. Lately they struck the back channel and found the tunnel two high. At present they are working through an incline. The gravel is very rich, but the company keep pumps running constantly. The Pilot Peak Co. are running for the same lead. They have already run a tunnel into the ridge over 3,000 ft., through hard rock. Five or six hundred ft further will carry the tunnel into the center of the ridge and on a line with the channel. But owing to lack of capital, they are at present at a standstill.

FOREST CITY.—One hundred and eleven ounces of gold was taken out of the South Fork mine, at Forest City, last week by the Bald Mountain Extension Company.

NOTES.—*Messenger*, Sept. 15: The Home Stake Co. are raising for gravel. They will have to go up 15 or 20 ft before reaching the pay lead. At Red Oak gravel mine, adjoining the Grand Prize, the tunnel is in 146 ft, through blue slate that blasts well. John Mason, superintendent. The differences be-

tween the Ruby Co. and Mr. Kennedy have been settled.

Tuolumne

SOULSBYVILLE. *Independent* Sept. 15. The new hoisting works on the Lamphier mine will be completed in one week. Mr. Kirkwood of Soulsbyville is putting up the engine. Capt. Bolter and James Pooley have a mine below town. Some gold can be seen in the rock and some looks splendid. Many expect the mine will soon be sold for several thousand dollars. They have a shaft started and one to the great depth of ten feet, more or less. The Soulsby mine is looking better than for months past. They are taking splendid rock from the levels. It is reported that the Louisiana mine has shut down, and the Supt. is putting in condition the Sulphuret works at Soulsbyville preparatory to working material from the Black Oak and other mines.

RISING SUN. *Sonora Democrat*, Sept. 15: Chas. Lang and Capt. Woodworth have ordered the machinery for a five stamp mill, to be erected on the Rising Sun mine, at Cherokee, and it is expected to have the mill ready for operation about the 20th of October.

RIVER MINING.—L. J. Lewis has several gangs of men at work in a race on the Stanislaus river, below Robinson's ferry, setting sluices and pumping with two Large Chinese pumps, run by an overshot wheel 16 ft in diameter, and otherwise getting ready to work a large section of the river.

Trinity

BLAKEMORE. —*Journal*, Sept. 15. From T. J. Blakemore, who was in town last week, we learned that they went down on the ledge a distance of 60 ft, and at that depth the ledge showed 6 ft wide. The rock is variously estimated at from $50 to $150 to the ton and those who should be good judges say it will average $100.

BULLYHOOP.—The ledge in the Bullyhoop shaft is now four ft in width, showing free gold all through one foot of the thickness being very rich. They are still sinking on it with every indication favorable.

EAST FORK QUARTZ.—Moor, Day & Hubbard have the ditch to their arastra completed and will soon commence crushing. The rock is very rich. We hear that Jas. Kelley found a very promising new lode in Deadwood last week, and another party discovered some rich veins of quartz on Rush creek.

NEVADA.

Washoe District.

HALE AND NORCROSS. *Enterprise*, Sept. 15: The enlarging on the branch drift to the winze on the 2600 level not only helps the ventilation, but also gives more room for working. The winze is down 110 ft on the stope, and the ore streaks hold out in width and strength. They will soon reach the 2700 level, when crosscutting will be run both east and west.

UNION CON.—The south drift on the 3000 level is cutting through streaks of metal-bearing quartz. The joint Sierra Nevada winze below the 3000 level is down 70 ft. The indications here, as well as on the west side, are that the vein is straightening up.

SIERRA NEVADA.—The main north drift on the 2600 level is pushed ahead rapidly. It will open up a large area of ground. On the 3000 level the joint Union Con. winze is down 70 ft.

MEXICAN. The ground at the top of the upraise from the 2900 level is still very hard and progress slow, as the workmen are much discommoded by the hot water that falls from over head. The winze down from the 2700 level, which this raise is to meet, is draining out very slowly.

GOULD AND CURRY.—Good headway is making in east crosscut No. 3, which now seems to be entering upon the edge of the large vein of quartz cut across in crosscut No. 2. It is thought that this vein will be found wider and stronger in going south.

NORTH GOULD AND CURRY.—Sinking is progressing favorably in vein porphyry which shows streaks of clay and stringers of quartz.

ALTA.—Excellent progress is making in draining the mine. They will in a few days have the 1450 level drained, which will leave but 700 ft to be pumped out.

IMPERIAL. The work of putting in order the hoisting machinery progresses well.

BELCHER.—The ore dumps are all full, and are awaiting the starting up of the mills on the Carson river, which, it is now said, will be in about two weeks.

SCORPION.—The west crosscut on the 500 level is passing through ground that shows occassional streaks of clay and quartz. Some water is encountered.

YELLOW JACKET.—About the only work being done at present is on the Sagebrush level, whence some ore is being extracted.

OPHIR. On the 150 level good progress is making in the two west drifts. A considerable amount of ore is being extracted from the croppings.

CON. VIRGINIA.—The usual progress is making in the south drift on the 2700 level. A chamber is being cut for No. 2 winze joint with California.

ANDES.—The west drift is still finding quartz of a promising character.

CROWN POINT.—Active mining will be resumed in two or three weeks, or as soon as the river mills can receive and reduce the ore.

SAVAGE.—Work will probably soon be resumed in the drift on the 2600 level.

CHOLLAR.—Prospecting will not be resumed until the new hydraulic pump goes into operation.

CALIFORNIA.—A chamber is being cut out for winze No. 2, joint with Con Virginia.

SOLID SILVER.—Are clearing away debris and putting in shape the mouth of the tunnel.

BEST AND BELCHER.—The north drift on the 2500 level is still being allowed to drain out.

UNION SHAFT.—Are still cutting out behind and easing timbers at the 2300.

OVERMAN.—Some ore is being extracted from the old upper levels.

UTAH.—Are advancing the north drift on the 1300 level.

Belmont District.

NOTES.—*Courier*, Sept. 8: Work progresses finely in the Jefferson mines, and the mill is still running. The Tybo mill is running constantly and is producing very fine bullion. Good ore is extracted daily from the Belmont mine.

Limestone District.

A NEW CAMP.—*Silver State*, Sept. 10: Very favorable reports are received from Limestone district, which is a new camp south of Beowawe. A Philadelphia company have let a contract to sink a shaft 100 feet deep on an extension of the Limestone No. 1, which is owned principally by railroad men. The original location on the Limestone lead has been prospected to a depth of 100 feet by a shaft. The lead shows ten inches of galena ore that assays over $100 to the ton in silver and carries 60 per cent of lead from the sagebrush roots down. In sinking the shaft some 25 tons of ore was extracted that will pay the expenses incurred in prospecting the mine. Limestone district adjoins Bullion, where a new ten-stamp mill and smelters are being erected.

Pinto District.

SILVERADO.—Eureka *Sentinel*, Sept. 11: We have it upon reliable authority, that on the 400 level of the Silverado Co.'s mine there are fine seams, which give promise of leading to bodies of good pay ore. A shipment of 120 tons of $100 ore was made to Eureka yesterday. The mine is worked on the principle that it must pay its own expenses. The Fair Play is looking better than ever. The recent strike is showing up richer all the time. The working force was yesterday increased to nine men. The Queen mine is not panning out very big just now, but the Jones brothers are following good indications and sanguine of striking it rich again.

Ploche District.

EL DORADO NEWS. *Record*, Sept. 8: From Andy Fife, who arrived from El Dorado canyon on Tuesday, we gather the following: The Southwestern Co.'s mill is running, and will continue to run all next winter, as they have enough ore to keep them a going. The Co. has made a contract with Fife to furnish them with 1,000 cords of wood. The chloriders, owing to the hot weather, have all quit work for some time and are rusticating at the Vegas ranch, having a jolly time drinking wine. Tons and tons of peaches are going to rot at the ranch. The ground is covered with them.

BULLIONVILLE.—The Smelting Co., after a month's trial, have found it impossible to work a portion of the Day ore, and have abandoned the project. The ore contains a large percentage of white iron, which forms a mush in the furnace that has to be raked out repeatedly, as no flux will reduce it to a slag state. Poujade had thirteen tons of ore worked at the furnace during the week that sampled over $200 per ton.

White Pine District.

HAMILTON.—*News*, Sept. 8: There is a prospect of some work being done this fall near what was once known as Carbonate City, 1½ miles above Swansea. Should there be furnaces again built here, there is reason to believe this will become one of the most promising parts of this district. Among the mines there are the Miser's Dream, owned by Mau, Heitman and Stede; the Mother Lodge and the Rocco, owned by Rocco Kraniaz. Rocco has done considerable labor this summer on the mines owned by him, and they present a marked improvement.

A NICE LITTLE MINE.—Fred. Gotchett showed us a few days ago two beautiful specimens of gold quartz, taken from his mine in Granite district, just across the range from Burgett's. They were literally lousy with gold, and a ton of such ore would make a man rich. Mr. Gotchett has a small two-stamp mill in Telegraph canyon. When he gets out a little fore he crushes it himself, and thus manages to make both ends meet.

ARIZONA.

DOSORIS.—Prescott *Miner*, Sept. 7: Mr. P. C. Craigue, of this property, informs the *Miner* that he is finding good ore in the bottom of a shaft down nearly 300 ft. The mine is pretty thoroughly prospected. Thus far the mine has shown mineral all through and the proceeds have paid all expenses.

COCHISE COUNTY.—Prescott *Miner*, Sept. 8: The smelting people refuse to handle ores which yield less than $100 per ton.

MARICOPA.—The Vulture has yielded wagon loads of gold. A large mill is in operation. The ore is not so rich as formerly and it is nip and tuck to make it pay.

YAVAPAI.—We now have the United Verde Co.'s 30 ton smelter running out a great deal of silver and copper, the Howell Reduction Works making bullion by the ton, and the Black Warrior mill. The Peck mill will soon be started.

PIMA.—Pima county has five out of a hundred stamps running. She is going to try smelters. The Copper Queen mine, Bisbee, has paid $900,000 in dividends.

PINAL SUMMARY. *Drill*, Sept. 8: We have been through the Silver King mine and will tell what we saw in our next issue. The mine is grand, more of a wonder than ever. The Frankfort, one mile north of Silver King, is down over 40 ft. It is the same general character as Silver King ore. The ore now reached in the Eureka is low grade, but there is plenty of it. They had some small quantity assaying $2,600. The winze in the Australia on the Continental ledge is 50 ft deep. The vein is unbroken from the top 80 ft. In the bottom the mineral is 20 inches wide. Assays, 17 per cent copper, 44 per cent galena, $15.37 silver per ton. They will now sink on the vein, and then drift into the mountain. The Blue Bird, the property of Thomas Farrel, near Martinez canyon, Belle Air, is ascertained to extend 150 ft in width. It adjoins the Martinez. The mineral vein on which work is done, is 16 ft wide. The iron capping all carries galena. The mine lays right across the great wagon road from Belle Air to Butte and is most accessible.

MINERAL CREEK MINES.—In the Ray, Scorpion and Bilk are fifty men employed and the camp is lively. A large quantity of native copper is on the dumps. The Congress and Gap mines show an ore body 820 ft wide and 1,000 ft long, prospected with 30 holes and cuts, each from 5 to 25 ft deep, all in ore, carrying from 5 to 40 per cent copper and $20 in silver. The formation is slate and lime-rock with syenite and quartz. Westerly from the Gap is the Star. This has a working shaft of 65 ft and a crosscut of 16 ft; and a tunnel of 120 ft, with crosscut of 50 ft. There is 4,000 tons of ore on the dumps assaying from 10 to 100 dollars per ton, besides 40 tons of black sulphurets and native silver assaying $300 per ton. Some specimens on the dump go from $15,000 to $20,000.

WALLAPAI MOUNTAINS.—*Alta, Arizona*, Sept. 1 From the Tertio mine at the depth of eighteen feet, a fifty pound sample was found to contain 84 ozs. in silver per ton, vein averaging two feet in width. The Blucher lode at a depth of 12 ft sampled 85 ozs. in silver. The Wallapai Queen from a two-inch pay streak at the surface at the depth of eight feet, developed into a two foot vein interspersed with sheets of antimonial silver assaying 368 ozs. in silver and $18 in gold per ton.

OLD DOMINION.—*Silver Belt*, Sept. 1. Shipments from Old Dominion for the week, 327 bars—103,940 pounds. Total shipments, 4,224,820 pounds. Product for August, with one furnace, 403,810 lbs. Beat this who can. The bullion now produced is 99 fine.

COLORADO.

SAN MIGUEL MINES. Cor. Denver *Tribune*, Sept. 5: Reports of a strike of immense value at Mount Wilson have been circulating at Rico for a couple of weeks. * * * The first property we saw was the European lode on the east side of Monitor mountain. It has an open cut which exposes a vein of 4 ft between walls. A streak five inches wide of solid galena cuts through the vein and may be traced 50 ft up the cliff. Fifty ft below the cut a tunnel has been started showing the same sized vein and streak. * * * Next we visited the Sunlight and Magpie lodes. These are the claims reputed rich, which caused the trip. They are on the northern slope of Monitor mountain. In the Magpie the vein is 300 feet wide, but the formation is very much shaken. The cut of the Sunlight is 100 ft to the east and shows a vein four feet wide, at right angles with the cut. It is composed of streaks of white iron, antimonial silver, decomposed lead and oxide of iron. In the face is a solid body of white iron and antimonial silver. Several mill runs have been had on each of the streaks, the lowest resulting in 104 ounces and the highest in 560 ounces silver. All in all, I have seen no more promising prospect than these claims show at their present stage of development. About a ton of ore has been sacked for shipment. The men were busy building cabins and forges.

RUBY CAMP.—Correspondent of Denver *Tribune*: Our camp shows more activity than at any other period since its discovery. Machinery is in working order in all of our prominent mines. Our concentrators and sampling works are kept running day and night, and the amount of ore shipped will not fall short of $35,000 a week. This is not inconsiderable when it is considered that the amount shipped is produced only in development work.

THE BULLION KING.—The Bullion King has its machinery in place. The shaft is already 120 ft deep, with a south and north drift 150 and 60 ft. The shaft is 4½ by 9 ft inside of timbers, is cribbed the entire depth with hewn timbers and divided into two compartments. The mine has already shipped $60,000 worth of ore, and has on the platform 150 tons of concentrating ore, which runs 40 ounces.

THE RUBY CHIEF.—The Ruby Chief tunnel is driven 197 ft and will be extended 300 ft further. The company has shipped $25,000 of ore and has at least 100 tons of 45 ounce ore on the dump which is being hauled to our local mills. The tunnel follows the course of the vein for 120 ft.

LULU.—Although the mines are in their infancy, developments show them to be rich. About three years ago the mineral was discovered. It has been the prospectors who have developed the camp. The park is somewhat isolated, being 100 miles from Georgetown and 70 miles from Fort Collins, over mountain roads. The park is on the Grand river. Next is Lead mountain, upon which are some of the best mines in Colorado. The Lead Mountain Co. own a group of 10 mines. Among them are the Eureka, Bonanza No. 1 and 2, Snow Flake and Carbonate. All these have a well defined vein of galena and are so located that they are easily worked. The Eureka has a tunnel in 100 ft and has a large and rich body of ore, there being a 6-ft vein of the carbonate, having about 500 ft of tunneling and shafting. Assays from surface rock run up in the hundreds. This is one of the richest companies in the West.

IDAHO.

BULLION CAMP.—Wood River *Times*, Sept. 5: The Jay Gould concentrating works were started up Saturday, and the Idahoan works will soon be. When these get to running there will be four concentrators in operation at Bullion, to wit: Those of the Mayflower, Jay Gould, Bullion, and Idahoan mines. Then the yield of Bullion camp should be 50 tons. This can be kept up all winter, as the mines are in splendid condition, with large reserves of ore in sight and the development work far ahead of present need. The Mayflower mine is making a splendid record. During the past five months it has yielded $50,000 per month, and by the end of this month (September) it will have reimbursed its present owners every cent that it has cost them ($375,000, besides working expenses for a year and a half).

SAWTOOTH AND VIENNA.—Col. Brodhead says that Vienna and Sawtooth district was now producing about 50 tons of ore per day, and would keep up this average until snow put a stop to hauling. The Columbia & Beaver Co.'s mill, Colonel Brodhead said, would probably start up on the 5th. The lixiviating process would be a success.

SMOKY BULLION.—A miner just in from Smoky reports that day before yesterday, some very rich ore was struck in the main tunnel of the Smoky Bullion mine. "It is the prettiest ore I ever saw!" he exclaimed to a *Times* reporter, and added: "It'll go $4,000 or $5,000 per ton."

BULLWHACKER.—An experimental run of Bullwhacker ore was made yesterday at E. Daft's assay office. A sample of 15 pounds was put through the furnace. The result was two bars of base bullion weighing seven pounds, and assaying at the rate of 290 ounces of silver per ton. This, reckoning the lead at 60 per cent, would indicate a total value of about $340 per ton. The ore was not specially selected.

MODOC.—Ketchum *Keystone*, Sept. 5: John Foster & Co., proprietors of this mine, fifteen miles above Ketchum, have sold fifteen tons of ore to the P. M. & S. Co., from which they realized over $3,200, after paying all expenses of mining and transportation. Mr. Foster informed us that one man extracted the ore in fifteen days, and that one ton of the high grade ore paid all expenses.

ELKHORN. *World*, Sept. 4. Hugh Turner has struck a 20 inch vein of very good ore in the old Elkhorn mine, which was worked about eighteen years ago and yielded immensely. After digging out the pay chute, work stopped. Since then a good deal of work has been done in the way of drifting and tunnelling for another pay chute, and Hugh Turner was lucky enough to strike it.

MONTANA.

BOZEMAN.—*Inter Mountain*, Sept. 3: The water-jacket smelter being erected at Cooke city to treat the ores of the Great Republic and other mines owned by the company represented by Major Geo. O. Eaton will have a capacity of 40 tons. The Eastern Montana M. & S. Co.'s smelter has started up on custom rock. It is under lease to the Wills M. & S. Co. There are good leads in the camp, but there is too little development. Where men can find ore near the surface with an assay value of from $70 to $20,000 per ton, it would seem they should proceed to open the mine. This, with the exception of the Eaton mines, has not been done. Possibly they may not have had means to open their properties. Now, however, they can dispose of their ores to a company prepared to work them.

FISH CREEK. The mines in the vicinity of Fish creek are fast coming into prominence. The Maggie is making shipments of ore to Glendale with satisfactory results. This claim is developed by three tunnels, one of which taps the vein at 1,700 ft, and at that point the ore body is of a good width and assays 115 ounces.

NOTES.—Butte *Miner*, Sept. 5: The bullion shipments during the week, amounted to $91,886; credited as follows: Alice, $24,208; Donnel, Clark & Larabie, $14,408; First National bank, $16,330. The Bell smelter closed yesterday for repairs. The concentrators and calcining furnaces are kept running and the blast will be started up again next Wednesday. The 400-ft north crosscut in the Bell mine has advanced 142 ft and is in vein matter. Ore is being hoisted from the old workings through the 270-ft crosscut from the new shaft. The Wild Bill shaft has a depth of 60 ft on the ledge, which continues to look well. W. A. Clark has purchased S. E. Larabie's interest in the Travolna mine in which the first discovery of silver in Summit Valley district was made by William Farlin in 1875. It is believed to be a big mine yet. The center shaft at the Neptune is down 40 ft. Some good ore is being extracted from the old shaft. The west workings and the winze from the 300 S. W. at the Moulton are producing their usual high grade ore. At the Original, the new east shaft is down 75 ft. Some fine ore is being extracted from the stopes of the east and west 300. A large Knowles pump, is being erected on the 400. The developments at Clark's Fraction, which lies between the Alice and Magna Charta, continues to demonstrate the value of the old Rainbow lode. A drift has been run from the east 300 of the Alice, which has reached a point directly beneath the 80 ft workings, and a 3 ft ledge of high grade ore has been uncovered. The assays average 160 ounces and several samples went from 230 to 530 ounces. The drift will be run through the fraction 221 to the Magna Charta line, when crossentting and upraising on the ledge will be commenced. The principal work at the Shonbar just now is sinking the shaft for 300, 400 and 500 levels. An additional pump has been put in at the 230. The stopes of the 230 east drift are looking well and high grade ore is being extracted.

TIDAL WAVE DISTRICT. Ten men are at work on the smelter going up on Wisconsin gulch, and capitalists from Salt Lake and California are looking over the district. The gold mill is having a steady run on ore from the Two Dans and Melrose leads. The first day's run cleaned up over one pound of gold. Everything seems lively and prospectors are striking new leads daily. Ore can be found in this camp that assays as high as $7,000 per ton.

BOWLDER VALLEY.—The ore in the Baltimore is free milling, and there is over 100 tons on the dump. The Chillicothe is turning out silver lead ore, assaying as high as 300 ounces per ton. The shaft is 30 ft deep. The Mono has been retimbered. The Amazon is opened by a shaft 160 ft deep, and is full of promise.

NEW MEXICO.

CLIFTON.—*Southwest Sentinel*, Sept. 5: Mose Stevens, who is in from Clifton, reports rich silver discoveries, 6 or 7 miles north of town. He shows rich samples of ore, and states that the leads are said to be quite extensive. As yet the discoverers only know of the precise location of the find.

OREGON.

MINING NOTES.—Jacksonville *Times*, Sept. 7: Wm. Dorn, who is mining on Elliott creek, just across the State line, says that there are fewer miners there than usual, but all seem to be doing fairly. R. Cook, who has been putting the Roten ledge in Willow Springs precinct in shape for Ross, Dolsen & Co., says there is a well-defined vein of quartz. The Elk Head cinnabar mine in Douglas county is working with good results. It is so arranged that they can take out the ore from the condensers each day, and it averages 50 pounds. Bilger & Magly are manufacturing hydraulic pipe for Logg & McDonnell, who have extensive mines on Forest creek. Jas. Hansen will prospect the Blue Gravel mines at Galice creek this season by drifts, hoping to find the pay streak again.

UTAH.

EMMA. Salt Lake *Tribune*, Sept. 15: The Emma mine at Alta is looking splendid. It will be remembered that work is being done on it through the Bay City tunnel, which has its heading 1,700 ft from the mouth, from which point a shaft has been sunk 200 ft. On the vein drifting has been done both east and west. These drifts are 200 ft vertically below the old workings of the mine, from which so much wealth was taken a few years ago. Ore is being taken out but most of the work is being done for the purpose of developing. The shaft is to be sunk 200 ft deeper, where it is expected to cut the vein at a point 550 ft vertically below the old workings and 800 ft on the dip of the vein. Twenty-eight men are employed.

Iron Stone and Terra Cotta Pipe, etc., for all Purposes.

The manufacture of iron stone pipe for purposes of drainage, irrigation, sewerage water carriage and the like, and the manufacture of terra cotta work for chimneys, for architectural decoration, and for a thousand other uses, is one of the great industries of the country, and is most intimately connected with the health, comfort and convenience of the people. A little idea of the extent of the business may be gained from the fact that for the one purpose of farm drainage there was manufactured in the United States during 1882 about five and one-half million dollars' worth of drain tile. This is one of the most humble uses to which earthen pipe is put, and affords only an inkling to the extent of the production which includes the higher class of goods required for sewerage water carriage and for ornamental purposes. The Pacific coast figures creditably in the production of iron stone and terra cotta materials in proportion to its population. The leading manufactory is that of

Gladding, McBean & Co.,

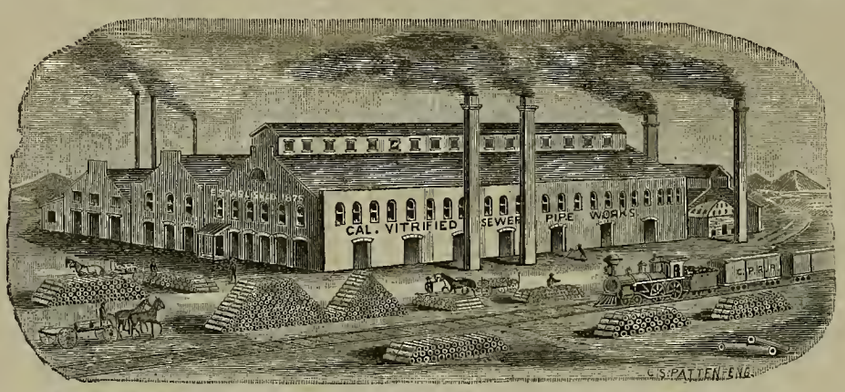
Which is situated at Lincoln, Placer county, California. The works, of which a sketch is given (3d page), comprise buildings covering an area of 160x230 feet, partly two and partly three story structures. One, just finished, is of brick, 85x230 feet, and is handsomer than one shown in the engraving. The establishment was started in 1875, and has been enlarged continually until the present time, and now has two acres of floor room inclosed. The power is furnished by a 60-horse power engine, driven by two boilers. There is the best machinery for the purposes designed, including a steam sewer-pipe press, clay mills, and tile mills, all run by steam. There are five down draft kilns. The works are made accessible to the cars by 1,500 feet of side-tracks from the main line of the Oregon division of the C. P. R. R., and the site is 11 miles from the junction of the C. P. and Oregon railroads, and 28 miles from Sacramento. The vein of clay is 30 feet thick and of first quality, which justifies the liberal expenditure for manufacturing facilities. There are 75 men employed, and the output of the factory is immense, and goes to all parts of the coast. The main office is at 1310 to 1316 Market street, San Francisco, near the new City Hall, and the firm has agencies all through the Pacific coast towns.

The Products.

Space will not permit us even to enumerate all the varied and useful forms into which clay is made in this large establishment. Indeed, it is not necessary, for the firm issues a handsome illustrated catalogue which gives all necessary information. But we shall allude briefly to some of the manufactures which seem to us of chief interest. First, there is vitrified iron stone sewer pipe, which renders it perfectly impervious to moisture. This pipe makes the perfect conduit for house or street sewerage, which is essential to health and comfort. It is made in all sizes, and with all curves, traps, etc., which may be desired. No one should take the risk of contaminating his well or vitiating the air of his habitation by using a leaky sewer pipe of stone or brick or wood, when a perfectly tight and durable pipe can be obtained at such a reasonable figure as it is now offered at.

For the conduct of water from a distant source nothing can be more wholesome than a clean stone pipe, and in no other way can a large body of water be delivered so cheaply. Well laid, this pipe will stand a pressure or head of sixty feet, and the material should be examined by those who contemplate bringing water long distances for house use or irrigation. It is well understood that irrigators in some parts of the State will have to resort to piping, as the open ditch is so wasteful by evaporation and seepage. Miles and miles of water pipe are being put in this year in San Bernardino county.

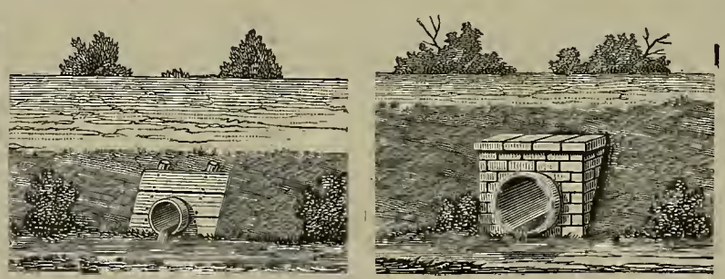
Stone pipes make most excellent culverts for roads or railroads. They are easily made, neat and serviceable, and so durable that the use of planks for small road-culverts should be laid aside where the pipe can be had. The engravings on this page show how neatly a culvert can be made with pipe.



Drainage and sub-irrigation are twin benefits, and for these purposes there is a constantly increasing demand for stone pipe. These pipes or tile are manufactured without sockets or collars, in one-foot lengths, and are laid in the trench with their ends joined as closely as possible. If to be used for drainage, the water will enter where the ends of the tile meet; and if for irrigation, it will escape at the same points. It is shown by statistics that 52,647 miles of tile drains were laid in the United States last year. California has not done as much in under-draining as she should, but there is now a disposition to wise expenditure in this direction, for it has been shown that well drained land is an advantage even in a dry country like ours. Of course some fields are naturally drained by condition of soil, etc., but there are many fields which need tiling.

The fine quality of the fire clay found at Lincoln, not only enables Gladding, McBean & Co. to turn out their fine goods, but the clay in itself is much sought for in the market for fire-brick work of all kinds where heat resisting quality is desirable. The Lincoln fire clay is sent all over the coast for these purposes.

Terra cotta chimney pipe is one of the finest modern discoveries and makes building easy even where brick is not to be had. The terra cotta chimney takes little room. They are cheap, light, easily put up, they do not clog with soot—in fact, so desirable is terra cotta in this respect, that large quantities of terra cotta lining for brick chimneys is sold. Terra cotta chimneys are claimed to be safer than brick if the pipe is well cemented. These chimneys are of different sizes and the terra cotta chimney tops are made in a great variety of handsome forms, so that they are regarded as fit for our finest structures as well as for our cottages. Gladding, McBean & Co.'s catalogue is very full on the subject of terra cotta chimney work, and should be consulted by house builders.



Another interesting branch of manufacture at Lincoln is flower-pots, plain and ornamental, garden vases, hanging baskets, wall pots and fern cases, and everything of that kind to delight the amateur or professional florist and gardener.

We have not space to examine these interests farther at this time, but those who feel inclined have the privilege of doing as we did—call and examine the samples of manufacture at the large yard near the New City Hall in this city, or send for the illustrated publications of the firm, just issued.

ESTABLISHMENT OF GLADDING, McBEAN & CO., LINCOLN, PLACER CO., CAL.

HARRISON J. MCKUSICK, Superintendent of the Railway Mail Service of the Pacific coast, has gone to Reno and Mound House station, the northern terminus of the Carson and Colorado railroad, to set mail service cars in operation on that road. This arrangement is one of the successes achieved by Mr. McKusick at the recent conference of mail service managers in Washington, D. C. Three cars will at first be put on, with the usual corps of clerks. They will run from Mound House to Hawley's, a station not far from Independence, Inyo county, a distance of about 200 miles, and will supply quick mail facilities for a large district heretofore comparatively isolated in that regard, being supplied only by stages over long routes. The mails for Inyo county and some districts south, that went formerly by stage from Mojave, will now be sent by the overland train to Reno, thence to Virginia City and Mound House.

METHOD OF MAKING SEWER PIPE CULVERTS.

A NEW YORK lumber dealer recently imported from the Pyrenees a walnut log which is twelve feet long and nine feet in diameter, and weighs 22,000 pounds. It is estimated to be worth $2,000 as it lies, and when it is sawed into veneering it will yield 66,000 feet, which will be worth $5,000.

THREE miners named Timby, Minnes and Littlejohn were coming out of the 500-foot shaft of the Gagnon mine, at Butte, last Friday. When 300 feet from the bottom the cage broke, and the miners fell backward and were crushed into an almost unrecognizable mass.

TENNESSEE is making progress in the development of its coal and iron mines.

IT is estimated that about 800,000 freight cars are in use in this country.

Cassiterite, Spodumene and Beryl in the Black Hills.

Cassiterite is found in place and in stream deposits in the central regions of the Black Hills, Dakota, about two miles from Harney, in Pennington county. This tin ore occurs in a vein, or mass, of coarsely crystalline granite rising through the fine-grained micaceous and siliceous slates of the Huronian period flanking the granite axis of the Harney range of mountains.

At the principal point of discovery, known as the Etta claim, the feldspar quartz and mica are in unusually large crystals. Some of the cleavage blocks of feldspar measure from twelve to twenty inches across, and the mica crystals have yielded sheets of commercial value. In addition to these minerals, there is an abundance of spodumene in gigantic crystals, ranging from two to six feet in length, and from eight to twenty inches in diameter. The first masses of tin ore found were imbedded in the midst of the crystals of spodumene and of feldspar, and yielded fragments of nearly pure cassiterite weighing from one to fifty pounds and more. The chief associate or gangue of the tin ore is, however, a dense aggregation of small crystals of mica, of a light yellow color, forming irregular veins and bunches in the midst of the granitic mass. In this micaceous rock, formed of the mica with a white spar, apparently albite, the tin ore is disseminated in grains from the size of a mustard seed to the size of peas, and sometimes an inch in diameter. These grains are irregular in form; no perfect crystals have yet been found. They can be easily separated from the mica by crushing and washing. The ore appears to be very clean; no wolfram has yet been found with it in the mica, but a few crystals of a black mineral, believed to be wolframite, have been seen in the mixture of spodumene and feldspar. No topaz has yet been identified.

At another locality, where large plates of muscovite mica have been mined, I have found beryls in large crystals, imbedded in a matrix of quartz, resembling the beryls found in the mica mines of Acworth, New Hampshire, though not so large.—*Wm. P. Blake, in American Journal of Science.*

PAPER ROOFING.—A Mansfield, Ohio, company are manufacturing a roofing material from wood-pulp board consisting of two-thirds spruce and one-third poplar. It is then prepared, under patents owned exclusively by the company, in such a manner as to give the greatest durability, and adapt it generally for roofing purposes. It is claimed to be the best roofing in the world, all things considered. It is not affected by heat or cold, as metallic roofs are, nor can it corrode. It is much lighter than slate, weighing only about 50 pounds to the square, and can be walked upon without injury. It is practically fireproof, though not absolutely non-combustible. It can be used on any kind of a roof having not less than 1½ inch fall to the foot. It is especially adapted to locations where smoke and sulphurous gases abound, which generally destroy metallic roofs in a short time. It is flexible, and can be used for valleys, flashings, ornamental cut-work in gables, panels, bay windows, verandas, and irregular-shaped roofs. It can also be used with perfect success for sheathing warehouses and grain-elevators.

Population of Montana.

Montana must have assimilative powers superior to any thing recorded in the history of the nations, if she succeeds in making a homogeneous population out of the unnumbered varieties of races, peoples, and tribes which are pouring into our Territory. No commonwealth has ever before undertaken to harmonize and make congruous so heterogeneous a population.

Of Indians, we have Crows, Piegans, Gros Ventres, Flat Heads, Bannacks, and remnants of several other tribes. Of Mongolians, there are Chinese, Japanese, and Laps. The Shemites are represented by Jews and Arabs. Africa sends us Cops, Congoes, Moors, and Caffers. The Aryans are represented by Pilgrims, Norwegians, Russians, Poles, Swedes, Danes, Austrians, Hungarians, Prussians, Dutch, Swiss, Italians, French, Canadian French, and Halfbreeds, Spaniards, Spanish Americans, and Peons, English Canadian English, and Halfbreed English, Scotch and Irish, Mennonites and Mormons.

But the most discouraging feature of this gathering of races and people, is the fact that there is a majority of no one nationality. If we had a majority of Anglo-Americans, of Englishmen, of Frenchmen, or of Germans, we might hope that such a majority would so assimilate all the others as to make a harmonious if not a homogeneous people. But with every nationality largely in the minority, and with so many conflicting civilizations, clashing religions, and national and social customs, it will be almost impossible to avoid most irritating frictions and deadly feuds. The first immigrations into Montana were less heterogeneous, and the Anglo-Americans and Irish-Americans, and German-Americans, largely assimilated in the States, had a vast majority of the whole population, and after a rapid but somewhat destructive fermentation of the conflicting elements, the result was a population similar to the populations of the Northwestern States whilom so called. But there were several circumstances which greatly hastened this happy result.

The early settlers of Montana found themselves in the midst of savage and hostile tribes, and more than a thousand miles from any civilized people to whom they could look for efficient succor, and the necessity for self-defense in this isolated condition, drew them together as with bands of steel.

Probably there never was a frontier people in which there was so large a proportion of first-class, well educated and well disposed men as were found in the early mining camps of Montana, and these men in their organizations for defense against external savage foes, and still more savage road agents and gambling roughs, learned to appreciate each other's good qualities, and to work together in establishing the regular machinery of civil government and social progress. These facts rendered the assimilation of conflicting elements a short and easy work, and the result was one of the best populations of the continent.

Then came the Utah & Northern and poured into our southwestern towns and camps the restless, lawless crowds which ever follow the progress of all railroads penetrating unsettled regions. And now comes the Northern Pacific rushing in from the east an eager multitude of all the conflicting elements of Canada and Europe, and from the west the mongrel hordes of Asia and the Pacific Islands, stirring society to its very dregs.

What will be the result of this new fermentation no one can tell; but every anthropologist and every patriot will watch the struggling civilizations, and mark well the results. Montana is now working out the most complicated social problem of the ages. It is our belief, however, that the various civilizing and enlightening agencies at work in our midst will produce a homogeneous people worthy of the grand country we possess.—*Helena Independent.*

THE CHENEY COAL MINE.—It would seem as if nature was extravagantly prodigal in her mineral bounties to Southern California. She has been more than lavish in her distribution of the precious metals, and recent developments indicate that she has been equally liberal to the southern section of the State with the equally valuable useful metals. To keep time with the great silver discoveries in Calico, an equally promising gold discovery was made six miles from Pinacate, thirty miles from Colton, and four and a half miles west from the C. S. Railroad, to which from the mine a splendid road has been furnished by one of nature's road-masters, who often do their work to endure. The vein struck is six and a half feet in width, and the prospects are excellent that it extends at least one and a fourth miles in length. The country is a "level flat," the access all that could be desired, the facilities for development excellent. A tunnel has been run along the vein of 170 feet in length, and the "ledge" not only retains its full width, but is slowly enlarging, while the coal gets harder, finer and in every feature better. In going down, clay strata are struck, which, according to coal mining experts, point strongly to the existence of very wide coal seams below,

THE ENGINEER.

Modern Steamers.

The *Nautical Magazine* remarks that there is one thing that we know, or should have learned from the vast experience of the last ten or twenty years—an experience, perhaps, as gloomy and unsatisfactory as it has been rash—that the majority of "cargo steamers" as at present constructed and sent to sea, have already—long since—reached the limit of safety in loading; if, indeed, many of them have not got much beyond it. If this be not so, how are we to account for the great number of such vessels which annually disappear? There is surely unmistakable evidence to prove that something is wrong somewhere, for many of them are comparatively new ships. After two long centuries of experience of all kinds of ships, and over all seas, a vanished school of able and sagacious seamen laid it down that a good ship, fairly loaded and ably commanded, will live in any storm, excepting, perhaps, cyclones and hurricanes, and the accidents which they engender; she positively cannot sink, but is as certain to ride over those great rolling mountains of seething water as a well built church is of standing on its foundation.

It is a great mistake to suppose, as some ship builders really do, that because a ship is big, no heavy seas will ever run on board. In consequence of this fallacy they take all manner of liberties in designs and constructions. It is difficult to believe there are such opinions in such quarters, yet it is so, notwithstanding. There is, doubtless, less science imported into ship building now than in former times, when iron for such work was a novelty, and when the worthy blacksmith, though occupying an indisputable position, played only second fiddle in the symphony; but the merest riveter should understand that the long, low steamers which are now turned out of our building-yards are the wettest, and, in too many cases, the most dangerous ships which ever put to sea. A great ocean wave, however high or fast it may run, will lift up bodily any small ship or boat, but not so some 400-footer; and, as a matter of course, if it cannot lift, must run over some part of her. Allowing such a wave to run at thirty five miles an hour, and a great part of its crest, say twenty-five tons of water, to overwhelm her decks, we have at once a force equal to the charge of a locomotive against everything in the shape of an obstruction to its course. Yet it is common to see such ships putting to sea with all kinds of trumpery and feeble fittings, such as obtained in high-sided ships of fifty years back—feeble, it should be said, in relation to the amount of freeboard or bad weather to be encountered, and afterward doleful accounts in the newspapers about "terrific weather and fearful damage."

A PROBLEM IN FLYING.—An interesting discussion is at present going on among scientific engineers in regard to the flight of birds, which has considerable bearing on the flying-machine question. It is a matter of observation that birds, without any movement of their outstretched wings, and without any apparent muscular exertion, are enabled to rise in the air and to move laterally even against the wind. The *modus operandi* of these movements is a mystery, and scientists are trying to discover the secret. The most plausible theory is, that the wings may be placed in such a position as to divert a current of air from its normal course until it represents two sides of an angle, of which the apex is the hinder portion of the bird's body. If that be the case, say the theorists, there would be really two currents of air coming into collision at the apex, the result of which would be a pressure upon the body of the bird at that point, urging it forward with force far greater than might be supposed. The smoothness of the feathers in but one direction reduces to a minimum all opposition to a forward movement. Experiments are now being carried out with mechanical contrivances to demonstrate the correctness of the theory, and it is stated that the investigators are in a fair way to a discovery of the cause of the phenomenon.—*London Cor. Philadelphia Telegraph.*

REGISTERING TRAIN SPEED OVER BRIDGES.—Mr. D. B. Kagenaar, of the University of Utrecht, recently devised a novel arrangement for registering the speed of trains while passing over bridges. It consists of two parts. At each end of the bridge is fixed a pedal, placed against the rail so as to be depressed by each wheel of the train passing over the spot. Each depression of the pedal makes contact in an electro-magnetic circuit, which, in part 2, acts on needles placed against a cylinder situated at any convenient distance. This cylinder is made to revolve by clockwork, at a uniform speed, and is covered with a sheet of paper. While no wheels pass the pedals on the bridge the needles mark straight parallel lines on the revolving paper sheet; but if contact is made as above mentioned, the respective needles are momentarily deflected, and mark the instant at which each wheel passes the pedal in connection on the bridge. The distance apart of the pedals at each end of the bridge being known, as also the rate at which the registering cylinder revolves, the speed of the passing train can be reduced by simple measurement of the distance apart of the traces made by the marking needles.—*Iron Age.*

USEFUL INFORMATION.

Waterproof Clothing.

For some time past the Belgian War Department has conducted a series of experiments at Valverde on the waterproofing of soldiers' uniforms by means of liquid alumina. With respect to the hygienic side of the question, the medical authorities have satisfied themselves that the articles of dress thus treated permit the perspiration to pass off freely, and chemical analysis has proved that the preparation used in no way injures the materials or destroys their color. More than 10,000 yards of materials, redressed two or three times over, notwithstanding the rinsing and washing to which they have been subjected after having been soiled, and after constant wear, remained perfectly waterproof.

The only drawback to the process appears to be that it is not very economical, and to insure the desired result, must be conducted on a large scale, which requires a considerable amount of plant.

The following, according to the *Journal d'Hygiene*, is the process employed: Acetate of alumina is obtained by making solutions of equal parts of alum and acetate of lead in separate vessels, and then mixing them together. Sulphate of lead will be thrown down, leaving acetate of alumina in solution, which must be decanted. The materials to be waterproofed are soaked in this solution, and then withdrawn without being wrung, and dried in the open air.

MUSCLE VS. MACHINERY.—A singular contest took place in a New Hazelton, O., coal bank the other day, says the Cleveland *Trade Review*. It was the old question of muscle vs. machinery, in a new form. A Harrison mining machine had been placed in the mine, and as usual, a great deal of good-natured discussion was held as to its working. On the one hand, it was claimed that it could do the work of four men; on the other, that two men could outdo it. Finally came a challenge to a friendly combat from two sturdy sons of toil, John Applegate and Joseph Hogan, the two men to put their work alongside that of the machine for three hours, the winning party to capture a purse of $100. Great interest was manifested in the match, hundreds of people gathering to await the results. For three hours—with the exception of eight and a half minutes lost by the machine man in changing from one room to another and in replacing picks—the underground contest raged. At the end of that time, the judges found by measurement that the machine had dug 154 square feet, and the two men 147 square feet, giving the victory to the machine, but by close margin, which was certainly most creditable to the men. The pick men gave forty strokes to the minute, the machine 150. An average day's work for the pick is a twelve foot room, three feet deep, or thirty-six square feet; of the machine, three eighteen-foot rooms, four and a half feet deep, or 243 square feet, but it is evident from the contest that the machine can make in one day of nine hours 462 square feet. We are glad to see that miners are growing to appreciate the advantages of machines, and welcoming them as friends rather than viewing them as enemies.

CEMENT FOR LEATHER.—When pieces of leather are to be cemented together, which are not subjected to traction or need not sustain heavy weights, *New Remedies* says that common glue will probably be the best binding substance; for thin leather, ordinary flour paste may also be used.

If the leather is subjected to a moderate strain, the following method may be used: Soak equal parts of glue and of isinglass for ten hours with enough water to cover them, then add about one-fourth part of tannin, and boil until the mixture becomes sticky. The surfaces of the leather must first be roughened with some coarse tool; they are then well rubbed with the above mixture, while warm, and firmly pressed together. After a few hours they will be found united.

Or glue (8 parts) may be soaked with water until soft, the excess poured off, and the vessel then placed on a water bath until the glue melts. One part of the glacial acetic acid is then added, and the mixture transferred to small vials. This liquid glue will also stick leather together very firmly.

An Austrian firm manufactures a glue which is said to be made from the entrails (skins?) of cattle which goes by the name of dermatin, and is reported to be used in England as well as on the Continent. This is said to glue leather together so effectually that the mended place will be as good as new, while it leaves it perfectly flexible.

SINGULAR OCCURRENCE.—A large cylinder of a Woolf engine, employed in the mines of Sarrebruck for about a year, was recently opened and examined. Attached to the piston was a large mass, brown and waxlike, weighing more than 150 kilogrammes (about 330 pounds). It contained 50 per cent of oxide of iron, 26.77 per cent of organic matter soluble in alcohol, 5.7 per cent of insoluble organic matter, and a residue composed of water with a little silicic acid. During the time the cylinder had been in use, about 192 kilogrammes of suet had been used for lubrication. The decomposition of the suet into glycerine and fatty acids led to the formation of a soap of protoxide of iron. The oxidation of the iron, which is limited chiefly to the interior of the cylinder, gradually produces an enlargement of the diameter. The cure for this is a mineral oil of good quality and a high boiling point.

A TOOL, after it has been forged, should be so hardened or tempered that it will never want to come to the fire again until it is so worn down that it requires reforging. This accomplishes two things—first, it saves the time lost in a second hardening; and, in the second place, it avoids the damage always done to the cutting power by rehardening without forging.

A FINE FINISH can be given to iron or steel, when turning, without polishing, by using a sharp cutting tool and keeping the work moistened with water. A bright and glistening surface is produced by this simple lubricant that is very pleasing to the eye.

A BUTTER TEST.—Sulphuric acid is said to be a simple, certain test for adulterated butter. Fresh, pure, yellow butter by the slightest contact with sulphuric acid turns almost a pure white, while oleomargarine made from tallow changes to a deep-crimson red. When lard or other oils are used the colors are diversified, showing all the colors of the rainbow.

HARDENING STEEL.—If a piece of steel be hardened and lifted from the water before it is cold, a crack or flaw may be the result. The reason is that the outer surface being very hard and the inside hot expansion commences, and a breakage of the hard, chilled surface is the consequence.

STAINING CHERRY IN IMITATION OF OLD MAHOGANY.—Digest logwood chips in vinegar or acetic acid for twenty-four hours or more. When ready to use, heat the solution, then dip the wood until the suitable color is obtained.

GOOD HEALTH.

Rheumatism.

The joints, the hinges of the body, are affected by rheumatism in such a way that the slightest motion gives pain. A creaking hinge is dry, and turns hard. A single drop of oil to moisten it makes a wonderful change, and it instantly moves on itself with the utmost facility. Rheumatism is an inflammation of the surface of the joints. Inflammation is heat; this heat dries the surface; hence the very slightest effort at motion gives piercing pain. In a healthy condition of the parts nature is constantly throwing out a lubricating oil, which keeps the joints in a perfectly smooth and easy working condition. Rheumatism is almost always caused by a cold dampness. A dry cold or a warm dampness does not induce rheumatism. A garment wetted by perspiration or rain, or water in any other form, about a joint, and allowed to dry while the person is in a state of rest, is the most common way of causing rheumatism. A partial wetting of a garment is more apt to induce an attack than if the entire clothing were wetted; because, in the latter case, it would be certainly and speedily exchanged for dry garments. The very moment a garment is wetted, in whole or in part, change it, or keep in motion sufficient to maintain a very slight perspiration, until the clothing is perfectly dried.

The failure to wear woolen flannel next the skin is the most frequent cause of rhumatism, for a common muslin or linen, or silk shirt, of a person in perspiration becomes damp and cold the instant a puff of air strikes it, even in midsummer. This is not the case when woolen flannel is worn next the skin.

This troublesome affection is cured by keeping the joint affected wound around with several folds of woolen flannel; second, live entirely on the lightest kind of food, such as coarse bread, ripe fruits, berries, boiled turnips, stewed apples, and the like. If such things were eaten to the extent of keeping the system freely open, and exercise were taken, so that a slight moisture should be on the surface of the skin all the time, or if in bed, the same thing were accomplished by hot teas and plentiful bed clothing, a grateful relief and an ultimate cure will very certainly result in a reasonably short time. Without these, the disease will continue to torture for weeks, months and years.

Inflammatory rheumatism may, for all practical purposes, be regarded as an aggravated form of the common kind, extended to all the joints of the body, instead of implicating only one or two. For all kinds, time, flannel, warmth, with a light and cooling diet, are the great remedies.—*Sanitarium.*

The Power of Suppressing Pain.

There are cases which I doubt not are very familiar to you, in which we can withdraw ourselves, as it were, from even severe physical pain by determinedly fixing our attention upon something else—either external objects or internal trains of thought. A very admirable example of that kind was prevented not long since by a well-known physician of this city, Dr. Edward H. Clarke, with whose case I have become acquainted through my friend, Dr. Oliver Wendell Holmes, who wrote a charming little notice of him affixed to the work on "Visions," which has been published since his death. The fatal malady from which he suffered during the latter months of his life produced the most agonizing pain; and yet he could determinately withdraw his consciousness, so to speak, from that pain, by fixing it upon another object, that object being the working out of his own mental train of thought in the composition of this book. This is well known to have been the case also with regard to Sir Walter Scott, who, during a very severe and painful illness, dictated the "Bride of Lammermoor." And the most remarkable fact about its composition was, that after his recovery, he entirely forgot all that he had done, the book, on its publication, coming to him as an entirely new work with which he had had nothing whatever to do. He only remembered the general outline of the story upon which he had composed his novel; this he had heard in early life, and it remained with him; but of the working up of this story into the novel, while he lay on his sofa contending with paroxysms of agony, he had no recollection. Thus, in the case of Walter Scott, as in that of Dr. E. H. Clarke, we see the effect of determined fixation of the attention upon a train of ideas in mastering physical pain. And I shall give you another most remarkable example of the same thing in the case of Robert Hall, one of the most celebrated preachers of my early years, of whom, I suppose, most of you have heard. He used to go into the pulpit suffering the most agonizing pain, which was found after his death to have resulted from a large calculus in his kidney, with projecting points, the terrible suffering produced by which every medical man will at once appreciate; and was obliged habitually to take some of the largest doses of opium that were ever administered in order to keep this under at all. But from the moment he began his extempore sermon (the introductory service having been performed by his colleague), he seemed utterly unconscious of it. During the latter portion of his life, which was passed in Bristol, I was often his hearer, and, like every one else, was most deeply interested in his discourses, while at times quite carried away by the torrent of his eloquence. I was assured by eye-witnesses that when he went down into the vestry he would sometimes roll on the floor in agony, though during his pulpit address he had ceased altogether to feel pain.—*Dr. Carpenter in Medical Journal.*

Hydrophobia.

For some time M. Pasteur, the French investigator, has been experimenting with a view of discovering whether the fatal infection of rabies can be disarmed of its power by inoculation. It is said that he now possesses four dogs which are proof against the infection, whatever may be the method of inoculation used or the virulence of the matter, while other dogs inoculated with the same virus invariably perish. The experimenter raises the question whether these four animals owe their impunity to spontaneous recovery from a mild attack, which may have escaped observation, or whether they are naturally refractory to the disease. One of the three dogs which he inoculated in 1881 survived, and though twice inoculated in 1882 he did not become rabid. The importance of finding a remedy for all forms of hydrophobia is magnified by two facts brought to light by the researches of M. Bert. One of these is that even if the saliva of a mad dog does not communicate rabies, it may prove fatal by producing serious local injuries; in other words, the secretions of rabid animals have poisonous properties over and above the special rabic virus. The second fact is that it does not follow because a dog which has bitten any person does not die, that the animal is free from rabies. These conclusions will add to the terrors of the disease; but there is some consolation in learning from M. Bert that the mere salivas of rabid dogs do not always communicate the deadly virus, and apparently never communicate it unless they contain the mucus from the respiratory organs, which seems to be the fatal portion of the saliva.

POISONOUS EFFECTS OF PETROLEUM SMOKE.—A curious instance of poisoning from the smoke of petroleum is reported in the *Neue Freie Presse*, of Vienna. A workingman's wife brought to a local hospital a child eighteen months old who had been seized early in the morning with violent convulsions, and had subsequently become unconscious. She also stated that her husband, on awakening, had been taken with cramps, and had an uneasy sensation in his upper and lower extremities, accompanied by headache, from which she was also suffering. The singular color of the child, and the result of careful examination, led to the conclusion that there had been acute poisoning from smoke gases. It was then discovered, that in the small and ill-ventilated bed-room occupied by the parties in question, a petroleum lamp was used as a night lamp, the flame being reduced as much as possible. The wick had, however, been left projecting without the protection of a glass cylinder. In this way the flame, of course, emitted smoke. The father (himself a delicate man) was also found to exhibit symptoms of poisoning. By the exertions of the medical men in charge of the cases, both the father and the child have progressed so far toward recovery that their restoration to health is confidently expected.—*Lancet.*

Passing Events.

There has been very little of special interest from the mining regions worthy of note of late, aside from what we have given in our usual "summary." Mining matters are rather quiet in this State, and at this season of the year when water is low many mines are shut down which later on will he at work.

We speak elsewhere of the progress of mining in Mexico. Doubtless many California miners are interested in that region, or will be, and will he glad to hear that it is being opened up by Americans.

The yellow fever at Guaymas is the topic of the hour, and measures are beiug taken to prevent the disease being hrought to this port.

AT different times during the past two years the question of building a railroad from Napa through Berryessa valley to Lakeport has heen agitated, and within the past two weeks graders bave been at work on the survey and the projectors of the scheme in a few days will put on a large force of men to carry the work on rapidly.

THE increase of 20 per cent by the State Board of Equalization of the assessment in Alameda county makes the total assessment $57,200,000.

ON the 17th inst. Hon. J. P. Jones was elected a Director and President of the Excelsior Powder Co.

THE Nevada shooting team beat the California team three points in the Inter-State match.

Home Manufactures.

There is very little question now that California will, before many years, become a great manufacturing State. Our manufacturing industries are gradually iucreasing in number aud extent, and the past four or five years particularly have sbown great advance in this direction. Many of our natural products, heretofore neglected, are being looked after, and more of our raw materials are being worked up among us, instead of being sent abroad. It is unnecessary to enumerate a catalogue of these things. Even the most unobserving of our citizens must have noticed how many more manufacturing enterprises there are than formerly. It is a good symptom of our material advancement and progress, and a sure indication that our community is becoming more and more self-supporting.

There is another thing which is beiug slowly overcome, but not to such a degree as it should be; that is, a curious disposition to helittle our own products, and to prefer the imported ones. We see the signs "Our own manufacture" more frequently than we used to; still, it is uot as sure an attraction as it should be. In articles of luxury we cannot compete with older communities, and for many things we must yet depend on the importers. Bnt, for many staples and manufactured things, we shonld prefer the things made by our fellow-workers in the community. People, in purchasing, should show a decided preference for home-made things; should always patronize our home industries when it is possible, and speak favorably of them when they deserve it.

The proper way to encourage home manufactures is to buy aud use home-made goods. It does no good to admire their appearance aud buy some imported thing of the same kind, simply because it has been customary to buy that brand or make. When one buys, he gives the best indorsement that can be given; all the testimonials and recommendations in the world will not speak as highly for an article as a purchaser's money. If we want the people to prosper who manufacture among us, we must buy what they make. In this way, and no other, can California he made a great manufacturing State.

New Battery Screen.

An improved form of battery screen for quartz mills has just heen patented through the MINING AND SCIENTIFIC PRESS Patent Agency hy Mr. Andrew S. Hallidie, the well-known wire manufacturer of this city. Ordinary screens are made of a single sheet of pnnched metal, or piece of wire cloth of the desired size of mesh. These screens are secured on a frame which is held in place in the grooves in the battery front by means of wedges. Whether of punched metal or wire cloth, the screens are always of flat pieces.

Mr. Hallidie branches out with the new idea of constructing the screen with angles or corrugations, so as to give more screen surface to the given size of battery opening. In the construction of the improved screen he employs woven wire, punched metal, or any other snitable screen material, and bends or corrugates the material into angular faces or flutings. Supporting rods or hars are fixed in the screen frame, so as to pass down in the angles of the corrugations and give any desired degree of stiffness.

In order to retain these screens in position they are fixed in frames which are shaped to fit the openings in the mortar in which the screens are to be placed. The top and bottom rails of these frames bave corrugated slots or grooves formed in them, corresponding with the shape of the corrugations of the screens, so as to hold them firmly in place. The screen made in this way instead of presenting a vertical flat surface to the splash of the water, presents a series of V-shaped faces, the screen surface being thus relatively increased, and the screen stiffened and strengthened. Mr. Hallidie is confident that this constructiou will make the screens last much longer, as they are not so apt to "bulge" and become broken as those of ordinary construction.

THE abolition of the tax on matches is, under the opinion of revenue officers, causing the former illicit manufacturers to go out of business, there being so many brands that are better and can he sold cheaper than the inferior quality made by them.

Mexican Mines.

In couversation with J. D. Schuyler, of Culiacan, Sinaloa, Mexico, who is in this city on a business errand, we learn that Americans are buying up many mines in various parts of Mexico, and that many old mines are being opened and developed in a systematic manner. In the district of Cosala, 80 miles east of Culiacan, there are many good mines, and some persons think the district will prove itself the richest in the world. A party of Colorado men who recently spent some months in the district examining the mines, say tbey saw more good mines there thau in the whole State of Colorado. There are some old mines there that have been worked for ages. Many of the old ones have been abandoned for one reason or another. In Cosala district is a famous one called the San Jose de las Bocas. It bas yielded an enormous amount of money, but the heirs of the original owners were in litigation for many years, and on one occasion the one in possession robbed the pillars and left the mine in very bad shape. It has, however, heen in bonanza continuously for 50 years.

Americans have bonded the Nuestra Senora mine that has a vein 110 feet wide. Its present owner is a Spaniard who has worked it for 20 years with 10 or 12 men in a "puttering" sort of way, yet realizes about $100,000 a year. There is another mine in the same district owned by the Anglo-Mexican Mining Co. This is a Belfast (Ireland) Co., but it has an office in this city. They are about to seud down a 20-stamp mill. It is said they have a vein 80 feet wide and running from $60 to $500 per ton.

About 10 miles west of Cosala is a rich miue owned by Americans. Some 20 miles southeast is the famous Guadalupe de Los Reyes, which is yielding steadily from $80,000 to $100,000 a month. It is owned by a Mexican, but is kept in fine condition. The machinery is first-class, and the hacienda, town and mine are lighted by electricity. Everything about the mine is in good shape. Right over the mountain is the Jocnitista, helonging to Haggin & Tevis, of this city, which is yielding from $50,000 to $75,000 per month.

In the district east of Culiacan, just over the line of Durango, are some very rich mines. In most of these districts transportation has been so high and business so uncertain that a mine had to be very rich to pay at all. They have been throwing aside ore that would not go $10 or $12 to the cargo of 300 pounds. There are no smelting works for general use. The very large mines have their own reduction works, but the smaller ones are without them. There are thousands of small mines that would pay if there were centrally located works where ores could be sold when mined.

An American company from Tennessee recently bought a gronp of seven mines, about 100 miles northeast of Culiacan. They have ordered a 10 stamp mill in this city, which will be forwarded next month. Some more Americans have located what they think is the best mine in Mexico. It is in a country which until a year or so has been inaccessible on account of Indians and bad characters. It is one and a half days' journey north of Topia. The mine is called the Tahualneto. The legend connected with it is to this effect: It has turned out millions of dollars, and there was at one time struck in it a vein of solid silver one foot wide. The mine is known to have heen worked for over 200 years. There are near by ruins of a very large town, hacienda, etc. The workings in the mine are from 1,000 to 1,500 feet deep. The Indians repeatedly killed off the men who came from time to time to work the mine. Others would come, re-establish the hacienda, and begin work, only to be driven off. There is a tunnel 7 feet square running in over 500 feet, to the vein itself. No work was done on the vein, however, the miners having evidently been driven off just as they finished the tunnel. This tunnel is in very hard rock, and evidently lime was used instead of powder. The blast-holes are very close together indeed, and appearances all point to the use of lime. Some San Francisco men having found the mine abandoned have taken it up, and are going to drift along the vein from the tunnel.

OVER 200 British, American and German missionaries in China have addressed a petition to the British Government praying for the bolition of the opium trade.

Testing Quality of Pozzolana.

One of the most difficult and slowest operations in industrial chemistry is that of determining the quality of pozzolana (from which hydraulic cement is made), so as to give, in conjunction with lime, a mortar of great resistance. A method of analysis is proposed by Mr. Landrin which, in preference to those already known of Vicat and Caundenherg, has the advantage of only requiring a short time for the experiment. In fact, Vicat's method, which consists in observing the action of the water of lime on the pozzolana, requires, in order to obtain satisfactory results, a period of several months.

It seems that the most careful analysis of the pozzolana cannot determine its quality, but simply its components. But if the pozzolana is treated with hot chloro-hydric acid, there will be obtained a soluble and an insoluble substance, and it will be seen that the latter is nearly entirely composed of silicious matter. Mr. Landrin states that it is frequently the more or less quantity of silica capable of being united with lime that determines the quality of the pozzolana. But for such determination it is not the quantity of silica shown by the analysis that must be computed, but only that which can combine with the lime.

Mr. Landrin experimented on three qualities of pozzolana: one coming from Reunion Island, one from Italy, and the last manufactured near Paris. Relying on the fact that the hydraulic silica has the property of reducing the water of lime, he treated the pozzolana with boiling chloro-hydric acid and put a certain quantity of the insoluble substance thus obtained in the water of lime. In 24 hours he was thus able to ascertain that the action of this silica was such that it reduced, in the true pozzolana, an enormous quantity of water of lime. The silica of the Italian pozzolana reduced in that short interval, about 105 times its volume of water of lime. On the contrary, the French artificial pozzolana, which, by analysis, had given a larger quantity of silica than the two others, only reduced, in the same interval, four times its volume of water of lime. In effect this latter pozzolana produces but an inferior quality of cement.

The experiments made in comparison with the preceding method, that is, treating hot the insoluble substance of the pozzolana, but the pozzolana itself with water of lime, have shown that these methods can in no wise be compared with the rapidity of the one just described.

Mr. John S. Hittell, the well known California writer, who is now in Europe, sent recently some fine samples of pozzolana from Rome to the State Mining Bureau. The material is found near Rome as a dark brown sand, and is used in all the mortar of Rome and vicinity. It is exported to make hydraulic cement, and Mr. Hittell is preparing an essay on its value as compared with Portland cement.

What is supposed to be a deposit of this valnable substance was found a short time since near Berkeley, and some of it was sent to Mr. Hanks, State Mineralogist. He proposes to make some tests by the method above described. Some of the cement sent him was quite hard, but we understand that practical men in the business have tried the local pozzolana, and found it did not come up to expectations, making a substance that was friable and soft. The tests Mr. Hanks will make will he of interest in this connection.

NEWSPAPER ACCOUNTANT.—Albert Hart, formerly private secretary for Gov. Bootb, Gov. Pacheco and Gov. Perkins, has been appointed newspaper accountant of the San Francisco postoffice. The office is one of trust and responsibility, and there is considerable work attached to it. Accounts have to be kept with each newspaper and sender of periodicals, whose mails are paid for by the pound. An extensive set of books has to be kept, and great accuracy observed. From what we know of Mr. Hart, we expect that he will make an invaluable officer in this department.

THERE are at present 700 men, forty steam boilers, three steam barges, a steam launch and a tug, employed in constructing the steel railway hridge across the Firth of Forth. The work is being prosecuted with great energy. A wooden pier, eighty feet broad, and carrying a double line of rails, bas been carried 1,200 feet from the south shore, and will he continued 700 feet further to the point where the first caisson-tower will be placed.

UPWARDS of 500 men are engaged in extending the "dummy" road of the Market street railroad to the ocean beach.

Water Wheel Experiments.

(CONTINUED FROM PAGE 177.)

velocity being small, the resistance of the air may be neglected. We have then:

$$G_3 l_1 = \varphi (G_3 + \mathfrak{G}) \frac{C_2}{C_3} l_1 + \varphi \mathfrak{G} \frac{C_2}{C_3} l_2$$

$$\varphi = \left(\frac{C_3}{C_2}\right) \frac{G_3 l_1}{G_3 l_1 + \mathfrak{G}(l_1 + l_2)}$$

In our case t was about 25 seconds and l_1 4.32 feet, hence G and G_3 were practically identical.

A number of experiments were made leading to a mean result φ .045.

Having thus found the useful work (L), the expression for the efficiency of the wheel (η) was reduced to a convenient form, as follows:

Let a represent the area (in square feet) of the supply pipe at point A (see Fig. 4), beyond which all losses are charged to the wheel.

Let v represent the velocity (in feet per second) of the water in the pipe at that point.

Let Q represent the quantity of water (in cubic feet per second) discharged through the nozzle.

Let γ represent the weight of one cubic foot of water = 62.3 lbs.

Let h represent the hydraulic head (in feet) at point A as given by the gauge.

Let H represent the actual head (in feet) to be charged to the wheel.

Then $H = h + \frac{v^2}{2g} = h + \left(\frac{Q}{a}\right)^2 \left(\frac{1}{2g}\right)$

A number of experiments were made establishing the weight of water ($Q_1 \gamma$) discharged per second through the nozzle under head H_1. Then for any head H (not differing much from H_1) we have

$$Q\gamma = Q_1 \gamma \sqrt{\frac{H}{H_1}} = M_1 \sqrt{H},$$

Wherein M is a constant for any one nozzle, and H is calculated, as above indicated, from observed values of h. In our experiments we had practically $H = h +$ a constant, for any one nozzle, the heads varying but slightly.

The energy of supply water charged to the wheel is then $Q\gamma H = MH^{\frac{3}{2}}$. Hence the efficiency:

$$\eta = \frac{L}{MH^{\frac{3}{2}}}$$

The following curves of efficiency have been plotted from experiments made by the class: Ten experiments with a ¼-inch nozzle under head H = 55.4 feet, and eleven experiments with a ⅜-inch nozzle under head H = 50.1 feet. These were made with different velocities of the wheel, in order to determine not only the highest efficiency, but also the importance of a slight deviation from the best speed (see Fig. 8). The vertical lines mark the number of revolutions of the wheel per second, and the horizontal lines the efficiency.

The greatest efficiency reached with the ¼-inch nozzle was 66.4% at 9 revolutions per second, and with the ⅜ inch nozzle 75.1% at 8 revolutions. The great difference in these results is doubtless attributable in the main to the spread of the water after entering the bucket. The wheel being encased in a glass cover, this was easily discerned in the water discharging from the wheel (see Fig. 9). In the second case the energy of the discharging water is more under control, since it remains more nearly in the plane of motion of the wheel. There is some difference, of course, in the loss due to journal friction in the two cases, but this loss amounts only to about 2 in the first and 1 in the second case.

The efficiency reached would probably be further increased:

1st. By flaring the entrance to the buckets, as shown in Fig. 10, so that a still larger nozzle could be used, and the spread of the water in the buckets be still further diminished.

2nd. By regulating the angle β (see Fig. 2) so as to better adapt it to the actual best velocity as found by experiment. This was provided for in the manner of attaching the vanes; but there was no time left for the experiments.

3d. By making the angle of the bend, immediately back of the nozzle, more obtuse. In our case this angle is 90° and the loss 7-10ths per cent. By doing this the nozzle might also be shortened and the angle a made smaller.

4th. It is also surmised that there would result a gain from shortening the buckets at the discharge end and making the curve there sharper.

The great advantage in gearing for transmission of power causes such preference for the vertical wheel that outer discharge was adopted, notwithstanding the difficulties encountered in setting the nozzle.

Partial Jonval Turbine. Fig. 11.

This wheel has some advantages over the tangential wheel in the setting of the nozzle. The angle a may be made much smaller, and consequently it is not necessary to use so many buckets. It is our intention to experiment with such a wheel with the next class in hydraulics.

FIG 11.

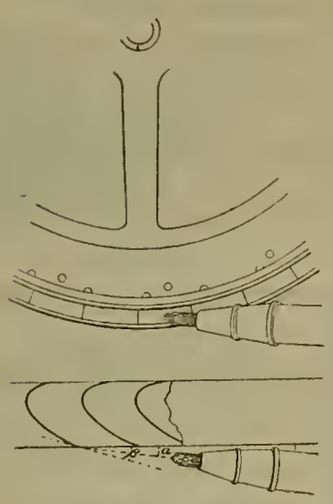

Fig. 8.

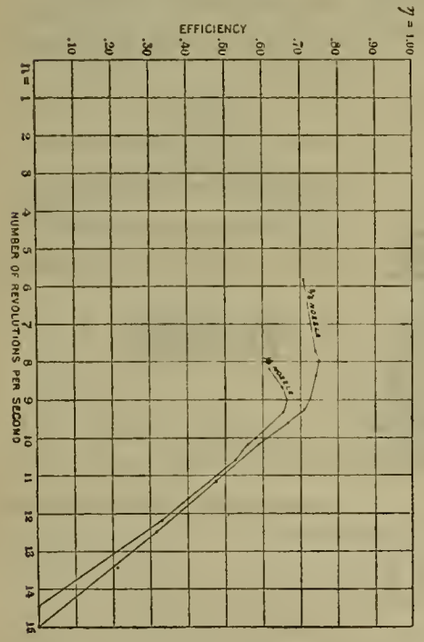
¼ inch nozzle H = 50.1 feet. ⅜ inch nozzle H = 55.4 feet.



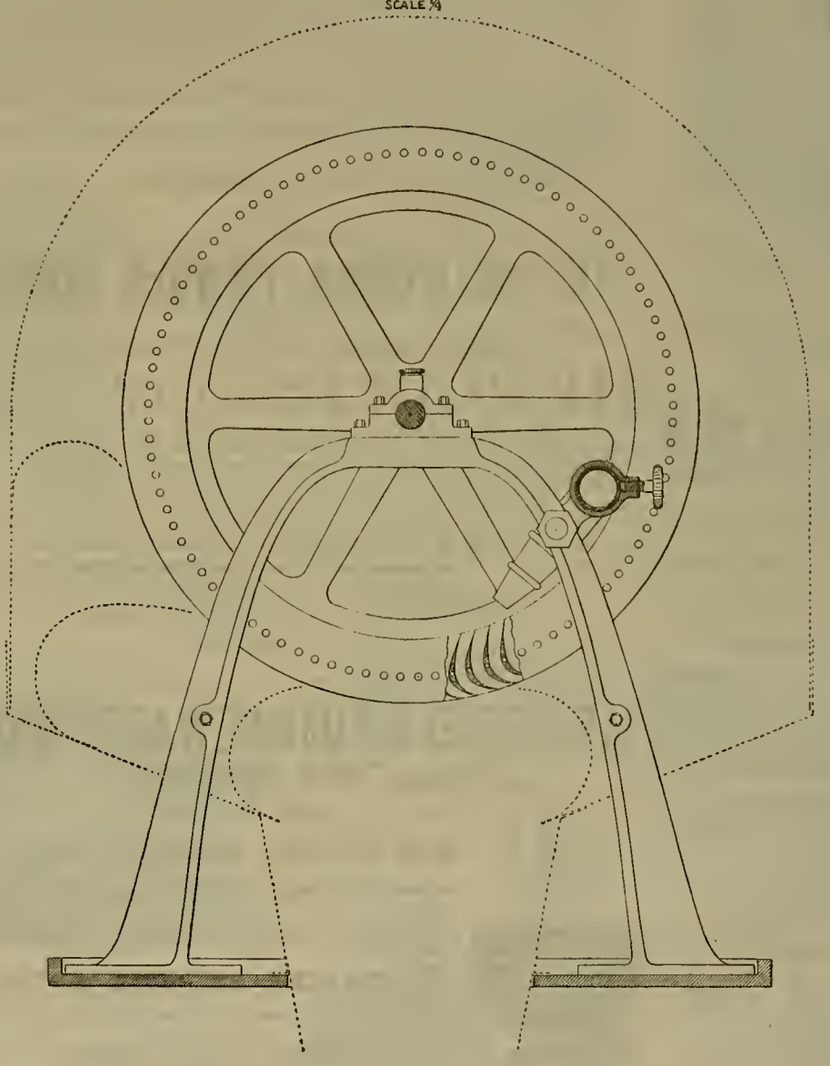


FIG. 3.

PARTIAL TURBINE (TANG. WHEEL)

Ventilating Levels.

There are a number of methods of inducing air currents for ventilating drifts or tunnels. Ventilation may be either natural or artificial. In sinking shafts, unless the shaft be deep, a simple brattice of thin wood or painted canvas dividing it from top to bottom into two, will usually be sufficient. The men working in the shaft on one side of the parting will raise the temperature somewhat, when it will be converted into an upcast, while the cool air will descend on the other side.

A natural current may often be produced in a long level by means of an "air sollar." To form an air sollar, the floor of the level carrying the tram road is laid about six inches above the actual bottom of the level, and is supported by cross sleepers resting on blocks of wood or stone, or the flow in the center of the level may be excavated somewhat deeper than the sides. Planks are laid over the sleepers just mentioned to form a kind of deck, and the whole is rendered airtight by plastering with mud. This divides the level or tunnel into two very unequal portions. Through the lower division, or air sollar, a current of cool and heavy air will pass to the force at work.

The air heated by the breathing of the men, the heat of lamps, etc., will pass out through the level itself, and so a constant current is kept up. The level should be kept as truly level or dead as possible for several reasons, two of which may be mentioned: First, if there be water flowing through the level, and the fall be considerable, the rapidity of the current of water will, to some extent, check the ingoing air. Second, if the level rise rapidly the floor of the end will soon be at a higher actual level than the "roof" of the entrance, when the heated air will actually have to descend in order to make its escape, although the natural tendency of heated air is always to ascend.

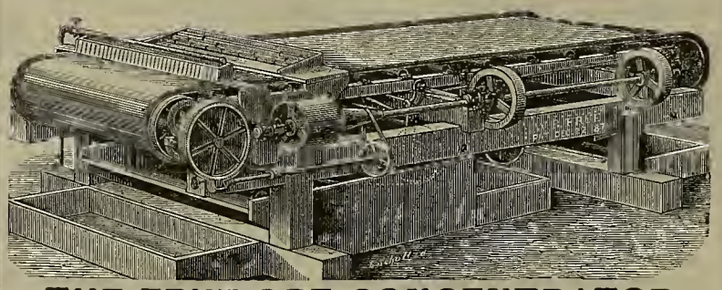
J. W. QUICK, MANUFACTURER.



Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens Mill owners using Battery Screens can at all times contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St. S. F.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.
A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company
That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.
That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.
That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.
That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.
That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES

Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Olant and Old Abe Co., Black Hills also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

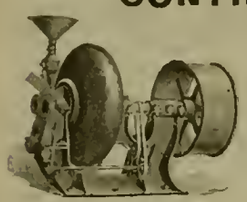
Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,



Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,600 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

SEPARATION OF NITRIC ACID FROM A MIXTURE OF NITRIC AND SULPHURIC ACID.—Fred Jenssen, S. F. No. 284,742. Dated Sept. 11, 1883. This process of separating from a mixture of nitric and sulphuric acids the nitric acid in separate portions, or quantities according to their several strengths, and by a continuous operation, consists in passing a continuous stream of the mixture through a connected series of retorts, to which are given separate degrees of heat, and in distilling the nitric acid over from each retort into separate receptacles. In this operation the strongest nitric acid, requiring the least degree of heat, will distil over from the first of the retorts, and the weakest from the last, where the greatest heat is required, so that in each of the receptacles there will be a different strength of acid. The reason of the mixture in the first place may be either to concentrate the nitric acid, by subsequent distillation, or it may be acquired in the progress of many operations unnecessary to mention here. The apparatus which Mr. Jenssen uses to accomplish the separation consists simply in a number of vessels or retorts, so arranged and connected each with an entrance and exit that a liquid may be supplied to the first, whence it shall pass through each and find an escape from the last. With each of the retorts is connected its receiver, or condenser, and with the last is connected a suitable cooler.

ANIMAL TRAP.—Wm. H. Reed, S. F. No. 284,759. Dated Sept. 11, 1883. This is an improvement on that class of animal traps known as the "gravitating platform trap." The invention consists in the peculiar weighted platform. The platform is arranged to oscillate, and suitable weights return it to its position. The animal in trying to reach the bait steps on the edge of the platform, which gives way and drops him into water or the box. The platform, relieved of the animal's weight, resumes its normal position again immediately.

THILL COUPLING.—John McLaughlin, San Rafael, Cal. No. 284,750. Dated September 11, 1883. This improvement for connecting the shafts or poles, to vehicles, consists of plates projecting from slips upon the front axle, and having slots adapted to receive the cross bars of links which are rigidly fixed to the shafts.

VEHICLE SPRING.—Neil L. McAdam, S. F. No. 284,748. Dated Sept. 11, 1883. This consists of a combination of springs and a series of suspending rods producing an oscillating as well as an elastic movement of the body. It also consists of such combination and arrangement of the springs that they serve as braces to the rear axle, and their front ends are so mounted that no bolster is necessary.

FLOOR CLAMP.—Henry D. Margot, Mountain View, Santa Clara Co. No. 284,747. Dated Sept. 11, 1883. This is a machine for adjusting the matched stuff of floors and ceilings so that each board may be fitted and secured to its place with accuracy. The object of the invention is to force the boards to their place and hold them until secured, with the exercise of little power and without damage to the boards. It may be used for floors or ceilings.

HARROW, ROLLER AND SEEDER.—James R. Bane, Gilroy. No. 284,709. Dated Sept. 11, 1883. This is a combined harrow, roller and seeder of peculiar construction, an effective and easy working agricultural implement being provided. An intelligible description would be difficult without the aid of engravings.

An Improved Steam Jet Pump.

A very effective steam jet pump of an improved construction is now being introduced on this coast. It is entirely different from the ordinary steam jet pump as ordinarily made, and is designed to do more work with less steam. In this pump the water or liquid enters through a series of cones. These cones are so arranged as to cause the liquid to come in contact with the jet of steam in several streams. The angles of these streams are such as to give them an upward and forward motion. A portion of the liquid passes through the first coue, and is forced upward through the pump by the jet of steam. The liquid which enters through the next cone has its flow accelerated, both by the force exerted by the steam and by the impetus of the liquid which has passed through the first cone. This double action is carried on until the liquid passes through the pump and reaches the discharge pipe, where (having obtained great rapidity of motion) it is carried on with sufficient power and velocity to accomplish the object.

In short, the force exerted by a jet of steam is the active agent; the vacuum formed is all utilized as auxiliary, and the impetus gained by the liquid first submitted to the action of the steam jet, is applied as motive power to the succeeding streams of liquid; a triple action which increases the power and capacity of the pump, and at the same time reduces the amount of steam consumed.

The water or liquid is compelled to leave the pump and enter the discharge pipe in a solid body without spraying; a good head being thus obtained. When using steam of an excessive pressure the steam does not "cut through the water as the conductor of the force pump prevents any steam entering the discharge pipe."

A great peculiarity of this steam pump is that it has no valves, no moving parts, no pistons, cranks, belts, pulleys, cogs or fly-wheels, and takes no oil, no packing, and no care. Having no mechanical movement, it requires no skill to set it up or operate it. This is a very important item to those at a distance from machine shops or mechanical help. It requires no attendance, and can be operated and controlled from a distance, by merely opening or closing a single globe-valve. As it has no tortuous courses for the ingress, egress and flow of water or liquid, no small vents, passages or glands, no valves to keep tight, it will elevate and convey liquids containing sand, mud, or other foreign matter, or which are gritty or greasy, so long as the liquid remains in a fluid state.

The pump is made of brass, and is extremely portable and compact. It occupies no room to speak of. In fact, one to lift 300 gallons an hour only weighs about half a pound, and one which lifts 3,000 gallons will weigh, perhaps, three pounds. It is fixed in place on the pipe, and looks like an ordinary brass coupling. Mr. Edward A. Rix, the agent, has one at work in his store at 18 and 20 Fremont street, and it is a matter of surprise to most persons to see so small an appliance do so much work. The pumps cost all the way from $6 to $7 up to $20, according to size.

This Van Duzeu improved patent is both a force and lift pump. It will pump water from ponds, wells, rivers, vats, tanks, cellars, for agricultural and mining purposes, for mills or factories, etc., and is adapted to all the uses of a steam pump. Any one can fit it to the pipe himself. This useful appliance will no doubt be very largely used when better known. Its low first cost is a very great advantage, and lack of mechanism is another.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

The State Fair.

State Fair week this year fell in an area of delightful weather, for only on one or two days was the heat excessive. The attendance was large, and the patronage of the fair satisfactory, for the receipts were $19,475.80 this year, an excess of $2,383.15 over last year's income. We have not space to give the whole list of premiums, but append the awards in certain classes:

Implements and Machinery.

CLASS 1.—H. P. Gregory & Co., S. F., portable steam engine, honorable mention; Faulkner & Hill, Woodland, punch and shears, special premium recommended; M. R. Rose, Sacramento, best display of machinery from one shop; Joseph Enright, San Jose, best portable steam engine; Henning Bros., Sacramento, gas machine, diploma; Henning Bros., Sacramento, self-generating gas burner, diploma.

CLASS 2.—Agricultural Machines (First Division)—F. A. La Shells, Briggs Station, cylinder and concave teeth for thrasher, special premium recommended; Baker & Hamilton, Sacramento, best horse hay rake, best lawn mower; H. P. Gregory & Co., S. F., circular sawmill operated by steam and water, awarded a diploma; Baker & Hamilton, Sacramento, best thrashing machine; A. & A. Heilbron, Sacramento, best cider mill and press and best hand corn sheller; Laufkotter & Dalton, Sacramento, best sweep horse-power; Holman, Stanton & Co., Sacramento, best hay press, best post hole auger, best well auger, and best lawn sprinkler.

CLASS III.—Agricultural Implements (Second Division)—W. A. Howard, Dixon, best harrow; D. M. Osborne & Co., S. F., best combined reaper and mower and best self-binding harvester; J. D. Winters, Davisville, best derrick for stacking grain, and best header wagon nets for stacking grain; Baker & Hamilton, Sacramento, best broadcast seed sower, best reaping machine, best corn planter; best potato planter, best display of reaping and mowing knives, best hoe; Grangers' Business Association of Sacramento Valley, spring-toothed single and double broadcast seeder, special premium recommended; Judson Manufacturing Co., S. F., best mowing machine; A. & A. Heilbron, Sacramento, best one-horse cultivator; William Gutenberger, Sacramento, best field roller and crusher; J. F. Hill, Sacramento, harrow with self-cleaning attachment, special premium recommended.

CLASS IV.—Agricultural Implements (Third Division) D. B. Matlock, Sacramento, best farm gate; John Klees, Sacramento, best grain separator and fanning mill; T. M. Lash, farm gate, honorable mention; Holman, Stanton & Co., best farm feed mill and best platform scales; A. & A. Heilbron, best windmill.

CLASS V.—Tools and Household Implements—J. D. Winters, Davisville, best churn; Baker & Hamilton, Sacramento, best garden seed drill and best ironing machine; A. & A. Heilbron, best road scraper; best display of haying and harvesting tools; M. R. Rose, best well pump; Holman, Stanton & Co., best sausage meat cutter and stuffer; William Gutenberger, best apparatus for raising water for irrigating and mining purposes; A. L. Coombs, Grass Valley, Plumber's improved fruit drier, special premium recommended.

CLASS VI.—Plows Holman, Stanton & Co., Sacramento, gang plow; Holman, Stanton & Co., sulky plow; Baker & Hamilton, Sacramento, stubble plow; A. & A. Heilbron, Sacramento, sod plow; A. & A. Heilbron, Sacramento, steel plow; A. & A. Heilbron, cast iron plow; Baker & Hamilton, Sacramento, sub-soil plow; Baker & Hamilton, sidehill plow; A. & A. Heilbron, one-horse plow; Baker & Hamilton, Sacramento, dynamometer; Baker & Hamilton, chilled plow; Baker & Hamilton, plow for all purposes; Dr. C. Grafton, Stockton, double gang plow, special premium recommended.

Vehicles—Best family carriage, J. F. Hill, Sacramento, best top buggy, J. F. Hill, Sacramento; best open buggy; A. Meister, Sacramento; best two-seated open wagon, A. Meister, Sacramento; best trotting wagon, Grangers' Co-operative Association, of Sacramento Valley; best spring market wagon, San Jose Agricultural Works; best breaking cart, J. F. Hill, Sacramento; best ladies' phaeton, A. Meister, Sacramento; best business wagon, J. F. Hill, Sacramento; best carriage or cab for children, G. W. Hancock & Co., Sacramento; best display of carriage wheels, hubs, etc., J. F. Hill, Sacramento; best wagon brake, Grangers' Business Association, of Sacramento. A large number of entries in this department, for which there were no premiums offered, were given an honorable mention or recommended for a special premium.

Incubators—Best incubator, Dias & Co., Petaluma (Petaluma incubator); best mother or brooder, Dias & Co., Petaluma.

Mechanical Products.

Leather, Paper and Rubber Goods—E. Bernheim & Co., Oakland, display boots and shoes, pair Congress gaiters and pair gent's dress shoes; Asher Longshore, Sacramento, exhibition traveling trunks, valises, etc.; Weinstock & Lubin, Sacramento, pair dress boots, heavy boots, ladies' slippers, ladies' gaiters and bootees; F. Foster & Co., Sacramento, display bound account books; L. A. Reisler, patent side saddles; Main & Winchester, San Francisco, best set double harness and best set single harness; C. H. Krebs & Co., Sacramento, decorative paper hanging and display of paper hangings and borders; J. T. Stoll, Sacramento, Mexican saddle, display of saddles and bridles, display of saddle trees, gent's saddle, side saddle, patent collar; W. F. Peterson, Sacramento, hair bridle.

Worked Metals—Huntington, Hopkins & Co., Sacramento, copper work, brass work, modern building ware, general hardware, iron and steel, mechanics' tools, horse-shoes (machine made), table cutlery, pocket cutlery, circular saws, files, pruning shears, pruning knives, anti-friction metal, and shot; Scott & Muir, Sacramento, display of plumbers' goods and wares, gas chandeliers and burners, lamps; G. W. Hancock & Co., Sacramento, display of silverware; J. T. Stoll, Sacramento, display of saddlers' hardware; Shafer & Bronner, tinware, copperware,

Stoves, Castings, etc.—L. L. Lewis & Co., Sacramento, cooking stove (for wood), cooking stove (for coal), parlor stove, warming furnace, cooking range, portable range, hollow ironware and ornamental fruit and flower stand; Aitken & Fish, Sacramento, parlor grates; Shafer & Bronner, Sacramento, laundry stove; Henning Bros., Sacramento, gas stove.

Musical Instruments—Frank J. Johnson, Sacramento, banjo and case (California make); F. R. Girard, San Francisco, best organ (Western Cottage organ), best reed instruments; Girard piano was recommended as a home production; A. Bruenn, Oakland, best general display of musical instruments, best piano (Sohmer Grand); W. G. Badger, the committee recommended the Hallet & Davis piano as one of superior production.

Furniture (California manufacture)—Mrs. W. H. Mead, Sacramento, center tables; B. F. Farrar, San Francisco, display of mattresses, best spring mattresses, special premium recommended for section mattresses; John Breuner, Sacramento, dressing bureau, sofa, lounge, extension table, office chair, set of parlor chairs, sidetables, set of parlor furniture, display of furniture, writing desk, bookcase, wardrobe, sick chair or couch, school furniture, set of bed-room furniture, display of upholstery, office desk; Alexander Jansen, San Francisco, sofa beds, special diploma recommended.

Woodenware (California manufacture)—Billingsley & Co., Sacramento, cedarware, pineware, oakware willowware, splitwood baskets, osier ware, assortment of coopers' ware.

Dental and Drawing Instruments, etc.—Robert Beed, Oakland, artificial limbs; C. J. Noack, Sacramento, magic clock.

Chemicals—Billingsley & Co., Sacramento, display of blacking; Bidwell & Co., Sacramento, yeast powder; M. A. Reeves, San Francisco, Reeves' Great Electric Hair Tonic; Standard Soap Co., S. F., display of soaps; Thomas' cold water bleaching soap; lubricating petroleum; display of saleratus, potash and alkalies; display of candles.

Stoneware, Bricks, Confectionery, etc.—H. F. Bundock & Bro., Sacramento, stoneware; Billingsley & Co., Sacramento, demijohns; W. F. Peterson, Sacramento, confectionery; G. W. Hancock & Co., queensware, ground and cut glass, glassware, ground glass and stained glass.

California Drawings, Designs, Marble and Granite Work—Aitken & Fish, Sacramento, collection of polished marble work, six pieces; marble mantel and carved marble mantel.

Force.

EDITORS PRESS:—In the London *Engineer* of August 19th is an editorial article on the definitions of "force," as given by several distinguished scientists. The definitions are worthy to be quoted and are as follows:

"Force is an action exercised on a body tending to change its state of either rest or of uniform motion in one direction."—[Isaac Newton.

"Force is that which tends to cause or destroy motion, or which actually causes or destroys it."—Henry Mosely.

"Force is said to be whatever produces, destroys or changes motion."—[Whewell.

"Force is an action between two bodies, either causing or tending to cause change in their relative rest or motion."—[William Macquorn Rankine.

"Force is any cause which changes or tends to change a body's state of rest or motion." [Harvey Goodwin.

"All we know is that bodies under certain circumstances alter their velocities at a given rate, and this state of change of velocity, or taking into account the mass of the bodies, their change of momentum."—[Prof. Tait.

"The presistance of force is the one great unquestionable, all-embracing principle which explains all other principles, including evolution itself, and is the foundation of the physical universe."—[Herbert Spencer.

To these definitions may be added the following:

"Force is elemental mind."—[Aristotle.

"Monad," particles of matter, are continually active, and are continually changing their situation in virtue of this principle of innate, indefinable perception.—[Leibnitz.

"Matter in motion is the expression of force." [Tyndall.

It will be noticed that with the exception of Aristotle and Leibnitz, the conceptions of the scientists quoted relate to the effect of force, rather than to force itself.

In this connection, I beg to present some views of my own on the subject which, for the sake of brevity, I will give in the form of answers to possible questions, premising that physical science is the knowledge of the laws of the cosmos or material universe and the application of their principles to human purposes.

The cosmos or material universe is composed of matter, force and motion. Matter is the embodiment of force. Force is the soul of matter. Motion is the effect of the action of force in or on matter. Matter may be called the embodiment of force, because force pervades matter as does the human soul the human body. Force may be called the soul of matter because of its analogy to the human soul. This analogy consists in this: First, like the human soul it has three powers or laws; second, it is visible only in its effects; third, the effect of its action on or in matter is life, motion and development. The powers of the human soul are will, memory and understanding. The powers and laws of force are, respectively, radiation, gravitation and equilibrium.

The difference between the human soul and force consists in this: In the human soul the will is free; in force, radiation, its analogy, is subject.

The effect of the action of force in or on matter is life, motion, and the phenomena of development, or nature. Nature is matter, force motion, and the laws and effects of their development. The practical advantage of knowledge of nature's laws is, that while nature, to a certain extent, is subject to man and obeys his will, still it obeys according to its own laws. Therefore, unless these laws are understood, provision cannot be made for their harmonious action, without which the best possible effect in art are unattained. JOHN B. WARD.

San Francisco, Sept. 15th.

THE fashion of industrial exhibitions is spreading. Even Reikjavick, the capital of Ireland, has one. Among the exhibits are gold and silver work, wood carving, pictures, machines, fishing-tackle, clothing, carpets, saddlery, linoleum, etc., the products of home industries.

AT the Congress of Commerce and Industry, at Amsterdam, now in session, a resolution has been adopted declaring that the principal cause of the depreciation of silver results from a decrease in its coinage in Europe. A wish for a common double standard throughout Europe and America was also expressed.

THE Massachusetts Commission of Immigration says the worst class of paupers they are called upon to provide for come through Canada, and additional legislation is asked to prevent such influx.

A MAN pushing a hand car from St. Louis to this city, has got as far as Salt Lake.

THE best medicine of the age for quickly curing indigestion, nervousness, etc., is Brown's Iron Bitters.

Departed Mine Operators.

Two noted mining men, widely known all over this coast, have passed over to the "silent majority" Col. C. W. Lightner, and General John W. Gashwiler. The former came here in 1849 and was at one time superintendent of the Union Iron Works, when owned by James Donahue. At one period he was also superintendent of the Sacramento Gas Works. He was President of the Ophir Mining Co. when that lode was immensely rich and seemed inexhaustible in extent. At the time Raymond & Ely paid such heavy dividends, and was selling for enormous sums of money, he was president of the company. He was afterwards superintendent for a number of years of the Sulphur Bank quicksilver mine, in Lake County. These are only a few of the mining enterprises with which he was connected in the course of his long experience on this coast.

Gen. Gashwiler was a typical California pioneer, and popular everywhere as "Old Gash." He was an early miner in Tuolumne county, and was one of the first at the front of the Washoe excitement in Nevada, where he was an organizer of the water company supplying water to the people on the Comstock. He was more closely, however, identified with California quartz mines, and his name was prominently connected with the Plumas-Eureka, Sierra Buttes, Hayward Keystone, Original Amador, Seaton, Black Bear, Klamath and dozens of other California mines. He attended to large interests for English mine owners, and was one of the best mine promoters on this coast. His operations in Belmont a few years ago attracted great attention. He was for a time at the Black Hills, in Dakota; and has mined, or been connected with mines in one way or another in all the Pacific States and Territories. Gen. Gashwiler had hosts of friends, as he was plain, unassuming, generous and hopeful. He was one of the most noted of the mine operators of this coast.

PHYSICIANS prescribe Brown's Iron Bitters for indigestion, weakness, low spirits, etc.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

REMITTANCES to this office should be made by postal order or registered letter, when practicable. Cost of postal order, for $15 or less, 10 cts.; for registered letter, in addition to regular postage (at 3 cts. per half ounce), 10 cts.

Only "PEBBLE" Establishment.

1863  1883

Muller's Optical Depot,

Compound Astigmatic Lenses Mounted to Order Two Hours Notice

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

No Whiskey!

BROWN'S IRON BITTERS is one of the very few tonic medicines that are not composed mostly of alcohol or whiskey, thus becoming a fruitful source of intemperance by promoting a desire for rum.

BROWN'S IRON BITTERS is guaranteed to be a non-intoxicating stimulant, and it will, in nearly every case, take the place of all liquor, and at the same time absolutely kill the desire for whiskey and other intoxicating beverages.

Rev. G. W. RICE, editor of the *American Christian Review*, says of Brown's Iron Bitters:

Cin., O., Nov. 16, 1881.

Gents:—The foolish wasting of vital force in business, pleasure, and vicious indulgence of our people, makes your preparation a necessity; and if applied, will save hundreds who resort to saloons for temporary recuperation.

BROWN'S IRON BITTERS has been thoroughly tested for dyspepsia, indigestion, biliousness, weakness, debility, overwork, rheumatism, neuralgia, consumption, liver complaints, kidney troubles, &c., and it never fails to render speedy and permanent relief.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Drytown, Amador county, California. NOTICE.—There are delinquent upon the following described stock, on account of Assessment No. 3, levied July 31, 1883, the several amounts set opposite the name of the respective shareholders, as follows:

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Bolgium, Prussia, Austria, Baden, Penn, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Repuhlic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been doue, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost hy extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will he held strictly confidential hy us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application hy pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.

It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.

While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

IMPROVED FORM

—OF—

HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

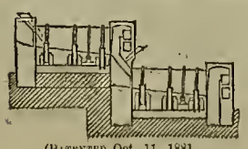
All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

JOSHUA HENDY MACHINE WORKS,

49 and 51 Fremont Street, - - - San Francisco, Cal.

EXCELSIOR BLASTING POWDER,

Manufactured by the



EXCELSIOR POWDER COMPANY.

This is no new, patent, non-explosive Safety Powder, but the Genuine Standard Nitro Glycerine Powder, as safe to use and handle as any other Nitro Glycerine Powder manufactured. The fumes and gases common in nitro-glycerine powders, are destroyed, and do not leave the miner with headache or nausea.

The powder is put up in cartridges of any size to suit the consumer, and is exploded in the same manner as all other high explosives; that is, by means of cap and fuse, or by electricity. It is not claimed for this powder that it is a non-explosive, or safer than other nitro-glycerine powder. All powder, and especially nitro-glycerine powder, should be handled carefully. The EXCELSIOR POWDER is as safe, and for strength far surpasses any other powder on the market. Address all orders to

EXCELSIOR POWDER COMPANY,

Room 9, No. 3 California St., - San Francisco, Cal.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

[ESTABLISHED 1864.]

THE MOREY & SPERRY MINING MACHINERY COMPANY,

Successors to MOREY & SPERRY,

—Manufacturers of all Kinds of—

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York. WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged, we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction. 5 ft. size, weight 7,000 lbs., and does more work than 15 stamps, 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size equired, Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hard Power Two-stamp Mill weight 250 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

MINERS' HORSE WHIM.

ONE HORSE CAN EASILY HOIST OVER 1,000 LBS. at a depth of 500 feet. The Whim is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending the bucket. The standard of the whim is bolted to bed-timbers, thus avoiding all framework. When required, these whims are made in sections to pack on mules.

120 In Actual Use.

Hurdy Gurdy Wheels.

A Record of Scientific Experiments.

Mr. Ross E. Browne, instructor in the College of Mechanics, University of California, has recently made some very careful experiments with hurdy gurdy wheels, which will be of interest to the mining community of this coast. The following article gives the results of these experiments and also a comparison of the efficiency of a Pelton wheel with that of the partial turbine.

These are commonly called "impact wheels," though such a name is misleading, and entirely loses its significance when the bucket is given its best form. When a jet of water strikes a stationary bucket shaped as shown in Fig. 12 or in Fig. 13, as soon as the motion has become permanent, the wedge-shaped portion of the water—shaded with horizontal lines—becomes practically stationary. We have actual impact only for a minute interval of time; *i. e.*, while the wedge is forming. After this the water is simply deflected in its course, and the bucket becomes almost instantaneously a pressure bucket.

When such a bucket is used for a wheel, it is plain that this shaded portion of the water is "carried," and must subsequently escape with nearly the full velocity of the bucket. Its useful effect is therefore very small, as compared with that of the water actually deflected. No advantage comes, then, from impact; on the contrary, serious losses are due to it.

The originally flat bucket (see Fig. 12) has been materially improved:

1st. By giving it curvature (see Fig. 13.)

2d. By filling in the wedge and making it a part of the bucket.

The second improvement brings us to the "Pelton wheel" (see Fig. 19), which is by no means an "impact" but distinctly a "pressure" wheel. By filling in the wedge, impact is avoided. The same thing in principle could be accomplished with the simply curved bucket, by having the jet strike one side instead of the center (see Fig. 14).

A prominent distinction between the Hurdy Gurdy wheel and the Partial Turbine rests in the fact that the former has "open" and the latter "closed" buckets. When properly constructed, the one is no more an "impact" wheel than the other.

The principal sources of loss in Hurdy Gurdy wheels are, in general:

1st. The energy remaining in the water after being discharged from the bucket.

2d. The heat developed by impact of the water in striking the bucket.

3d. The fluid friction of the water in passing over the surface of the bucket.

4th. The loss of head in the nozzle. The loss in the supply-pipe is not charged to the wheel.

5th. The journal friction.

6th. The resistance of the air.

In the formulæ below, all of these sources of loss but the first are neglected; and for the purpose of weighing the importance of curvature in the buckets, it is assumed that all of the water escapes from the bucket with the same velocity; *i. e.*, no water is "carried" with the wheel.

Let c designate the velocity of the bucket in feet per second;

v, the velocity of the jet escaping from the nozzle;

u, the relative velocity of discharge from the bucket;

w, the absolute velocity of discharge from the bucket;

Q, the quantity of water supplied per second in cubic feet;

γ, the weight of one cubic foot of water;

L, the useful work (in foot lbs per second) under the above conditions.

η, the efficiency of the wheel under the above conditions.

g, the acceleration of gravity.

δ, the angle made by the discharge end of the bucket with its line of motion (see Fig. 15).

Then, $u = v - c$

$$w^2 = u^2 + c^2 - 2uc \cos \delta$$

FIG. 12.

FIG. 13.

FIG. 14.

FIG. 20.

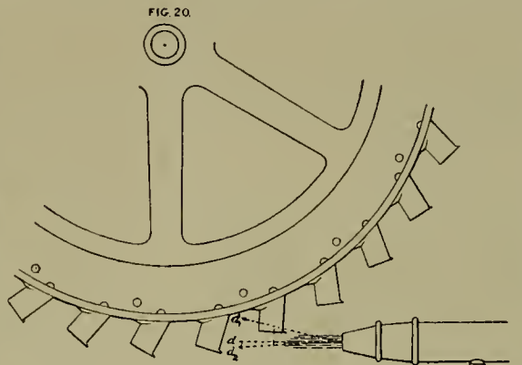

FIG. 16.

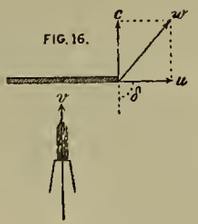

FIG. 19.

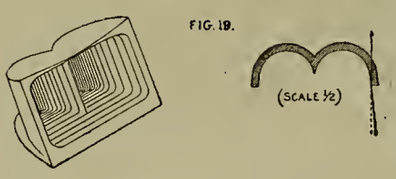

FIG. 15.

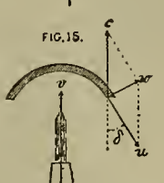

FIG. 18.

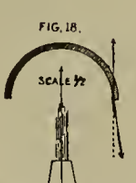

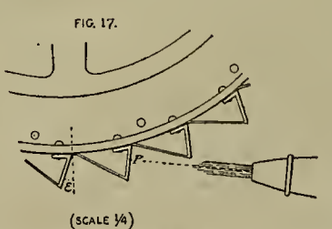

FIG. 17.

BUCKETS OF HURDY GURDY WATER WHEELS.

$$w^2 = v^2 - (2vc - 2c^2)(1 + \cos \delta)$$

$$L = \frac{Q\gamma}{2g}(v^2 - w^2)$$

$$L = \frac{Q\gamma}{2g}(2vc - 2c^2)(1 + \cos \delta)$$

$$\eta = \frac{L}{\left(\frac{Q\gamma}{2g}\right)v^2}$$

$$\eta = 2(1 + \cos \delta)\left(\frac{c}{v} - \frac{c^2}{v^2}\right)$$

And varying the velocity of the bucket, we have for the greatest efficiency—

$$\frac{d\eta}{dc} = 2(1 + \cos \delta)\left(\frac{1}{v} - \frac{2c}{v^2}\right) = 0$$

$$c = \frac{v}{2} \qquad (1.)$$

i. e., the velocity of the bucket should be one-half the velocity of the supply water (the jet) escaping from the nozzle; and this is not very materially modified by introducing the other conditions. Hence the greatest efficiency—

$$\eta_1 = \frac{1}{2}(1 + \cos \delta) \qquad (2.)$$

The smaller we make δ, the greater will be this efficiency.

Flat Buckets.—If the bucket is flat, $\delta = 90°$, hence $\eta_1 = 50$ per cent; *i. e.*, 50 per cent could not be reached with flat buckets, on account of the sources of loss neglected in these formulæ.

A series of experiments were made with such flat buckets (see Fig. 17), with a ¾-inch nozzle.

The curve of efficiency for various speeds, as established from these experiments, is shown in Fig. 23. A ¼-inch nozzle gave results but slightly differing from these.

The highest result was 40.4 per cent, under 50.2 feet head.

The velocity of the jet being approximately $v = .98\sqrt{64.36 \times 50.2} = 55.7$ feet per second, we should have for best efficiency, if the conditions were such as led us to equation (1), the velocity of point P of the bucket, $c = \frac{v}{2} = 27.85$. This corresponds to 6.8 revolutions of the wheel per second, which is marked by a heavy vertical line crossing the curve very near the point of the best efficiency actually obtained.

Curved Buckets.—If δ could be made = 0, we should have, under our assumed conditions, $\eta_1 = 100$ per cent; w would be = 0, and the water would simply fall from the bucket by its own weight. Evidently, then, δ should be made as small as is compatible with clearance of supply-jet and the following bucket. Experiments were made with such a bucket, as shown in Fig. 18 in section, in other respects shaped and set upon the rim of the wheel as the Pelton bucket (see Fig. 20).

A ¾-inch nozzle was used, under head of 50.4 feet. The best result reached was 65.6 per cent. The curve of efficiency is shown in Fig. 23. The heavy line crossing the curve again shows the best speed as calculated, by making $c = \frac{v}{2}$. This marks a speed about one-half revolution per second greater than that actually found by experiment.

The Pelton Wheel.—Mr. Pelton has kindly furnished a pattern from which buckets were cast, and 30 of them attached to the wheel, as shown in Fig. 20. A section and an isometric projection of the bucket are shown in Fig. 19. The angle δ is just sufficient to provide against interference of the discharged water with the buckets following.

The face of the bucket is inclined to the diameter of the wheel.

Experiments were first made with seven different settings of the nozzle. For direction d_1 (Fig. 20) of jet, the efficiency was 68.1 per cent, for d 80.5 per cent, for d_2 78.4 per cent. The nozzle was permanently set to give direction d to the jet.

The efficiency was then determined for various velocities of the wheel:

1st. With a ¾-inch nozzle, giving 82.5 per cent as the best result (see Figs. 21 and 23).

2d. With a ¼-inch nozzle, giving 75.6 per cent as best result (see Fig. 21).

3d. With a 7-16-inch nozzle, giving 82.6 per cent as best result*

Doubtlessly, the nozzle might have been increased to ½ inch without materially reducing the efficiency.

Another set of experiments was made with the ¾-inch nozzle, under various heads, from 50 feet down to 8 feet, showing a gradual decrease in useful effect (see Fig. 22).

At 8 feet, the efficiency still remained as high as 73 per cent. In experimenting with the "curved buckets," the efficiency might possibly have been raised 2 or 3 per cent by attending more carefully to the curve and to the size of nozzle used; still, there was probably a gain of more than 12 per cent due to the introduction of the wedge in the Pelton bucket.

In comparing the three Hurdy Gurdy wheels experimented with, it is evident, from Figs. 19, 13, and 12, that the "Pelton bucket" will "carry" the least, and the "curved bucket" the greatest quantity of water. This "carried" water is the most important of the sources of loss not taken into account in equations (1) and (2); hence the approximate best speed, as calculated from equation (1), differs least from the actual best speed, as found by experiment, in the case of the "Pelton bucket," and most in the case of the "curved bucket" (see Fig. 23). It is perfectly safe to say the Pelton bucket should have one-half the speed of the supply-jet for the best effect.

* In view of the fact that Mr. Pelton claims a still higher efficiency for his wheel, it should be stated that, although he furnished the pattern for the bucket, the wheel does not precisely conform in all particulars to his standard.

(See diagrams and comparison on page 201.)

CORRESPONDENCE.

The Denver Mineral Exposition.

[By our Traveling Correspondent.]

EDITORS PRESS:—In my former letter I took a few steps in the great exhibit, and introduced you to the big engine in charge of chief engineer Fitzpatrick, who has supervision of all the steam power of the establishment, mentioned a few of the mechanical exhibits, and further intimated that there were miles of tables and shelves, pyramids and piles of ores yet to be seen and worthy of mention.

Fine Arts.

But for fear I entirely forget it, I will first say the management have secured a rich treat for the students of art in the large display of paintings and drawings. Pictures? Yes, only pictures! But some of them represent a high order of talent, in the mental conception, and the executive skill of bringing that conception to a real external form for others to view. Next to this was exhibited the photographic specimens of grand views of noted sceneries and portraits of distinguished personages. The great French discoverer and inventor of this branch of art had scarcely a dream or shadow of the greatness or grandeur of his discovery, whose possibilities are yet unmeasured.

This art has given great assistance and encouragement to the art of painting. Passing along, we enter the floral department, where are arranged on stands and shelving the growing plants from the florists' gardens of the city, making a rich perfume that fills the air and seems to say, "A welcome to all." A large watermelon, a few choice native fruits and vegetables form a separate group. The choice cut flowers placed in elegant designs were not a trifling feature of this department. The premiums given in this branch alone already amount to nearly $300. The Commissioners seem to be lovers of fine arts, and believe in encouraging the culture of choice plants and also the art of placing them in a presentable, pleasing combination. We now pass by neatly fitted-up stands, showing

Various Lines of Business,

Each with its neat business card to offer. Here is a seller of mineral specimens and some fancy articles. Next is a large jewelry firm selling and showing up the excellencies of their "boss filled gold cases," several electric belt expounders, and a drug-manufacturing establishment with very fine samples of rare drugs and chemicals, as well as pyramids of fine toilet soap, representing the Denver soap works, and, passing right by the tent-makers' booth, the harness shop, the glove factory, the fur store, the sewing machine exhibits, and all the fancy exhibits of the high-toned Celestial Johns, the fancy card writers and card printers, the gunsmith's fullest outfits of weapons, fishing and hunting tackle, and curious and antique articles of interest.

We now enter a neat little apartment to see the perfect hatcher and a patent mother. The young man in charge, J. Telford, quickly assures us it is sure to hatch out his small plant of eggs in regular time. Near at hand is another hatcher—"Pomeroy's Automatic"—in charge of C. B. Chase. These Eastern inventions seemed to attract very little attention, for near them was an exhibitor of a gyroscope top, which, though a toy, would puzzle some old heads to understand why and how its rapid motion entirely counteracted the force of gravitation and enabled it to do various feats of balancing in the air.

Now, not to notice the cases of State natural history collections, and all the specimens of skeleton and stuffed and bottled reptiles and monstrosities, with rare fossils, relics and antique collections, we will here leave the gallery, conscious of missing the elegant bootbs of many large business houses of Denver, and also without stopping in and registering and getting good ice water at the editorial offices of the three Denver daily presses—*News*, *Republican* and *Tribune*. These great movers of public sentiment and torch bearers have their comfortable quarters in the gallery, where they can look down on the main audience floor, in front of the grand music stand and grand central fountain, and a little more distant see the agricultural pagoda, representing the farms of Colorado. This exhibition is not yet fully set in order.

Having now reached the bottom of the stairs and landed on the main floor again, we turn to the right, to a neat parlor with a cooled fountain of pure cold water, and enough good temperance literature and mottoes to show that this is the Women's Christian Temperance Union parlors. One visible

Effect of Their Mission Work

In this quarter is general sobriety, entire absence of all bars from within the building, and the fact that "the bar" on the outside had lately caused a heavy lattice-work to be erected in front of the open bar, to screen it from public view, as an experiment to see if it would not improve their business. Public sentiment has a weight that is felt for good, and to-day says, reformation is the first step needed in our progress. But we leave this temperance parlor and enter the main hall in the space allotted to the

Union Pacific Railroad Company.

For the exhibit of specimens of the products—agricultural, mineral and game—of the Territory passed over their roads. This exhibit occupies one mile in length of shelving, and everything is planted with care and with regard to convenience of visitors. The center of their allotment has a large spray fountain, over which is sprung a decorative arch. As a background to the shelving, on which were minerals, one carload of farm products, all kinds of grain and grasses were shown to good advantage and to give life-like appearance to the picture. The mounted heads of two deer, two elks, and two buffaloes were shown as just "coming through the rye." The mineral exhibit contained many specimens of mineral springs deposits from Idaho and various other medicinal springs; some very curious, where grass, leaves, mosses and bushes had been changed by action of mineralized waters to stone. There are fossilized fishes from fossil Wyoming, and petrifactions from Hams Fork, Green river. Some of this petrified timber has a hollow center thickly set with polished quartz crystals, some white and some amethyst-purple, etc.

Some specimens had right on the pure quartz some incorporated calcite cubes. One case of fine Colorado ores was shown, and two cases of petrifactions, and some gyserites from Yellowstone National Park. There are also samples from different mines at Wood River, Idaho. The J. Gould shows ores yielding 2,000 ounces silver, and 80 per cent lead. The May Flower has some about the same value. The Idahoan 75 per cent lead, 150 ounces silver; Bullion and Eureka about the same. Among other things shown are Elkhorn ore, cube galena, an 81-pound specimen with 160 ounces silver, and 75 per cent lead; one soft galena specimen weighing 50 pounds, gives 200 ounces silver, and 80 per cent lead. Some fine copper ore and nuggets of very fine copper, one of 80 pounds from Tie Siding, Wyoming. A hollow log 30 inches long with amethyst crystals for lining, from Amethyst mountain, Yellowstone Park. Next 4 large cases of crystals. From this casual glance it is evident that the railroad companies are alive to the importance of bringing the knowledge to the people—knowledge of the wealth-producing products of our own Territory. They show their faith in the country by building roads, and when built, they wish business for those roads, and therefore expend much to show the resources to the world. The well filled heads of grain and the tall corn speak volumes for the farming interest, while the mine workers will make a home market for much that is raised.

The Burlington Route Railroad

Have their grain exhibit in an alcove at the end of the gallery just over the Union Pacific Railroad exhibit. Their shelving has not been filled this season, but their six elegant grain samples, fifty apartment cases of last year, are still in place, and their various labored designs made of wheat heads, corn ears, grasses, etc., are yet looking well, and the various seeds bright and perfect in the cases.

The designer and executor of this exhibit deserved a diploma for excellence and the company credit for employing such talent. As we pass from the Union Pacific Railroad exhibit we encounter next the

Wyoming Exhibit.

Here we meet with a neat compact arrangement of a very grand display. Here stands an upright show case containing choice articles—fossils, gypsum, alabaster, mica sheets, gold, silver, copper, etc. But Wyoming is not satisfied to do fancy work. She piles up the substantial in bulk. Her coal pyramid 4x4, 14 feet high, large samples of granite and marble; sulphate of soda (Glauber salts), three feet by three feet, ten feet high, pure and white from Soda Lake, belonging to Union Pacific Railroad Company. Depth of soda in the lake, fifteen feet. Other locations in Wyoming have still larger deposits of bicarbonate of soda. One of them is reported as one mile long, half a mile wide and forty feet deep.

Graphite or black lead, kaolin, glass sand, mineral paint, irons, etc., were among their heavy exhibits. Then there were sulphur native, sulphate magnesia (epsom salts), asbestos, petroleum, to which add wool, furs and specimens of timber and firewood, and you can gather the range of this little territorial exhibit, but can add a pile of iron made at the rolling mills of the Union Pacific Company.

Their exhibit impresses every intelligent visitor with the fact that Wyoming has great resources, and an energetic pioneer population. In casting my eye or memory back on that exhibit, I recall one article I omitted to mention—a small section of petrified tree of rare beauty, about a foot long and nine or ten inches in diameter, hollow and with a perfectly crystalized quartz center set in a thin shell of opalized wood crystal, which was further incased in petrifaction, making nearly three inches shell. A portion of it was yet incased with an outside layer of sap, a portion of the former tree, now solid rock. The whole would perhaps weigh fifty or sixty pounds. This was much admired, so elegantly petrified and so plainly showing its original tree origin. With these abundant, varied and essential resources and the

Great Railroad Arteries

Of pulsation coursing through this Territory, what can hinder this great section from taking a front rank among the sisterhood of States? It seems as if no element is lacking in the catalogue of her resources for a wealthy and independent community.

The liberal terms of all the railroads in bringing articles to be placed on exhibition has contributed much to the success of this national exhibit. This shows the practical good sense of the railroad managers. They use every honorable means to advance the interests of the Territories through which they have built their roads with their various branching lines. They have brought passengers from St. Louis and other and more distant places, to Denver and return for very low figures, and while here, they have availed themselves of cheap excursion rates to see New Mexico and Colorado. I met some of these at the fair. They appreciated the grand opportunity of seeing so much of the mining ores gathered at one place for convenient exhibit and comparison. Even old Mexico filled a show case with very grand samples of rich silver and gold specimens. Massive silver, wire and moss silver, and leaf silver, also crystalized arborescent specimens of gold from our neighboring States of old Mexico, through which now are two of these great thoroughfare railroads. The Sonora railroad from Guaymas on the Gulf of California, to connect with the Southern Pacific Railroad at Benson, in Arizona. Also the Great Central Mexican railroad joining the Atchinson, Topeka and Santa Fe railroads at El Paso, running 224 miles to Chihuahua, Mexico, where now new energy is taking hold of the old mines, and with the aid of steam transportation instead of the "burro," and all the modern helps to sink deep, and extract cheaply the bullion from the ore, we can but expect an early change in all that Western Mexican life. The better class welcome the new order, and the other classes have not energy enough to oppose a live progression.

Denver, Col. B. W. CROWELL.

Grass Valley and Its Mines.

[From our Traveling Correspondent.]

EDITORS PRESS:—During the past week I have been about this pretty mountain town to a considerable extent, and have gained thereby a general knowledge of its situation and surroundings. I am not going to write its history; only jot down a few items concerning its pleasing features, and also to give you a few brief and concise notes of the mines in this vicinity. The business portion of the town is compactly built, but, like most of the interior and mountain towns, the buildings are the major portion of wood and one-story in height, presenting the usual square gable end to the street. There are, however, many exceptions to this general rule in the business portion of the town. Here there are very many well built and expensive buildings of two stories, constructed of brick and iron, and meant to be to a certain degree fire-proof. The streets are evidently laid out to suit the topography or configuration of the town-site. These run in almost any direction and anywhere. I do not mean to say by this that the streets run like "sheep paths," but to a stranger, at least, they appear considerably "criss-cross," but, nevertheless, are well suited to the hilly nature of the town-site and to the convenience of the inhabitants. The streets abound in artificial shade trees, the white locust and poplar predominating, and so general are these trees that the town seems embowered in them, and presents to the eye a cool and inviting aspect. In the private dwellings of the people the stranger finds most to admire, the neat cottages painted white with their verandas, over which are trailing vines, shading and hiding them almost from view, large and ample yards filled with fruit trees, and vines, and flowering plants and shrubs. How rosy a look they all have; hardly an exception, rich or poor, the owner may be! They seem like birds' nests hidden away among trees and vines. Surely, there ought to be much of happiness to the mates who dwell therein, and I can hardly see how they can help "cooing to each other all the live long day," for the beauty and comforts about them and theirs. They can of a verity sit under their own vine and fig tree with none to molest or make them afraid.

The town is alive with children. I have heard it said, by the people here "that we hardly know where they all come from," (Dame nature, I think, is wiser than they, and could answer the query if she would), "that are in daily attendance at the public schools." The average is about 1,000. The school buildings are commodious and comfortable. The teachers competent and faithful in the discharge of their duties. The churches of the different denominations have attractive and comfortable places of worship, and are generally well attended. The town has an excellent water supply, pure and soft, ample for domestic uses, irrigation of yards and gardens, sprinkling of streets, and use in case of fire. Hydrants to which hose may be attached are at every corner of a block; the pressure being sufficient to throw water high enough for purposes. The town has a well drilled, and thoroughly organized fire brigade, hook and ladder company. Gas is manufactured and furnished to the town for street lighting, and to the citizens who choose to use it.

The Mines in This Vicinity

Are all looking well, and there is apparent a spirit of hopefulness and confidence expressed by all classes of citizens in the stability and continued output of the old mines, and that many new enterprises lately begun in mining will, in a short time, develop paying properties, and that are more than likely to prove the peer of any now working in this district. The Idaho still holds its prestige as the first mine here. It continues to yield the precious metal as of yore, and probably will for many years to come. I need not write of the new and expensive improvements made in the mill and mine by the introduction and use of water power, or of its economic advantages to the company. All this has been but lately given to the public through the columns of your paper and its illustrations. The average output of ore from this mine is about 100 tons per diem. The results of the working of the ore is, I am told, entirely satisfactory to the management and stockholders, and fully equal to any former production.

The Original Empire Mine

Is situated at a locality about one mile southeast of the town of Grass Valley, known as Ophir hill, and was at one time in its history called the Ophir mine. By the invitation of Mr. McKay, the superintendent of the mill and mine, I was allowed the privilege, and in his company of inspecting the working of the mill. The ores of the mine, the dumps, and hoisting machinery together with the improvements now being made in the putting in of new batteries, and the reconstruction of the old mill building, and the necessary addition thereto for the accommodation of the new batteries and self-ore feeders; the raising of the hoisting landing at the mine's shaft, so that the ore raised can be delivered directly to the rock-breaker and ore feeder with the least handling possible, and to the batteries with very small expense of labor. So great and general are the nature of the improvements that they are nearly equal to the building of an entirely new mill, and when completed will constitute "The Old Empire," one of the best appointed mills for the economic and close working of gold ore of any in the State. The output of the mine is steady and profitable, and consequently pleasing to its owners. The mine gives employment in all its departments to a force of 200 men. Outside of these there are working in various parts of the drifts of the mine, and at the surface on small veins or feeders to the main vein; some thirty men as "tributers." This manner of working is said to be profitable to both owners of mine and miners, the former buying the ore at an agreed per cent of the latter. This mine is said to be now in better shape, and to have a brighter showing than at any time before for thirty odd years past, from what I saw I believe that its future is well assured. The management is energetic and able, and its executive officers at the mine appear to be capable, efficient, and prudent in the direction of the mine's affairs.

The Magenta Con. Mine.

This location and mine is not new to fame. It has, like many others in this vicinity, had its "ups and downs," and "black eyes," and in its case, as also in the history of others as well, the fault has not always been chargeable to the mine itself, but has come largely from missmanagement, not to say fraud, for I hold and know from my experience in mining, that a mine can be as easily defrauded out of a good name as an individual, and I doubt not but that many a mine in this and other districts have been so defrauded to their ruin. A mine needs to be dealt with honestly by to flourish, as well as a man. I don't know of very many "black eyes" that mines receive in any other way. A mine may loose its vein or ore, and generally when honesty, perseverance and intelligence have ruled a mine the output is more than likely to be renewed sooner or later. The above mine is said to be a continuation of the Ophir lead. The general character of the rock and ore extracted is the same both in color and granulation of the quartz. A working shaft has been sunk to a depth of 365 feet, following the vein with good rock ore or ore in sight the entire depth. The shaft is double compartment, and thoroughly timbered in a manner to admit the running of cages, pumping machinery and hoisting works, which are now being put up preparatory to the resumption of work and the sinking of shaft to a depth of 1,000 feet. The mine has the confidence of the people here, many of whom are stockholders. Miners at work in the mine also hold largely of the stock. I am told by the superintendent that that within one month after the hoisting works are completed it is expected that the ore then extracted will pay all expenses, and that in time it will rival in its output and dividends "the original Empire and the Idaho mines." The average value of ore that has been extracted in former times was from $26 to $32 per ton. The prediction here is that the Magenta will soon become as profitable and famous as its neighbors.

The Dyer Cannon Ball Quartz Mill.

Among the many mechanical devices presented to the mining public for favor and patronage, the above-named mill is worthy of the attention and investigation of mine owners, superintendents, millmen and others who are interested in the working of gold and silver ores. Your correspondent, having had an opportunity of seeing the machine at work at the "Brunsteter mill," in the town of Grass Valley, believes that it possesses many substantial qualities to recommend it to favorable inspection. Wherever now in use, this mill is giving entire satisfaction. I do not desire or intend to discuss its merits or demerits as compared with those of the stamp mill; the inventor and the manufacturers are able and willing, and probably anxious, to do that. I will, however, venture to say this much in its favor, admitting that other conditions are equal as to effectiveness, capacity, durability, etc. It has at least one great advantage over the stamp battery, viz.:

(CONCLUDED ON PAGE 198.)

MECHANICAL PROGRESS.

The Displacement of Iron by Steel.

Although the tendency to substitute iron for steel may seem to be a hackneyed subject, there are new phases constantly presenting themselves which are worthy of notice. The prophecy has been freely made during late years, that, in a comparatively brief period, the use of iron as a finished product would be restricted to a very limited field, if not altogether abandoned. From about 1876 to 1878 steel gained very rapidly on iron, especially in England, where many new steel works were erected and many iron works were adapted to the manufacture of steel. At that time the iron business all over the world was more depressed than the steel trade, and the end of the use of finished iron seemed to be near at hand. But the last four years have witnessed a decided reaction. The demand for iron revived, and up to a very recent date was in excess of the demand in any former years. Now the hunger for iron has been appeased, and in almost every part of the world the consumption of iron is less than it was a year ago. And here comes the fact which has a direct bearing on this subject, and causes these reflections on the displacement of iron by steel—the consumption of steel appears to have fallen off as much as that of iron.

There is as yet but one line which steel has monopolized, and that is the rail trade. Steel is fighting hard in other fields, but the battle is hotly contested, and the odds are only occasionally in its favor. Steel boiler plates are quite extensively used, but the demand for iron boiler plates has increased in recent years, and the inroads of steel have not been marked by the closing up of iron plate mills.

The production of steel wire has greatly surpassed that of iron wire, but there are grounds for believing that for certain purposes iron wire will always be needed, and that its production must necessarily increase with the growth of these needs, which are in their nature progressive. The use of steel plates for ship-building is unquestionably increasing, but it has not kept pace with the great increase in maritime construction in Great Britain, the shipyard of the world, where more iron plates than ever have, in the recent ship-building "boom," been used in the construction of hulls.

There is a growing demand in England and Wales for steel sheets for tinning purposes, but sheet iron has by no means been supplanted in the manufacture of tin plate or in other lines, either in Great Britain or in this country. Our sheet iron mills have been pressed with orders for years past. The use of bar iron has been unaffected by steel, although efforts have been made to introduce steel for special purposes in direct competition with it. Carriage tires are now made principally of steel, but that is not a trade of very large proportions. Steel beams are occasionally asked for, and there are some shapes which can be made as cheaply of steel as of iron; but general structural forms are almost invariably made of iron. Steel car axles are more widely used every year, but the manufacture of iron axles exhibits no sign of decay. The use of steel castings is becoming more diversified with the advance of time, but the steady demand for foundry pig iron shows that there is still a very large market for iron castings. Steel shafts and forgings are more common than they were some time ago, but they have not completely taken the place of iron forgings, which are still turned out in considerable quantities all over the country.

There is no doubt that the use of steel is growing, and that larger quantities will be used in the future than in the past, but the prophets who have peered so deeply into the future and have so vividly seen the immediate coming of the age of steel have been disappointed in the results so far accomplished. Iron has stubbornly refused to be forced out of use, and the indications are very favorable to the assumption that the country blacksmith, the carriage maker, the car builder, the machinist, the iron founder and their multitudinous co-laborers will continue to use iron for an indefinite period.—*The Iron Age.*

A NEW AND WONDERFUL GUN.—At a lecture lately delivered at the Civil Service Institute in London, Colonel Fosbery created a sensation by suddenly drawing from its place of hiding, under the table, a wonderful new gun, which he had just brought from Liege. He called it a "baby electric gun." It looked like a pretty carbine, but it had no mechanism, and could not possibly go off until connected up to the source of electric force. This done, it could be fired with amazing rapidity, 104 rounds having a few days before been fired from it by its inventor, M. Pieper, of Liege, in two minutes. Col. Fosbery fired two rounds with infinitessimal powder charges. He had prepared himself by secreting under his vest a small circuit of wire and putting on a banderole, supporting what looked like a two-ounce vial, but was, in fact, an electric accumulator, with sufficient stored-up energy to discharge 2,000 rounds. The cartridges were innocent looking mites, and contained no detonating substances—nothing, in fact, but simple powder and a wad.

COMPOSITE NAILS.—The Boston *Commercial Bulletin* learns that the manufacturers of the composite, or as many call them, the iron-clad nail, are meeting with no little success in introducing them to the trade. The composite nail was put upon the market about six months ago. They are made solely by one of the leading nail companies of this State under Wheeler's patent. The nails are practically of steel with an iron outside. They are intended for the same purposes as steel nails, and the manufacturers claim that they are fully as effective for every service as steel nails. They have several advantages over the latter, the most important being that they can be produced cheaper. Whereas, steel nails cost one dollar per keg over the ordinary nails, the composite nails cost only fifty cents more. Steel nails when of good quality have to be manufactured from steel blooms, while in the manufacture of composite nails the iron covering protects the steel from deoxidation, and so scrap steel can be used. Then the iron covering is much easier on the nail making machinery than steel. This is a very important item in the economy of production.

DRIVING MACHINERY BY SAND.—A Western exchange gives an interesting account of the method recently adopted by Mr. J. Townsend, of Virginia City, to run a number of arastras by sand. The arastras are placed in a light sandy field where only sufficient water for drinking purposes and to moisten the ore to be operated upon can be obtained. The sand drives a large overshot wheel, taking the place of water. It was at first Mr. Townsend's intention to run the arastras by means of a large windmill, but as the speed was naturally irregular he adopted the present method. The windmill now runs a belt containing a number of buckets, and these carry sand up to a large tank somewhat in the way that grain elevators carry wheat. A stream of sand being let out upon the overshot wheel causes it to revolve, just as it would under the weight of a stream of water, and thus far the method is said to have been found very successful. When there is considerable wind, sand is stored up for use when calms prevail, and in this manner the mills may run continuously.

SETTING EDGE TOOLS.—In using the chisel and in setting edge tools for work that needs to be finely finished, the most common mistake made by beginners is to use it too long before resetting the edge on the oil stone. Suppose that half an hour's work shortens the blade, as measured by the exact cutting edge, by 1-200 of an inch? To bring the edge once more to its original keenness requires a certain amount of rubbing on the stone, the amount corresponding to 1-200 of an inch on the flat face. In ten minutes' work the blade will be shortened by, say about one-third of 1-200 or 1-600 of an inch, and the amount of rubbing to bring back the edge to the original sharpness after this amount of work is not more than one-third of that needed in the first case.—*Age of Steel.*

UTILIZING SAWDUST.—There is good reason to believe that sawdust will eventually be found of some better service than that of choking up and polluting the waters of our rivers. It has already been applied to several purposes in a compressed form, and we now learn of a still new use to which it has been put. An exchange says: Pine sawdust, highly compressed, has been successfully used to make up center frames of carriage wheels. It is said to be so solid that it will bear a pressure equal to twenty-three tons per square inch. As sawdust has also been used for partitions and bricks, its application to the production of complex carvings and moldings does not seem to be far off.

DISCOVERY OF THE CEMENTATION PROCESS.—It is considered highly probable that the discovery of the cementation process for making steel had its origin in Liege, Belgium. At the commencement of the 17th century, in 1613, a permission to convert iron into steel is found to have been officially accorded to two armorers of Maestricht, a town which then belonged to the Province of Liege. Judging from this, the metallurgist, Karsten, was probably correct in saying that "England, which has now become the school of iron metallurgy, owes to the Continent two great discoveries—namely, that of the blast furnace and that of cementing steel."

ARTIFICIAL stone is by no means a modern discovery. To-day nothing of the burnt bricks of the ancient Egyptians, Scotland, England, Ireland and Wales contain numerous veins of concrete in the old castles of those lands. The Moors have also left samples of their artificial stone upon the rock of Gibraltar, which, have withstood the fury of the climate for over ten centuries. The cisterns of Solomon, near Tyre, erected by that potentate are in almost complete preservation. Many other similar relics are found in other Eastern countries.

JOURNAL boxes are now made which retain the oil, and require replenishing only three or four times a year. Pouring oil on a heated journal is wasteful; water is much better, and is at any time a good lubricant, so long as it retains its place between the journal and the box. Oil, after passing between a heated journal and box, is comparatively worthless for lubricating purposes.

THE AUTUMN MEETING of the British Iron and Steel Institute will be held on the 18th, 19th, and 20th of September, at Middlesboro'.

SCIENTIFIC PROGRESS.

Origin of Nitrogen.

The authors, A. Muntz and E. Aubin, show that the only noteworthy agent for the production of nitric or nitrous acid from the free nitrogen of the atmosphere is the electric discharge. They consider that unless the supply of the oxides of nitrogen thus generated is greater in tropical regions than it has been found to be in Europe, it will be difficult to explain, by electricity alone, the compensation of the nitrogen which is incessantly wasted, and especially the accumulation of combined nitrogen which exists on the surface of the globe. Hence, another cause must be sought for the production of nitrogenous compounds. It has been proved by the experiments of M. Boussingault upon plants, and those of M. Schloesing upon the soil, that neither of these are able to assimilate free nitrogen. Hence, the authors are inclined to seek the source of combined nitrogen in the violent combustions which must have ensued at a certain stage of the earth's existence, when the elements which had been dissociated by an elevated temperature recombined in presence of oxygen and nitrogen, involving the formation of nitrous compounds. It is known, indeed, that large quantities of nitrous acid are formed whenever any body is burnt in air.

According to the authors' experiments, 1 grm. of hydrogen burning in air yields as much as 0.001 grm. nitric acid, while 1 grm. yielded as much as 0.100 grm. Hence, at the first appearance of organic beings upon the earth, there existed a large stock of nitrogenous compounds in the air and the soil upon which we are still subsisting, and which is decreasing under the influence of the causes which effect the escape of free nitrogen, unless the supply is kept up by the action of atmospheric electricity.

COLORING FLOWERS BY ABSORPTION.—We last week gave a short item, which is going the rounds of the papers, in regard to the coloring of flowers by absorption, of which a Mr. Nesbitt, an Englishman, claims to be the discoverer at a recent date. A correspondent of the *Scientific American*, of September 22d, puts in a counter claim, as follows: "In the last number of the *Scientific American*, under the heading 'Flowers Colored by Absorption,' it is stated that 'the process of coloring flowers by the absorption of dyes through the stem' is the discovery of Mr. Nesbitt. Two years ago Mr. C. B. Riker showed me several field daisies colored by placing their cut stems in aniline violet ink. They refused to absorb any color from black ink. Mr. J. M. Foote, of Newark, made experiments of a similar nature twenty years ago, which are even more curious, inasmuch as he colored peonies, as they grew by applying various dyes in solution to the ground in which they stood, obtaining five or six different colors, and also finding them to refuse certain colors. Both the above experiments probably antedate Mr. Nesbitt's.

MODIFICATIONS OF GLASS AT MODERATE TEMPERATURES.—Some interesting communications relative to the changes which thermometers undergo when they are heated for a long time were recently presented to the French Academy. It appears from these that in manufactories of printer's ink, where oils are heated to a temperature of 538° F. for many days, the most accurate thermometers often become so changed as to indicate errors of 10 or more degrees. J. Salleron calls attention to similar changes at much lower temperatures. The areometers, which are employed in sugar refineries where molasses is treated by osmosis, are plunged for many days in liquids which are heated to 203° F. Although this temperature is below the boiling point of water, it is sufficient to completely modify the areometers and to soften the glass enough to make them untrustworthy.

A NEW FUEL.—A Mexican paper gives an account of a new fuel recently brought out in the City of Mexico. The article is called "turbato," and consists principally of bog peat, of which there are immense quantities in Mexico, mixed with a proper proportion of bitumen. The fuel is made for locomotives, stationary engines, smelting purposes, smiths' fires and household purposes. It is said to burn freely, and without much smoke, giving a higher dynamic equivalent of heat than the same amount of wood. It can be manufactured and sold in Mexico at a price considerably below coal or wood, and, looking at the daily increased demand for fuel, the augmentation in the price of wood and its growing scarcity, a large and successful market is considered in store for "turbato."

EXTRAORDINARY DISCOVERY.—The English papers speak of an extraordinary discovery which Dr. Brown Sequard claims to have made. It is an anesthetic which suspends sensation without affecting either consciousness or activity, and may be used for a day, or for a longer period with impunity. In other words, he has "invented" a drug which will enable a sick person to perform all the natural functions and to assist in his own cure without enduring any pain. The exhaustion which comes of intense suffering will be put an end to; but there will be no suspension of those activities the exercise of which are necessary to recovery.

A NEW ILLUMINANT.—Lieut. Diek, of the Russian army, is said to have discovered a new illuminating substance which is capable of imparting luminous properties to objects to which it is applied. It is in the form of a powder, and of three colors, green, yellow and violet, the latter being the most powerful. Water in a glass vessel is by this means converted into an illuminating fluid. In a lecture recently delivered by the inventor of the Nicolai Engineering Academy, at St. Petersburg, he explained the application of the substance to military and industrial mining operations. The illuminating power lasts for eight hours, and the powder must then be renewed. The German Government is said to have lately been making experiments with Lieutenant Dick's invention.

INFLUENCE OF HEAT ON THE PERMANENT MAGNETISM OF STEEL.—According to the *Chronique Industrielle*, some interesting experiments relating to the influence of heat on the permanent magnetism of steel were recently made by Professor Poloni. He finds that the diminution of magnetic intensity by the increase of temperature in the steel bar has no rigid relation to the increase of electric resistance in the metal itself. While the permanent magnetism diminishes with increasing rapidity up to a temperature of 328° F., and then less rapidly up to 508°, becoming inappreciable at red heat, the electric conductivity of the iron diminishes uniformly with the increase of temperature.

LIGHT STANDARDS.—M. Monnier, director of the laboratory installed at Paris (by the gas companies) for the study of electricity, has undertaken a comparison of the existing standards of light. He finds the value of the French carcel to be in English standard candles 8.33; in German candles, 7.5; in Munich candles, 6.5. The standard equivalent values of those in vogue are, for the English, 9.5, and German, 7.6; therefore, some change in this respect would seem to be advisable. Schilling's equivalents to the carcel are, English, 9.6; German, 9.8, and Munich, 8.7. On the other hand, Schilling's measurements give the corresponding values as 7.77, 7.4, 8. 7.

POSSIBLY SO.—Two aeronauts, a Belgian and Frenchman, have recently succeeded in accomplishing the feat of crossing the English Channel in a balloon, so often unsuccessfully attempted. In his account of the voyage, one of the participants says: "Not only the land lay below us like a map, but the bottom of the sea was clearly seen in all directions; every channel and shoal was easily marked, and formed a fibrous network. By the aid of instantaneous photography and the balloon, our knowledge of the sea could be very greatly increased; charts of greater exactness than any existing could be made of the bottom of the sea, at least of shoals shallow enough to offer danger to sailing crafts."

IMPORTANCE OF GREEK AND LATIN.—President Seelye, of Amherst College, says that a four-years' scientific course was organized which a student could pursue with no knowledge of Greek and only a slight knowledge of Latin. After an experience of ten years it has been found that the best scientific students have, in every year, without a single exception, been the classical students, and the college has become so thoroughly convinced that the best work in science is to be done only on the basis of a thorough grounding in the classics that it has discontinued its scientific as separate from its classical course.

EARTHQUAKE RESEARCHES.—A Yokohama paper states that Mr. John Milne, whose researches on earthquakes, as explained by him to the British Association at Southampton, have excited a great interest in scientific circles, and who has since returned to his duties in Japan, has applied to the Japanese authorities to establish an observatory, in order that he may be able to thoroughly investigate underground phenomena. He has sent the authorities a long treatise upon the earthquakes of Japan.

PROF. SIR W. THOMSON, in his new treatise on natural philosophy, is led, by a consideration of the necessary order of cooling and consolidation of the earth, to infer that the interior of our world is not, as commonly supposed, all liquid, with a thin, solid crust of from twenty to one hundred miles thick, but that it is on the whole more rigid than a continuous solid globe of glass of the same diameter, and probably more rigid than such a globe of steel.

A STRONG ELECTRIC LIGHT.—Probably the strongest single electric light now in this country is suspended in front of the *Record* building in Philadelphia, some 90 feet above the level of the street. Its power is equal to that of 10,000 candles.

A NEW FLUX.—A French metallurgist, M. Brunow, claims to have discovered a reducing substance which so promotes liquefaction that by its aid he has melted pig iron in fourteen minutes.

THE iron furnace at Hotaling is having a splendid run this summer. They are making iron with much less fuel in proportion than formerly. They run off every eight hours, or three times a day, an average of about ten tons of pig to the run. Their developments under ground show an encouraging increase in the ore deposit.

Mining Share Market.

Some little activity has been shown in mining stocks this week, although there have been no high prices. In fact, there is little to make a "market" just now. While all has been sufficiently encouraging at the main points of interest in the principal mines, there has not been made any showing of ore that was of sufficient importance to lift the prices out of the old familiar rut.

On the Comstock, the fires have been started in the furnaces at the Imperial, and the shriek of the whistle was heard for the first time in nearly two years. Work will be resumed in the old upper levels immediately. This is quite a boom to Gold Hill, and all that is needed to make that town resume a fair share of its former activity is the resumption of work in the Yellow Jacket, Crown Point and Belcher.

At the Norcross they have commenced clambering out for a station on the 2700 level, and will shortly begin crossentting there.

The water in the Alta is down to the 1550 level. With this level there are connected a number of drifts, the draining of which will probably take two or three days. This is the last level before reaching the bottom of the shaft.

Bullion Shipments.

Contention, Sept. 21st, $14,604; Moulton, 20th, $9,337; Hanauer, 20th, $6,205; Ontario, 20th, $4,197; Horn Silver, 20th, $12,000; Horn Silver, 22d, $24,000; Ontaria, 22d, $8,465; Vienna, 22d, $4,300; Hanauer, 23d, $10,090; Crescent, 24th, $5,175; Ontario, 22d, $4,087; Horn Silver, 23d, $12,000; Alice, 23d, $14,884; Hanauer, 25th, $7,800; Stormont, 25th, $2,630; Horn Silver, 25th, $27,000; Vienna, 25th, $1,450. During the week ending September 22d, there were shipped from Salt Lake 42 cars of bullion, 1,047,409 pounds, sent East; 13 cars of ore, 285,400 pounds, sent East; 8 cars of ore, 129,180 pounds, sent West, and 1 car of white lead, 25,000 pounds, sent West; making a grand total of 64 cars, aggregating 1,486,589 pounds.

THE PRICE OF ALUMINUM.—The statement, widely circulated in the beginning of the year, which obtained credence in some quarters, that aluminum could by a new process be produced at from 90¢. to 100¢. per ton, seems to have been exaggerated. Dr. Wahl, secretary of the Franklin Institute, has reported upon the new method, and finds that it is utterly impossible to produce the metal at anything like the cost named. The only new portion of the method referred to is, he states, that which deals with the treatment of the raw material, which he considers impracticable. The sodium alone required to reduce 1 lb. of metal from the chloride is between 3 lbs. and 4 lbs., and costs nearly 4s., which alone brings the price of the extracted aluminum to about 450. per ton, to say nothing of the other tedious and costly processes employed.

THE State Bureau of Labor Statistics, John S. Enos, commissioner, and Hugh J. Mohan, deputy, has issued an elaborate blank directed to county assessors and other officers throughout the State, which, when properly filled, will furnish the basis of a very valuable report from that department. The circular contains the following: "The bureau is clothed with ample authority under the law to compel answers, but it much prefers to depend upon the good will of the people." There are also blanks directed to employers and employes, with requests that the same be filled out.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alpine.

ISABELLE.—*Monitor-Argus*, Sept. 21: The output of bullion from the Isabelle Co., is begining to encourage the people. Last Tuesday two more bars were shipped, making in all seven bars since the mill was started up about the middle of last month. Considering the report of the recent find of a rich body of ore in the Stella, which is now being milled at the Exchequer mill, we may expect heavy shipments of bullion from this on.

Amador.

SUTTER CREEK.—*Ledger*, Sept. 22: The Mahoney mine matter, notwithstanding the sale of the property under foreclosure of liens, seems as far from settlement as ever. There is said to be about ten tons of sulphurets, worth $75 per ton, now being roasted at the sulphurets works. Sinking at the Amador Con. mine is finished, and cutting stations and getting ready for drifting is now in order.

NOTES.—The rock from the St. Louis claim, crushed at the Kennedy mill, cleaned up between $5 and $6 per ton, it is claimed, for the latter part of the run. The Seaton mine and mill was attached on Saturday by Brinn & Bro., for $1,600. The mine is idle at present. The miners have demands against the company for about $6,000. The Mammoth tunnel is at a standstill on account of water. The contractors worked eleven days, and put the tunnel in 45 feet. They will probably work by hand drill until a supply of water can be secured. The Zeile mill can only run from 20 to 25 stamps, on account of shortage of water.

A DRY TIME.—*Sentinel*, Sept. 19: For the first time in its history the Amador canal is short of water. The Blue Lakes, which have been depended upon to furnish a supply at this season of the year, are unable to respond, owing to the fact that little snow fell in the winter of 1882-83. But five stamps are running at the Zeile. The Supt. is trying to make arrangements to run by steam. The Keystone mine at Amador is already using steam. Matters are again at a standstill at the Jackson mine. It is reported that the crushing paid six or seven dollars per ton.

PLYMOUTH CO.—*Dispatch*, Sept. 15: The Plymouth Mining Co., owning the Pacific and Empire mines, headed by Alvinza Hayward, are making arrangements to construct an immense reservoir, six miles above Oleta. The reservoir will be supplied from the Cosumnes river, will cover two hundred acres, and will require a dam sixty feet high.

Calaveras.

EMPIRE.—*Chronicle*, Sept. 22: The Empire mine, in Old Woman's Gulch, is doing well of late. Since the Cook Bros. have undertaken the management it has been steadily in operation with satisfactory results.

DOC. HILL.—*Mountain Echo*, Sept. 19: The ore in the Doc. Hill mine, now being successfully worked by Findlay and Love, is of immense richness. The vein, at a depth of 50 ft, is 7 ft wide, about 3 ft of which has yielded from $150 to $200 per ton.

GOLD HILL.—In last week's issue, we mentioned that a rich strike had been made in the Gold Hill mine, since which we have learned from authority that 200 ounces of clean gold were taken out in 5 days' time week before last.

BLACK OAK.—This mine is opened by a tunnel 120 ft into the hill, where a shaft 60 ft deep is sunk, in the bottom of which is a well defined lead from 3 to 4 ft wide, the yield of which, by arastra, is from $25 to $30 per ton. The ore contains nearly 10 per cent of sulphurets, assays from which have been made, yielding $280 per ton.

Del Norte.

BALD HILL.—Crescent City *Record*, Sept. 15: The Del Norte Gold Quartz Mining Co., situated on the Bald Hills, seems to be progressing finely. We were shown some quartz taken from there this week, which was exceedingly rich in free gold. The ore was taken from the shaft.

El Dorado.

SPANISH DRY DIGGINGS.—Georgetown *Gazette*, Sept. 21: Rich quartz has recently been discovered near the river north of Spanish Dry Diggings. It is supposed to be an extension of the Sliger, and some of the rock shown us will go away up into the thousands. Mr. Bowers is one of the lucky owners.

DAVIDSON.—*Republican*, Sept. 20: This mine, under Mr. Gross, is proving a valuable property. He ran a crosscut west, about 50 ft from the original works, and struck a large body of fine ore from 3 to 4 ft in width. Mr. Burlingham, the Supt., keeps the mill running night and day, and claims the ore will not work less than $12 per ton.

BALTIC.—*Democrat*, Sept. 22: J. W. Ashton and the Campini Bros. have been prospecting their extension of the Baltic mine extensively. They have sunk to a depth of 80 ft, and at that depth tapped the ledge through a tunnel 200 ft long. The mine has yielded a fine prospect all the time, and they are now figuring on the erection of a Dyer Cannon Ball mill.

Inyo.

BISHOP CREEK.—*Independent*, Sept. 22: A correspondent sends the following: The Sacramento mine closed down eight weeks ago, because it would not pay. Van Eps, the Supt., gave four Mexicans the privilege of working the mine, and this is the result. Four men four weeks, fifteen tons of ore, one arastra, worked by one mule, and one of the four men to drive him; coin in hand, $977.50. The mine speaks for itself.

THE MODOC.—Following is the report of Supt. Fitzgerald: Amount of ores and selected slag at furnace, 259 tons. Iron ore, 32 tons. Wood, 40 cords. Coal, 5,200 bushels, to be hauled; 4,800 bushels coal to tons iron. Would have started furnace, but the teams broke down twice; last time three animals were killed on the grade. Amount of ore from New Discovery so far, 37 tons; assay of fine, 142 ounces; of the coarse, 213 ounces. Am increasing the force as I get room for them. Present output, 4 tons per day. The above assays are averages from every carload.

Mono.

MAY LUNDY.—Homer *Index*, Sept. 22: The only change to note in the May Lundy mine is the increase in the size of the ore vein in the bottom of the new winze from the lower tunnel. The north drift on the 156 level of winze 1 is still carrying a 4-foot vein of high-grade ore.

NOTES.—Work will be resumed in the main drift of the Jackson on Monday. Lake View is turning out rich ore from the west vein. The Gorilla Co. on Wednesday last settled its indebtedness and resumed operations in the mine and mill. Last Sunday Bill Erwin started up his arastra, below the lake, on ore from the Erie and Rose mines.

BODIE CON.—*Free Press*, Sept. 20: During the week ending the 15th, 138.29 tons of ore were sent to the mill, and 157.5 were crushed. The average assay value of the pulp was $27.97 per ton; that of the tailings was $5.47 per ton.

STANDARD CON.—During the past week there were extracted and shipped to the mills 1,389 tons of ore. The bullon shipment was valued at $20,263.69. The east crosscut, 1200 level, is in 540 ft, having been run during the week 20 ft.

Nevada.

CENTENNIAL DRIFT MINE.—*Transcript*, Sept. 21: Supt. Baker, of the Centennial drift mine, near Washington, is having big odds to contend with in putting down the shaft. When the new pumping works started Monday the shaft was 53 ft deep, and 30 ft of water in it. That was pumped out, and sinking has since been going on at the rate of 3 or 4 ft per 24 hours. The water pours in so fast that they have to raise 2 buckets of it to each 1 of dirt that comes up. It is believed by old miners that the great auriferous gravel channel will be reached at from 250 to 300 ft.

NOTES.—*Union*, Sept. 25: The Imperial is putting in a new pump. Work is going on at the Greely-Blackman mine. Good progress is made in new hoisting works on the Magenta Con. The Peabody, adjoining the Gold Hill on the north, has been bonded for two years, and operations are to be commenced this week.

MOUNTAINEER.—*Transcript*, Sept. 26: The Mountaineer is one of the growing mines of the district. About a year ago, when the company began to talk about sinking below the tunnel, they thought it would be necessary to go on the hill 400 ft higher, and putting up hoisting and pumping machinery there, pass down through the intervening space to get where they wanted to. Instead of all this they have gone into the tunnel about 800 ft and are sinking from there, using a water wheel for power, running the material out through the tunnel by cars. This saves much labor and time.

YUBA RIVER TUNNEL.—The Yuba River Tunnel Mining Co., at Hoyt's old crossing, commences this week to construct the big flume that is to divert the water from the river bed. About 300 ft of it will be completed this fall. The tunnel has to be widened near the shaft and the bottom of it lowered at the head.

Placer.

WHISKY DIGGINGS.—Grass Valley *Union*, Sept. 25: The California Copper mine, at Whisky Diggings, Placer county, is to have steam machinery, M. C. Taylor being now in San Francisco procuring the same. A shaft has been sunk 60 ft, in which ore of excellent quality is shown. The headquarters of this company is at Grass Valley, where all of the stock is owned.

San Benito.

GABILAN MOUNTAIN.—*Advance*, Sept. 21: Uncle Henry Watson has returned to Hollister from his hunt in the Gabilan mountains for the lost silver mine that was worked in an early day by the native Californians. Mr. Watson reports that he has not found the old mine but has made a find that will shake up San Benito county in the near future.

San Fernandino.

GARFIELD.—Calico *Print*, Sept. 22: A few days ago a very rich strike was made in the lower tunnel of the Garfield mine. The tunnel is in 190 ft. The body of ore is described as surpassing anything yet discovered in the mine.

MAMMOTH.—The lower tunnel is in 200 ft, at a depth of 250 ft from the top of the ledge. The upper tunnel is in 60 ft. A drift is being run in to connect the upper shaft with the lower one. From 10 to 15 tons of good ore are daily crushed at the Oriental mill.

GOBBLER.—On the side of the hill above the canyon blue ore 10 or 12 ft in width has been uncovered that astonishes all who have seen it. This mine is in the same belt as the Garfield, and undoubtedly will prove as rich.

GOLCONDA.—A vein is being opened that is yielding beautiful ore. We were given several pieces that will assay up in the thousands. It is the intention at this point to drift on the ledge.

Shasta.

BULLY CHOOP.—Anderson *Enterprise*, Sept. 22: J. A. Grant, of the Mammoth, is still crushing selected ore. Owing to the scarcity of water he cannot run over eight hours a day. The Cumberland tunnel is progressing slowly. The rock is so hard that very little is taken out without the aid of powder. The Bully Choop Co. are sinking their shaft as fast as three men can do it. They have been taking out excellent rock. The Davis Brothers, of the Pound Cake, are taking out a larger percentage of sulphurets than any other mine on the hill. The Little Gem is a new location by Whit George and the Haskins brothers. The Daisy, another new location by Geo. Weitemeyer and others, has made a very satisfactory showing.

Sierra.

SIERRA BUTTES.—*Tribune*, Sept. 30: The Sierra Buttes mountain has been penetrated by a perfect network of tunnels. From the time that the ledge was first located, in 1850, it has never failed to yield handsome dividends. The total yield of this mine cannot be accurately determined, but it is estimated that up to 1880 it had yielded no less than $7,000,000. In 1876 the Sierra Buttes Co. purchased the Independence, the western extension of the Buttes lead. The present owners struck a rich lead, and it is now yielding largely. The Sierra Buttes started No. 9 tunnel last year. This tunnel is on a level with Sierra City, and will eventually be run 9,000 ft. At 6,000 ft it is expected the pay ledge will be struck. The foundation for the 60-stamp mill at No. 9 tunnel is laid, and the framework has been started. The total receipts for July were $20,913; total working expenses, $12,825, and $2,311 spent on the ninth level, and $3,071 spent on the new mill. The Columbo mine, west of the Independence, is a continu-

ation of that and the Sierra Buttes lead. Through the efforts of J. P. Deidesheimer, this property was recently purchased by an Eastern Co. for $27,500. The mill, to contain 20 stamps, is being built about 800 ft below the tunnel. It is expected to have the mill in running order by the 10th of November.

RUBY.—*Messenger*, Sept. 22: On Saturday the Ruby Co.'s tunnel struck through into gravel 148 ft from the main tunnel. There is very little water yet, and the bedrock is pitching. About 100 ft further will be run before sinking. The rock has all been blasting, but is getting softer.

FOUR HILLS. The Four Hills mine made a fine shipment of bullion this week. The mill is not running now, owing to there not being sufficient water to supply the engine.

Trinity.

DEADWOOD.—*Journal*, Sept. 22. The latest strike is reported as having been made by Hyer, Dennison & Co., half a mile above Lambert's mill. With nothing but good looking float to commence on, these men started a tunnel and have been rewarded by striking a nice vein of quartz after running 84 ft. In the top of the tunnel the vein is only half an inch, but it widens to 6 inches at the bottom. The parties are confident that they have a big thing.

Tuolumne

SANTA MARIA *Democrat* Sept. 22: John H. Neale, on the Santa Maria mine, near Crocker's station, informed a representative of the *Democrat* that his mine is turning out handsomely. He has a Huntington, Centrifugal, which crushes 5 tons every 24 hours, and saves ninety per cent of the gold in the battery.

LOUIS PAGE, who is mining on the north fork of the Stanislaus, near Five Mile creek, made a handsome clean-up last week.

NEVADA.

Washoe District.

UNION CON.—*Enterprise*, Sept. 22: On the 3000 level the south drift is out about 115 ft from the main west crosscut. It is still cutting streaks of metal-bearing quartz of promising character. The joint Sierra Nevada winze below the 3000 level is down nearly 80 ft. An increased amount of mineral-bearing quartz is coming in at the bottom.

MEXICAN.—The upraise from the 2900 has yet nearly 20 ft to go to connect with the winze down from the 2700 level. The rock is very hard, and the miners are obliged to work under blinding showers of hot water, yet they have thus far managed to make about 8 ft per week.

OPHIR. Good headway is making in the west drifts on the 150 level. As soon as connection is made with the winze going down, a circulation of air will be obtained which will permit of exploring in all directions on the tunnel level, as well as to a considerable depth below that point.

SIERRA NEVADA. North lateral drift No. 1, on the 2900 level, is being extended at the rate of about 20 ft per week. The joint Union Con. winze below the 3000 level is down nearly 80 ft. It is passing through mineral-bearing quartz that has a dip to the east.

SAVAGE.—Preparations for crosscutting on the 2600 level at the south line are being made.

YELLOW JACKET.—All is now in excellent order for the mining of ore as soon as the mills on the Carson river can resume work.

UTAH.—The repairs to the gallows frame and the overhauling of the hoisting engines is completed and work has been resumed in the north drift on the 1350 level.

COMBINATION SHAFT.—The station below the 2600 level for the new hydraulic pump is being excavated rapid y and is now more than half finished.

IMPERIAL.—Good headway is being made in the overhauling of the machinery preparatory to the extraction of ore from the old upper levels commanded by the Imperial shaft.

HALE AND NORCROSS.—The winze below the 2600 level is almost down to the 2700 level, at which point crosscuts will be made east and west.

SCORPION.—Excellent progress is being made in the west crosscut on the 500 level.

CROWN POINT.—Little can now be done except in the way of work preparatory to the extraction of ore when the mill on the river starts up again.

ALTA.—The water has been pumped out to the 1450 level.

GOULD AND CURRY.—East crosscut No. 3 is now being advanced in vein material of favorable character.

CALIFORNIA.—Have finished cutting out the chamber for joint Con. Virginia winze No. 2.

CON. VIRGINIA.—The work of cutting out a chamber for joint California winze No. 2 is about completed.

BEST AND BELCHER.—The west drift is gradually draining out, and work may soon be resumed at that point.

UNION SHAFT. Are still engaged in easing the timbers of the 2300 station.

OVERMAN.—Are extracting some ore from the old upper levels.

BELCHER.—Are awaiting the starting up of the mills.

Belmont District

TWO G.—Eureka *Sentinel*, Sept. 23: There is a mine at Tybo, Nye county, which up to three years ago, when it was shut down, had yielded $6,000,000. We refer to the Two G mine, on which work was resumed, a month or two since by Trowbridge & Co. It has never been prospected lower than 400 ft. At this depth water was encountered and work was stopped. Since starting up the mill the present company have turned out an average of about $500 very fine bullion per day. The run of the last 35 days was over $17,000, with $2,000 or $3,000 of amalgam remaining over. The company, owing to their closer milling, can utilize a great mass of ore in the mine, as well as considerable on the dump, that the former company did not succeed in working at a profit. It looks now as though the Two G has a good prospect of producing another $6,000,000.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Sept. 22: The daily output of ore is about 33 tons. Both mills are running as usual, five stamps of mill No. 2 being engaged on ore from the Great Western mine, in Garfield district. The bullion shipments on September account amounted to $8,122.02 on the 17th instant.

MOUNT DIABLO. The stope above the west drift from the Callison winze is turning out ore of good grade. The east end of the stope is turning out some ore of very high grade from a rather narrow ledge. A shipment of bullion was made on the 13th inst., of $4,803.39, and another on the 17th of $7,733.40.

COLUMBUS CON.—The connection between the shaft and the old workings was made last Thursday, rendering that part of the mine much more comfortable.

Eureka District.

EUREKA CON.—*Sentinel*, Sept. 21. Supt. Read of the Eureka Con. thinks he has a dead shot on reducing the water in the Logan shaft hereafter at the rate of 10 ft per week, according to which calculation the shaft will be dry in five weeks from date, as the flood now stands 50 ft deep. It has taken both the pump and the bailing tank to keep it down until now, but yesterday the pump alone began to hold it level.

Paradise District.

PARADISE MINE.—The Reno *State Journal*, of Sept. 22, says: Yesterday morning Wells Fargo & Co.'s car contained a silver brick from this mine weighing 133 pounds, of the value of $2,580. David Harlan, who arrived in Reno yesterday from Paradise, says that all the mines are looking well, and that the outlook for the camp never was more encouraging.

Pinto District.

FAIRPLAY.—Eureka *Sentinel*, Sept. 20: The recent development in the Fairplay mine, Pinto district, is proving itself a bonanza. Something like 300 tons have been shipped in already to the Richmond works for reduction, none of which has assayed less than $178, while much of it has gone a great deal higher. The last sample lot sent in was 42 tons that went by pulp assay $250 to the ton. The entire 300 tons shipped in will doubtless average $200. Dick Berryman, who is a careful miner, and not disposed to overestimate, says there is from $75,000 to $100,000 worth of ore actually in sight. Three 8 horse teams are running daily between the mine and the reduction works. They each make a round trip, about 17 miles out and 17 miles back, in two days, each hauling 7 tons, the three freighting in a total of 21½ tons every other day. The mine is leased by Kilgore, Dick Berryman and James Oliver for 12 months. They will make a big thing out of it. In fact they have made their "pile" out of it already. There are only 7 men working in the mine, and yet this small force extract the ore, hoist and sack it, and load the three 8-horse teams with it. It should be said that the ore shipped in unassorted, but loaded into the wagons just as it is shoveled out of the ledge.

Safford District.

ZANOLI.—Eureka *Sentinel*, Sept. 19: Col. Tyson, Supt. of the Onondaga mine, Safford district, is at present in Eureka. The company have made up their minds to put up reduction works on the Humboldt. The Zanoli, Col. Tyson says, is looking fine. On the 50 level the ledge has been stripped 45 ft northwest and 45 ft, southeast on a body of high grade yellow carbonate ore. The same work has been done also on the 80 level on which the ledge, perfectly defined and with smooth walls, varies in width from one to seven ft. The mine has been prospected to the depth of 112 ft, the ore going all the way to the bottom. They propose to run a tunnel in to strike below the incline at a depth of 300 ft from the surface to drain the mine. They expect, as in the case of the Onondaga, to erect works of their own on the Humboldt.

ARIZONA.

UNITED VERDE CO.—*Miner*, Sept. 14: The United Verde Co. were recently offered for their property in Black Hills the round sum of $2,000,000, which they refused. The price may seem large, still when it is taken into consideration that several hundred ounces of silver come from each ton of the rock, in addition to the 40 % of copper, with a vein of ore 60 ft in width, it will be readily understood.

PINE SPRING.—Work progresses on the Pine Spring property and the ledge has widened. A depth of 95 ft has been attained, and five ft more is to be sunk, when drifting will commence. Good ore comes from the bottom of the shaft. Shaw & Co. are working an extension of the Pine Spring. Good ore is found and the vein is of good size. There is not a richer district in the Territory than Turkey creek, which is mineralized a distance of 40 miles in length by 20 in width. The Dosoris is on a line with the Pine Spring and is yielding fine ore. Col. Bigelow is shipping $450 ore from his mine. All over this section mining matters are looking up.

SHUT DOWN.—The Tiptop force has been discharged and for the present work suspended. An assessment has been levied.

OLD DOMINION.—Silver *Belt*, Sept. 15: Old Dominion shipments for the week, 767 bars copper—234,885 pounds. Furnace No. 2 was started on the 8th, but shut down the same day on account of scarcity of water. A new well has been dug, and the second furnace will be started to-day. Full supply of coke on hand, and teams arriving daily with more. Bullion 98½ fine.

ARIZONA CENTRAL.—The ore body is represented as about three ft wide and unparalleledly rich, some of it going as high as $18,000 per ton. Such are is not a representation of the ore body, the average, however, of the ore, it is claimed will go $500. The Fame which is near the Arizona Central is also reported as turning out rich ore.

MINERAL HILL.—Pinal *Drill*, Sept. 15: The Alice is under work steadily. They are working on the north croppings and are in fine ore. Assays show high results, and the owners are in excellent spirits. In the Monarch of the Sea they are in fine ore. They have struck richer ore in the Eureka. The Frankfort shaft is down 47 ft deep all in ore. The general sample of 20 pounds selected promiscuously on the dumps assayed $68.43 per ton.

SILVER MOUNTAIN.—*Courier*, Sept. 15. Copper Basin, where C. C. Bean's great mining field is located, is in the timber, 10 or 12 miles southeast of Prescott. Eminent miners have cast their eyes over the properties and pronounced them good. Copper ores exist all through the basin. Mr. Bean will soon have government patents to from 12 to 20 claims. New York parties are anxious to own them, but it is doubtful if he now cares to sell, since it is a proven fact that nowhere else in the world is there so large an area of rich copper ore. Smelters are now being constructed in Chicago to work the ores.

COLORADO.

ROCHESTER.—Pitkin *Independent*, Sept. 15. On Monday we visited the Rochester, the wonderful lode recently discovered on Fairview mountain, and can say that the reports are not exaggerated. The discovery shaft shows the vein 8½ ft wide. On the dump were 15 to 20 tons of fine looking truck, and there were 25 sacks filled with stuff that according to assays runs upwards of $300 per ton. This ore will be among the first to reach the new sampling works, and according to indications the Rochester can be made to yield an output daily from his time sufficient to more than pay expenses of working. The vein is now proved up for a distance of several hundred ft above and below the shaft, in one place showing between five and six ft of ore at grass roots.

BULLION CAMP.—*Mining Gazette*, Sept. 15: The mineral in the shaft of the Argosy lode, Bullion Camp, is increasing in quantity rapidly as depth is obtained. The pay streak is now 8 inches wide, a sample of which assayed 210 ounces silver, and 1¼ ounces gold per ton.

SEVEN-THIRTY. During August the shipments, largely from development work, aggregated 53½ tons of smelting ore, netting $126 to the ton, or about $6,700. At present the main shaft is 390 ft deep from the surface, with four levels below, and three above the crosscut tunnel. These levels are driven at intervals of 60 ft and together measure over 6,000 feet. Just below the tunnel a rich body of ore was stoped for 50 ft, returning $50,000. Adjoining this is a reserve of equal length and apparently the same value. In driving this level, 900 ft, mineral in paying quantities was encountered the whole length, proving the continousness of the vein. In the second level below the tunnel the most recent mill runs have made returns of over $700 per ton.

IDAHO.

SMOKY BULLION.—Wood River *Times*, Sept. 12: The last of the machinery for the concentrator for the Bullion Con. M. Co., in Little Smoky district, was loaded on ox teams to-day, at the railroad depot. Among other things is a tubular boiler 12 ft long, 56 inches in diameter, weighing a little over 10,000 pounds. The entire plant of machinery weighs over 50 tons, there being two sets of rollers, the longest pair 2½ ft in diameter and 16-inch face, and all else in proportion. * * * One of the miners came in from there last night, and reports a grand strike in the north drift from the bottom of the 100-foot shaft on the Bullion mine, and fine ore coming out of the other shafts on the same mine. Tunnels are being run for the vein on both the Providence and Ophir mines, but they are not in far enough to cut the ledge.

RED ELEPHANT.—Mr. Richardson, owner of the Red Elephant group of mines, was in town a day or two ago to look after some ore which he had just shipped to the sampling works. There were 12 tons in the lot, which assayed 100 ounces silver and 60 per cent lead. This was only a sample lot, as Mr. Richardson is not prepared to extract ore in large quantities. Mr. Richardson is confident that the Red Elephant group will yet prove to be the richest mines in the vicinity of Bullion.

SAWTOOTH.—Ketchum *Keystone*, Sept. 12: The dormant state into which this camp has been plunged for the past year was aroused this noon by the shrill whistle and falling stamps of the Columbia & Beaver mill. Messrs. Vernum and Stephens, of the C. & B. Mill and mines, have had a great deal to contend against, having the protested paper of the former management to pay off, and to face the prejudice of mine owners, who regard the new process of leaching as an innovation not to be trusted. The run this fall, owing to the lateness of the season, will in all probability cease about Dec. 1st.

PRIDE OF IDAHO.—Ketchum *Keystone*. Sept. 15: Mr. J. W. Davidson recently had 50 sacks of ore from this mine reduced at the Philadelphia smelters, which gave the following: Silver, 170 ounces per ton, and 50.80 per cent lead; value per ton, $217.81. The number of pounds sold was 6,023, for which Mr. Davidson received $428.98. The Pride of Idaho is a good-sized vein. Its location is on East fork of Wood river.

NETTIE MOORE.—According to the latest report, the miners employed in tunneling to crosscut the ledge, ran into a fine, large body of ore 60 ft under the surface, and in the breast of a 100-ft drift. The ore is high grade galena. This property is on Warm Spring creek.

ATLANTA.—Ketchum *Keystone*, Sept. 8: Atlanta is now enjoying the long since expected boom. At present 200 or more men are working. Two mills (the Last Chance and the Buffalo) are pounding away, and as soon as the Tahoma and Leonora are completed, they will both start up. The Leonora is all under cover, and ready to plant the machinery. The Tahoma is nearly as far advanced. The Monarch is extracting ores of high value. The Last Chance is under full blast, and is still putting on men. The wood and logging contract taken by Althouse & Abbott for the L. C. Co., is fast nearing completion. They, no doubt will continue their work all winter. The Buffalo Co. will resume work in a few days. The Atlanta mine is working a small force and is looking better than ever. Fred Gaetz has struck it rich up Montezuma gulch.

VIENNA. The Vienna mill continues to run with success. The 25th bar was turned out on the 5th inst. These bars weigh from 100 to 120 pounds each, and assay at least 95 per cent.

MONTANA.

PHILIPSBURG.—Butte *Miner*, Sept. 12: A fine shipment of bullion from the Granite Mountain and Hope mines passed through the office of the Express Co. in this city yesterday. Twenty-nine bars over 900 fine, and valued at $66,800, were from the Granite Mountain, and were the result of a 14 days' run of the 20-stamp mill, the average mill return for the run being about 200 ounces. Eleven bars, valued at $10,200, being the output of a 30 days' run of the 10 stamp wet crusher mill, were from the Hope mine.

TIDAL WAVE.—This district is in Madison county, in what is known as the Tobacco Root range. In 1864 work was done by prospectors who were looking for gold. In 1881, working facilities being better, the camp was again propected for silver, and with good success. At present there are a hundred paying prospects, and new leads are being struck every day. Assays may be had from some of them as high as $6,000. The veins are well defined, and for what development has been done, no camp in Montana has a better showing.

BOWLDER VALLEY.—Cor. Helena *Independent*, Sept. 6: Mr. E. Nottingham has sunk a new shaft on his Stockton lode and at 23 ft has struck a body of ore 6 ft wide, with only one wall exposed as yet. The ore consists of galena one ft thick, a sample of which assayed 86 ounces in silver and $35 in gold to the ton, the other 5 ft consisting of good concentrating ore. This lode is opened by four shafts, developing the vein for a length of 200 ft. Mr. Nottingham is driving a tunnel which will tap the vein 125 ft below the surface. The tunnel is 60 ft in, with 90 ft more to run. The "Bobtail," belonging to Nave & Co. is developed by a shaft 70 ft and another 25 ft deep; the pay streak is two ft wide, and produced very fine carbonates of lead on the surface; at the bottom the ore is mostly galena. Several lots have yielded from 50 to 300 ounces in silver to the ton. The Josephine owned by the same parties, shows the same ore. The shaft is 25 ft deep, and at the bottom the vein proves to be 7 ft wide. Currin and Cooke are in luck. While running an open cut on their Alice claim, they unearthed five tons of float, two tons of which, looking better than the balance, were sent to Hill for assay; Mr. Hill returned 199 ounces of silver to the ton. As the cut was only 21 ft long by 3 ft wide, and the claim is covered with the same looking float, the owners estimate that they have 38,000 tons of ore above ground. The Equitable Co., W. M. Mumbrue, superintendent, are representing prospects in this district. Their main force is concentrated on the Willie, on Hyora creek. Mr. Mumbrue showed us assays, among others one of 3000 ounces to the ton.

GLOSTER.—The work at the Gloster mine is progressing rapidly. They have the pan sills in for the new pan mill, the grading is all completed, and the foundation walls of the enormous building (200 by 60 ft and 80 ft high) are all laid. The excavations for the foundation for the 300 horse-power engine are being made. The entire 60-stamp mill with 24 pans and 12 settlers, crushing 180 tons of ore per 24 hours, will be running by the 1st of November.

NEW MEXICO.

LAKE VALLEY. Kingston *Tribune*, Sept. 13: Dr. Endlich returned from Pueblo Tuesday. The tailings shipped, amounting to 9,800 tons, netting the company, clear of all expenses, nearly a quarter of a million dollars. A satisfactory contract has been made with the Pueblo smelter for shipments hereafter. Eight carloads of good ore have been shipped during the past week. The diamond drill has arrived and will be sinking a hole in the Grande near the Roberts shaft. The workings are all looking well. The force of miners has been increased to two hundred and twenty-five in the past ten days. A 25 cent dividend, or $100,000, has been declared on Sierra Grande, and on the same day Dr. Endlich telegraphed the company $50,000 more. The ore shipments have been made of sufficient amount to pay off the entire debt of the Sierra Bella.

MONASKA.—Kingston *Tribune*, Sept. 6: In Nos. 1, 2 and 3 levels, large bodies of ore have been struck within the last ten days, the richness of which surpasses anything yet found in Grant county. The pay streak is twenty-eight inches in width, a portion of which, from eight to ten inches in width, is sacked in the mine and shipped without sorting. Nearly all of the ore requires but little sorting, its character being chlorides, sulphides and bromides of silver. About 60,000 pounds of ore was shipped last month, and there is now sacked and ready for shipment one carload. A piece of pure sulphide of silver was recently found near the contact, showing that there is another deposit that has never been tapped by any of the present workings.

MAYFLOWER.—Correspondent of *Southwest Sentinel*, Sept. 8: Work is being prosecuted as fast as time and money will permit, the main work being put on the Chalchihuites shaft, there being a shaft down fifteen feet with hard quartz, carrying bromide and sulphide, with silver, copper glance and chlorides. The lead is capped with fine birds-eye porphyry, carrying a great amount of iron. In the present hanging wall there is as fine lime carbonate as a man would wish to see. There are 125 tons of good ore on the dump that would pay well if we had a smelter here. I will give you an idea of the magnitude of the most prominent mines. The Chalchihuites mine is twenty-five feet wide at fifteen feet deep and no foot wall. The Gazelle is twenty-five feet solid ledge. The Lucky Mack is thirty feet, at least. The Cyclops is thirty feet, and the Blue Carbonates mine is about twelve feet. On all of these claims $300 mineral can be knocked off the entire length.

SAN JOSE CREEK.—A five-stamp gold mill is to go up in connection with the Mayflower and Clyde mines. The owner of the mines is Wm. Walker, of Silver City. Recently he made arrangements with St. Louis capitalists, giving them a one-half interest in his mines, in consideration of their putting in the mill, giving him a half interest in the same, and furnishing means to develop the mines.

CAMP FLEMING.—*Southwest Sentinel*, Sept. 12: The Penrose Bonanza, at Camp Fleming, is coming to the front. Last Saturday a four-foot vein of rich horn silver was uncovered, which promises to develop into a true fissure.

BEAR MOUNTAIN.—*Southwest Sentinel*, Sept. 15: A rich find in the vicinity of Bear mountain is creating no little excitement. Float, containing large quantities of horn silver, is liberally scattered over the surface, and preparations are being made to go down to find the lead.

UTAH.

SILVER MOUNTAIN.—Salt Lake *Tribune*, Sept. 15: The Silver Mountain mine, Big Cottonwood, is attracting considerable attention. During the past week there has been a decided improvement in the appearance of the mine, and they are now shipping ore regularly. To ship ore and get supplies to the mine, it became necessary to construct a road up the side of the mountain, and this has been done under contract. The road was completed and turned over to the company about September 8th. This ore is hauled to Sandy, 20 miles, at $20 per ton. As it is worth $100 per ton, there is a large margin left for the company. The ore assays 75 ounces silver, $15 in gold and 45 per cent lead.

Grass Valley and its Mines.

(CONTINUED FROM PAGE 194.)

its comparatively noiseless operation when at work crushing ore; conversation in an ordinary tone of voice is not interrupted; no thunder of dropping stamps drown the voice or pains the ear; workmen who attend the machine are in no danger of partial or permanent deafness, as has often resulted to men employed in stamp mills. As a sanitary feature, this point deserves consideration, and ought to recommend it, and this should be "a desideratum" to any contemplating the erection of reduction mills. The above mill was illustrated by an engraving and description published not long since in the MINING AND SCIENTIFIC PRESS, and, I believe, is now advertised by the manufacturers in that paper. Mr. C. H. Hawkins, of Grass Valley, has the sole right of manufacture and sale in the counties of Sierra and Nevada of the Dyer mill. Parties desirous of information, resident in these counties, should make it their business and find it to their profit to call at Mr. Hawkin's mill, at Grass Valley, inspect the machine, and observe it working. This will best enable them to judge of its utility and value as a practical quartz crusher. F. A. WILDER.

Grass Valley, Nevada Co., Sept. 22d.

In The Redwoods.

The San Lorenzo river is the principal stream of Santa Cruz county, so that it is dignified by the name of "river" instead of "creek," though it is not navigable. It rises in the mountain near the summit, only six or eight miles from Congress Springs, Santa Clara county. The head waters, however, are over the ridge on the Santa Cruz side of the mountains. It is here a fine clear stream, flowing steeply until down about Buckskin Lawrence's, where the stream begins to run more level and get larger. From there down it receives constant additions of water from numerous tributaries. First comes King's Creek, flowing down from the summit and about doubling the quantity of water. Several smaller streams come in before the main stream reaches the Bowlder Creek, some seven miles above Felton. At this point Bear Creek joins the Lorenzo, Bear having previously been amplified by its own tributary, Deer Creek. Right opposite enters the Bowlder Creek, a good large stream. Further down the Cyante comes in, as well as several smaller streams. Near Felton it widens and becomes deeper, and so continues to Santa Cruz itself, through where the San Lorenzo flows. Not only the main stream but its tributaries also contain an abundance of trout, and for those who love angling there are no finer places. The scenery along the Lorenzo is very fine. The mountain ridges and canyons are covered with timber. The climate is warm and mild, and in the summer is far preferable to the interior of the State, where it is apt to be too warm.

Above Felton the prettiest scenery is met with. At Bowlder Creek, particularly, there is much in the surroundings that is enjoyable. There are numerous lumber mills at various points, and a large V flume conveys lumber from a long distance up the San Lorenzo down to Felton. The redwood forests of the region are very valuable, and there are immense tracts still available. As is mentioned in another column, the redwood of this State is now highly appreciated abroad and in the East as an ornamental wood, and the California redwood industry is attracting much foreign capital.

During the past few summers, that part of the Santa Cruz Mountains through which the San Lorenzo passes has been greatly sought after by campers. Being comparatively near to San Francisco, it is readily accessible by teams, and it is an abundantly watered region. The narrow-gauge railroad strikes the San Lorenzo at Felton, and hundreds of people camp thereabouts every year.

The water of this creek is very pure and clear. There are many very picturesque spots along its course, which to a lover of nature are highly enjoyable. As the creek enters the Pacific ocean at the bathing beach, Santa Cruz, it broadens and deepens, and row boats may be used there. At this point, too, are numerous bath houses, and many prefer to bathe in the smooth waters of the creek, or "river," rather than in the rollers of the ocean.

Education and Industry.

The annual address at the State Fair was by Irving M. Scott, of this city, a thoroughly practical industrialist, demonstrating by his success in mechanic arts his right to speak about the principles which underlie the general attainment of such success. His address was a fervent and eloquent appeal for the recognition of the value of education in the industries, and his words will be hailed with delight by all those who believe that, to secure better deeds, you must improve the men. It gives us pleasure to present to our readers some of his stirring utterances:

The world has designated medicine, law and divinity as the learned professions, but it is fast finding out that it requires full as much talent and severe study to acquire a proficiency in the art and science of farming as to acquire a knowledge of the distinguished professions.

Modern science, based upon actual experiment, speaks whereof it knows. The science of agriculture consists of useful knowledge derived by experiment and by practice on a large scale. By means of it will depend the development of the resources of California to their fullest extent—to perfection.

Quoting Liebig: "Perfect agriculture is the true foundation of all trade and industry—is the foundation of the riches of States."

It is the highest duty of the individual and of the State to gather, foster and propagate this science, capable of conferring blessings so great and multifarious. How is it to be done?

Bacon, on proficiency and advancement of learning, says: "As water, whether it be the dew of heaven or the springs of the earth, doth scatter and lose itself in the ground, except it be collected in some receptacle where it may by union comfort and sustain itself, and for that cause the industry of man hath made and framed spring-heads, conduits, cisterns and pools, which men have been accustomed likewise to beautify and adorn with accomplishments of magnificence of state, as well as of use and necessity, so this most excellent liquid of knowledge, whether it descends from divine inspiration or springs from human sense, would soon perish and vanish to oblivion, if it were not preserved in books, traditions, conferences and places appointed, as universities, colleges and schools, for the receipt and comforting of the same."

California, appreciating the transcendent value of this most "excellent liquid of knowledge," founded, by the aid of the Act of Congress of 1862, the University of California, of which the College of Agriculture, by the expressed provisions of said act, was to constitute the most important feature. This University is situated in one of the most healthy localities in the State, with ample grounds, tastefully laid out and skillfully cared for; its buildings are substantial and adapted to the purpose for which they were designed; its scientific apparatus is in keeping with the most advanced state of learning; its collection of specimens in the various departments of science are choice and extensive; its officers, professors and tutors compare favorably with those of other Universities. And to this summary is to be appended, tuition free! The doors of this university stand wide open, inviting the sons and daughters of California to enter and partake of its bounteous blessings. The learned professors and their associates are in readiness to cordially greet them, and to lead them by pleasant paths into the rich and beautiful fields of science and art, and to assist them in gathering freely therein the abundant gems of knowledge which increase with usefulness and brilliancy the more they are worn.

In consideration of these advantages and the ability of our farmers generally to give their sons and daughters a collegiate education, it is a matter of surprise that so few avail themselves of the proffered boon; and especially is it a matter of surprise that of the scanty number of students from the farm so small a number study agriculture as a profession, for it certainly offers inducements to the aspiring youth not surpassed by any other occupation in life. Besides, "man is but what he knoweth." It is a fact established in modern science that force as a quantity, is constant, but is subject to change of form. Now he who changes in a fair proportion the form of force existing in wheat, grapes, pumpkins and other products of the soil, in cattle, horses, sheep and goats, into the form of brain force or useful knowledge, is a benefactor not only to his offspring and himself, but also to the public.

The progress of the age demands these changes of force forms; demands earnest scientific work in all the departments of industry, especially in that of agricultural chemistry. The machinery of agriculture has attained a high degree of perfection, and it is a great error that agricultural chemistry should be confined within such narrow limits and be so little applied in practice. The impression is too common among most classes that a collegiate education, instead of fitting one better to perform the duties of life, fills him with self-conceit, chimeras and impracticable notions. This fault, if existing at all, is not in collegiate education, but is inherent in the individual who, inflated with the idea that he is a genius, mistakes the glitter of polished brass for the more subdued lustre of pure gold. Or, who like Ixion, lacking a proper appreciation of his own abilities, allows his presumption and indiscretion to mistake a cloud for Juno! When he shall have completed a few turns upon the fiery wheel, he will be a wiser and a better man, and a more useful member of the community than he would be without education. It is by education that we more fully appreciate how little we know and how much there is to be known. The "Prince of Philosophers," when 84 years of age, remarked: "I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the seashore, and diverting myself in now and then finding a smoother pebble or prettier shell than ordinary, while the great ocean of truth lay all undiscovered before me."

Education not only inspires modesty in the mind of its possessor, but sharpens, strengthens and disciplines the mental faculties for concert of action under the direction of the will; also matures the judgment, so that it is better enabled to counsel the will aright.

Education ennobles the mind, and impresses upon it that all honest occupations are honorable; that in labor, however humble, is enthroned true dignity. Michael Angelo said: "Every block of stone contained an imprisoned angel awaiting some one to set it at liberty."

The educated man, fortified by consciousness of right, rises above all petty conceptions of what might seem menial labor. What matters it if he gathers rags on the streets? So long as it is honest labor it is honorable. The gold for which he sells his rags is as pure and valuable as the gold which buys the rarest gem that adorns a diadem—perchance, the rags are of greater intrinsic value than the gem, for by labor they reappear in the form of paper, to whose fidelity is intrusted most of the business relations of life, billions of wealth, the treasures of art and of science, the records of events, the expressions of our innermost thoughts, and the inspirations of divine wisdom and of goodness. As the sturdy oak is developed from the acorn, the lofty pine and mammoth sequoia from diminutive seed, so the various useful industries, however huge their present proportions, have been developed from small beginnings. Others of like character will spring up, flourish, and, perchance, exceed in magnificence any now in operation.

The educated have an immense advantage over the uneducated in comprehending an industry in its length and breadth, in its minutiæ and entirety, and are more likely to attain success. But education alone is insufficient to secure satisfactory results in any undertaking; there must be native talent at the foundation. A good watch spring cannot be made out of lead, however much it may be hammered, rolled and polished; neither can an efficient workman in any profession be made out of dull inelastic material. The achievements of success are attained, for the most part, by those who understand the relation of things, and hence seldom err in their deductions from any given state of facts. In isolated cases blind fortune may make millionaires of beggars, or beggars of millionaires, but in general man is the arbiter of his own fate. Possessing fair abilities, he, by observation and close study of science and art, is enabled to utilize the forces and materials of nature so as to secure maximum results and minimum cost. Then, and not till then, is he truly practical. A term, too often sadly abused by being employed for purposes akin to that of Æsop's lion's skin—but the fiat of nature has gone forth—"The fittest survive." Lion's skins will not avail their wearers in these days of enlightenment. Different vocations require different orders of talent and culture, and as the kind and fineness of a metal contained in a mineral mass are most readily determined by crucial or cupel test, so the kind and quality of talent of our sons and daughters are best demonstrated by systematic study; according to the kind, quality and quantity of the talent metal they shall yield, will they be estimated in the treasures of the world.

The talent of the child is not due to his birthplace nor the profession of his parents. The farmer's son by talent may be best adapted to the practice of law, or of medicine, or of divini-

SCENE ON SAN LORENZO RIVER, SANTA CRUZ CO., CAL.

ty or of mechanics, or the son of the mechanic, lawyer, divine or doctor may be best fitted by nature to pursue some other profession than that of his parents. Let every legitimate means be exhausted to ascertain the character of the talent with which he is endowed; then cultivate it faithfully. Let not ambition or false pride thwart the plan of nature or will of heaven; for "vaulting ambition which overleaps itself, falls on the other." If he develop a talent and taste to be a blacksmith, wood-worker, or useful mechanic of any sort, or a farmer, let him be blacksmith, wheelwright or farmer, and bid him Godspeed. For they are all the noble sons of honest labor, largely the bone and sinew, nerve, life blood, mind and soul of all that is most useful, beautiful, grand glorious on earth. By their efforts we subsist, the granaries of the world are filled, cottages, palaces, temples of learning and worship, vast cities, are all the work of their hands; the necessaries and luxuries of life are the fruits of their toil, the vast navies and merchantmen are the works of their design and skill. Ye mothers and fathers, throw false ambition and false pride to the shades. Give to your sons and daughters trades and professions fitted to their talent and capacities, and marshal them as live energetic workers in the grand army of progress.

Southern California Silver.

The wheat crop of Southern California gives a pretty good account of itself, but the silver crop of 1883 will vastly exceed the wheat crop. It will be at least double the value the wheat and barley crop combined. During the month of August last there were shipped to China from San Francisco $5,750,000 in silver and but $38,000 in gold. So it seems that we pay our bills of tea and silk, rice and fireworks in silver, and not in gold; while on the other side of the continent during the past seven months we have sent specie abroad to pay our debts for sugar, molasses, fruit, spices, dyewoods, coffee, silks, dry goods, $269,529 in silver. This shows that our silver crop is in demand on both sides of the continent, and is a good thing to send abroad to pay our debts without impoverishing our soil, while the wheat that we send out of the country takes away very important and valuable elements from our farms, and like filching a good name, leaves the possessor poor indeed. The readers of the *Herald* should know that mining pays better in this part of the State than elsewhere according to the outlay; in other words, we are making more money on the capital invested than is made in any Territory of the Union. In mining matters distance lends enchantment to the view. We read of great mining operations in Utah, Colorado, Idaho and Montana, and they seem so large that our modest operators appear small and unimportant. It is the province of the *Herald* to correct these false notions, and show the plain facts. Take the great Homestake mine, owned by J. B. and Louis T. Haggin, in Dakota. It turns out $100,000 monthly—sometimes more, sometimes less. That looks large. But it takes two great mills, one of 80 stamps and one of 120 stamps, to turn out this amount, while there are little 10-stamp mills owned in Los Angeles that turn out $60,000 a month. While a few men in this vicinity get $60,000 a month from ore that yields $100 per ton with a little 10-stamp mill, it requires hundreds of men to furnish ore for 200 stamps in Idaho, on ore that has only averaged $6.85 for the past two years. These facts should be considered by capitalists in making investments. It is not the great mills, with great nominal capital, and a great way off, that pay the dividends, but the quiet, well managed mines that make no flourish of trumpet, but persist in turning out the bullion. There is not the shadow of a doubt but that the people of Southern California, in all their industries—of agriculture, viniculture, fruit culture, and mining—are making a larger profit on their investment than is made in any other part of the country.—*Los Angeles Herald.*

THE aggregate production of coal in Belgium in the first half of this year is officially returned at 9,006,643 tons. Of this production 6,657,896 tons were raised in the Mons district, and 2,348,547 tons in the Liege district. The number of collieries in activity in the Mons district was 82, and in the Liege basin 69, making an aggregate of 151. The production of pig iron in Belgium in the first half of this year is officially returned at 368,502 tons, viz: casting pig, 33,219 tons; refining pig, 270,853 tons, and pig for steel, 64,431 tons. The production of iron in the same period is returned at 228,761 tons, viz: rails and plates, 59,434 tons, and other descriptions, 169,327 tons. The production of steel was 177,707 tons, of which 95,786 tons were cast steel, ingots, etc., and the balance rails, plates, etc.

IT is stated that the commission of the Vienna Electrical Exhibition is preparing iron cases or screens for the protection of those whose duty will carry them into the vicinity of powerful dynamo machines. The very serious mischief that was done to many valuable watches in the early days of electric lightning led to the production of a machine by which the watch was steadily turned in front of a magnetic pole until it was again demagnetized, but it will, no doubt, be more satisfactory to the owners of good watches to avoid the necessity of such experiments.

USEFUL INFORMATION.

Preparing Lumber for Market.

A correspondent of the *Southern Lumberman*, who evidently understands his business, has the following to say to saw mill men who cut lumber for the Eastern market:

We know that trade is dull. We are told of it often enough, goodness knows; but for all that, even if the market is dull, good stock, properly prepared, will always bring a good price. Our saw mill men, and dealers, too, are too much in the habit of shipping poor stock to the Eastern market, and, if they have nearly a car-load of passably fair lumber, they will fill up by putting in a few hundred feet of stuff containing loose knots, or heart on one side, and various other defects, thinking that, as the greater part of the car is good, that the poor will be accepted. Mistaken idea; it will be thrown out, and if they receive any pay for it at all, the amount will be less than the cost of transportation, and thus they lessen the profits on their really fair lumber.

There is no use talking; this matter of properly preparing lumber for the market is an all-important one, and there should be a thorough canvas of the matter between the mill men and the manufacturers. It will result in much good to both.

Let me again say to the mill men: If you expect to realize a good price for your ash and walnut lumber, do not fail to see that it is properly manufactured before it leaves the mill. It must have square edges; sap taken off; leave no boards with hearts in them; trim the ends off square, and to even lengths, and see that it is not split by careless handling; and bear in mind also that thick lumber, one and a half inches and over, must be more nearly clear than thinner boards, if they pass into the grades of firsts and seconds. If you are cutting ash 4 inches thick—do not imagine for a moment that a board with heart showing on one side will pass as merchantable lumber. It will not. Put such boards back on your headblocks and saw them into thinner ones. The writer of this, who handles perhaps as much or more than any other dealer in the country, would gladly be willing to pay a better price, if lumber was brought to him in proper shape.

CARELESS HANDLING OF MACHINERY.—The ignorance displayed by many persons in charge of machinery is amazing. A gentleman who has spent the greater portion of his years in operating, selling and setting up wood-working machinery, ventures the remark that the majority of machine operators are incompetent to fill their positions. To substantiate this he relates numerous incidents coming under his notice, in which either lamentable ignorance or gross carelessness is displayed, and which seem to corroborate his statement. This gentleman finds that in far the greater number of instances, machinery does not work well because it is not kept in good working order. It may be carefully set up in the first place, but a few months' wear, unless under the care of a competent attendant, tends to bring about a very different state of affairs. Machinery that is run at such high speeds as most wood-cutting tools, will not remain in good shape very long if it is not closely watched. A good attendant will not only know when a machine is doing poor work, but will also know why it does so, and will at once proceed to correct the fault.—*Woodworker.*

MUD DRUMS.—The use of mud drums is very general in parts of the country where mud and sediment contaminate the feed-water, the purpose of the mud drum being to afford a separate vessel fartherest removed from that part of the boiler in which the most violent ebullition occurs, into which mud and sediment will subside where it does the least damage, and from which it can easily be removed or blown out. But in nine tenths of the cases of boilers so arranged that have come under the writer's attention, the feed-pipe is connected to the mud drum, and feeds through it to the boiler, which, of course, must keep its contents in a state of agitation, thoroughly mixing up the mud and settlings, assuming that mud or sediment does subside within it during the time when there is no feed on. If so, when agitated by the feed it must be forced into the boiler again, thus defeating the very object of its use.—*Woodworker.*

A NEW BISULPHIDE ENGINE.—What is represented as a successful attempt to utilize the bisulphide of carbon to drive a steam engine is described in the Lowell (Mass.) *Daily Courier*, of August 13th. With the engine and heater in use, the improver, Mr. W. S. Colwell, gets an expansive force of fifty-one pounds per square inch at the heat of 212 degrees, which, in the steam engine, with vapor of water, is *nil*. The claim is made for this motor that the objections heretofore urged against the use of bisulphide of carbon are all removed by Mr. Colwell's methods, which have been carried beyond the experimental stage.

VENEERS.—At this writing, the very latest veneer is called "marble" veneer. It is the invention of a German mechanic. An Eastern journal says it is fire and water-proof, and will not break, crack, peel or shrink. It can be made to imitate any kind of wood, and is especially adapted for wainscoting and like purposes. It can be applied to metal, stone, plaster, wood and cement. Like other new veneers, eminent architects have passed favorably upon it, and it is meeting with "encouraging success."

BELTS.—New forms of belts are constantly appearing. Hair belts are in use in Germany, but their cheapness over leather belts is doubted. A new method of manufacture, applicable to rubber, woven tissues, or gutta percha, consists in making the belt with longitudinal ribs or grooves, to increase its strength and prevent stretching and variations. Still another is to groove one side of the belt the same as saw teeth, then to put these two pieces together, thus obviating warping.

YELLOW OR WHITE PINE.—Although yellow pine is a very handsome wood, and likely to become very popular for certain purposes in the not far distant future, prominent lumbermen incline to the belief, that while the white pine lasts it will rank its yellow competitor in public estimation. Yellow pine is at present entering into many channels of wood-working, and when northern energy is once firmly settled in the southern forests, we may expect to hear considerably more of it than we do now.

THE imports of iron minerals into France in the first seven months of this year amounted to 956,827 tons, as compared with 836,916 tons in the corresponding period of 1882, and 734,404 tons in the corresponding period of 1881. The exports of iron minerals from France in the first seven months of this year were 59,666 tons, as compared with 64,973 tons in the corresponding period of 1882, and 45,400 tons in the corresponding period of 1881.

THE POPULATION OF CHINA.—The Rev. A. P. Happer, D. D., figures out a steady decrease in the population of China. He says the present number of inhabitants cannot exceed 300,000,000. Chief among the causes of the diminution is opium. He believes that the population of India will soon exceed that of China, the latter ceasing to be the most populous country on the globe.

EVIDENTLY inventors think we stand in need of a substitute for the time-honored cast iron pulley. We now have the wrought iron pulley with cast hub and spokes, the wood pulley with cast hub, the paper pulley with cast hub, the wood rim pulley with cast spokes and hub, and several yet to hear from. It looks as if either the inventors of these had made a mistake, or the cast iron pulley must go.—*Woodworker.*

EXPLOSIONS.—It is remarkable, but nevertheless true, that statistics show that over one-fourth of the boiler explosions in this country occur in sawmills, planing mills, and other wood-working industries. Does this large percentage arise from overwork of the boilers, or the incompetency of the men in charge?

GOOD HEALTH.

Diet for Scurvy.

Major General John P. Hawkins, of the U. S. Army, writes to the *American Grocer*, of New York, as follows:

In a recent number of the *Grocer*, that of March 22d, is the following: "It has recently been demonstrated that the apricot posseses more valuable anti-scorbutic properties than any other known fruit or vegetable. The British Government, on that very account, buy dried apricots very extensively." This statement attracts my attention, because it is the affirmation of a new knowledge or experience in the treatment of scorbutus, and further, it is the announcement of the discovery of a thing as true to-day, which the army and navy experiences of long ago and up to a recent period have demonstrated to be false; that is, the theory that any dried fruit or dried vegetable would prevent scurvy, or would cure it after it had been contracted.

The real cause of scurvy, the exact character of malnutrition that produces it is not absolutely known, but this much is certain, that when a person is entirely deprived of food in its fresh state, the tendency to scurvy may naturally be expected, and a scorbutic condition is generally the result, and, this condition is relieved or entirely cured only by the use of foods containing their natural, original juices, unchanged by desiccating processes, or not materially altered by long keeping, and this is the fact, whether the food be a meat or a vegetable. In the case of meat, its greatest efficiency as an anti-scorbutic is when fresh killed, and if the stomach can stand it, best when eaten raw; or if cooked, the process of cooking should go no further than to make it palatable. On the other hand, if the meat has been hung up for some time, if it has been kept long enough to become dried or approximately so, affording opportunity for its natural juices to have changed in some of their elemental characters, it will have largely lost its anti-scorbutic properties.

In the same way the fresh vegetable is best when fresh from the field and uncooked, if it can be so eaten. It is then in its best condition as an anti-scorbutic, and deteriorates or departs from that condition the longer it is kept, for its natural juices are changing day by day during its period of keeping, until finally, in a state of acknowledged decomposition, it loses all the virtues it originally possessed, and is pronounced to be no longer fit for food. The experience of the army of the United States during many years preceding the rebellion, and since then at some of its frontier stations, often deprived for months of any fresh vegetables, has shown very conclusively that there is no form of desiccated fruit or vegetable that can take the place of the fresh article, or that measurably possesses its virtues, all kinds having been tried, with always the same resultant failure. Substitutes for something fresh have proved of small account, except that they have been of benefit as an additional article of food, increasing variety in the diet, which is always beneficial, and thus fortifying the health and enabling the system to struggle for a time against the scorbutic tendency, but the latter is ultimately sure to have its culmination in scorbutus, unless fresh food can be provided for the relief of the impoverished blood, to afford it the nourishment of which it has been deprived.

A Few Rules for Dyspeptics.

1. Eat slowly, masticating the food very thoroughly, even more so, if possible, than is required in health. The more time the food spends in the mouth, the less it will spend in the stomach.
2. Avoid drinking at meals; at most, take a few sips of warm drink at the close of the meal, if the food is very dry in character.
3. In general, dyspeptic stomachs manage dry food better than that containing much fluid.
4. Eat neither very hot nor cold food. The best temperature is about that of the body. Avoid exposure to cold after eating.
5. Be careful to avoid excess in eating. Eat no more than the wants of the system require. Sometimes less than is really needed must be taken when digestion is very weak. Strength depends not on what is eaten, but on what is digested.
6. Never take violent exercise of any sort, either mental or physical, either just before or just after a meal. It is not good to sleep immediately after eating, nor within four hours of a meal.
7. Never eat more than three times a day, and make the last meal very light. For many dyspeptics, two meals are better than more.
8. Never eat a morsel of any sort between meals.
9. Never eat when very tired, whether exhausted from mental or physical labor.
10. Never eat when the mind is worried or the temper ruffled, if possible to avoid doing so.
11. Eat only food that is easy of digestion, avoiding complicated and indigestible dishes, and taking but one to three kinds at a meal.
12. Most persons will be benefited by the use of oatmeal, wheat meal, or graham flour, cracked wheat, and other whole-grain preparations, though many will find it necessary to avoid vegetables, especially when fruits are taken.

GLUTTONY AMONG GREAT MEN.—The fact that some men of genius have been prodigious eaters, in fact gluttons, has lead many to the erroneous conclusion that heavy food is essential for the best quality and greatest quantity of mental labor. A writer, who evidently holds this opinion, ridicules Charlotte Bronte because she became disgusted with Thackeray on seeing him eat, while sitting beside him at the table on the occasion of first meeting him, although she had formerly idolized him and worshiped his productions. Johnson, Dickens, Thackeray, Bayard Taylor, and other characters whom we might mention, were almost as notorious for their gormandizing as for their literary productions, but their literary fame was achieved in spite of their dietic abuses, rather than by their aid. It would be very easy to show that several of the literary characters named were cut short in the midst of their brilliant careers by habitual abuse of the stomach. A temperate life and a simple dietary would have enabled several of them to prolong their lives to the present moment, with increasing ability in the lines of literary effort for which they are celebrated.—*Good Health.*

PERSONS suffering with acid dyspepsia should avoid starchy foods and those containing sugar. Vegetables must be discarded for a time. Sugar and all articles containing it must be wholly discarded. The idea many people have that sugar neutralizes acid, is quite a mistake. The grains can be taken better than other farinaceous foods. Often fermented bread cannot be eaten without distress. Aerated bread, or light unleavened bread in the form of rolls, crisps, or crackers, is much preferable. Toasting until crisp and slightly brown renders bread much less likely to sour. Fermented bread should never be eaten until it is a day or two old.

COLD BATH IN TYPHOID FEVER.—The following paragraph shows more strongly than any argument can the utility of water as a means of subduing fever: "In Lyons, France, the cold bath method of treating typhoid fever has been adopted with marked success. In the civil hospitals the death rate was reduced from 26 to 9 per cent, and in private practice to 1 or 2 per cent." The method of application is fully set forth in the "Home Hand-book of Rational Medicine," published by *Good Health.*

CREMATION IN ITALY.—The immense crematory at Rome is in almost daily use. Cremation is daily becoming more popular, and bids fair soon to dispose of more corpses in the Italian capital than old-fashioned burial.

Passing Events.

Mining news of note is not abundant just now. Reports from the Yukon river, Alaska, tell of rich finds of diggings that pay $150 to the man per day. Other diggings 800 miles up the river are reported rich. How much truth there is in these stories it is impossible to tell.

The railroad men are still in conference in this city, and it seems agreed that the three great roads shall charge the same prices. We record elsewhere the death of a civil engineer who has gained distinction by his railroad work on this coast.

The fairs are still in progress in this city and the interior. Good attendance seems to be the rule. The famous North Bloomfield debris case is again going on in this city. It will be some time yet, however, before a decision will be reached.

QUITE a large number of new members are being enrolled in the Mechanics' Institute. Most of this increase is doubtless due to the plan adopted by the directors this year of furnishing members season tickets to the fair at half price—that is, $2.50 for double and $1.50 for single. The Institute was never in a more flourishing condition. The membership roll contains over 1,800 names. In the library there are 33,000 volumes, of which the circulating department has 16,000.

SUPT. THOMAS, of the old Dominion Copper Co., at Globe, Arizona, reports their August product from one of the Rankin, Brayton & Co.'s 30-ton smelters to be 403,810 pounds, an average daily yield of 13,460 pounds, bullion running 99 per cent. No comments are necessary on such a statement.

Cable Railroad Grips.

An item is going the rounds of the press concerning what is called an "improved cable grip" which is in use on the Brooklyn bridge, New York. The grip appears to be highly spoken of as a great improvement over those used in San Francisco and Chicago, and it is stated that the patent ante-dates all others.

To the casual observer it would seem that if this device of Col. Paine's was so superior to others it would have been in use in San Francisco where the cable railroad system was inaugurated and developed, more especially as it claims to have been the first of the grips.

This, however, is not the case. The Hallidie patent, in use on the Clay street railroad, was patented long before Paine's. It was granted July 6, 1872, and is numbered 129,130. The Paine patent was not filed until December 1, 1875, and was issued February 8, 1876. Hallidie's had been in use some three years before Paine's application was filed.

Two inventors, Hovey and Paine, applied separately about the same time for a patent on a roller grip, and Hallidie also applied, so an interference was brought about in the Patent Office. It seems that when Hallidie first experimented he had tried the roller grip, but had abandoned it for the one still in use on the Clay street road. He afterwards applied for a patent on the roller, probably to prevent others getting a claim. In effect, the decision of the Patent Office was that Hallidie had abandoned his idea, and he was thrown out; Hovey was given minor claims of construction, and Paine obtained the broad claims of the rollers as applied. It must be remembered, however, that the Hallidie grip already in use had rollers on it, and Paine's idea is not the use of rollers alone, but that of breaking on the rollers, or jamming the rollers on the cable. Hallidie's original patent was not affected in any way.

Hovey had very much the same appliance as Paine, in that the rollers grip the cable and no solid blocks are used. Theoretically, this idea is good, and it was not till Hallidie had tried it that he abandoned it in the first place.

The roller grip, therefore, is not new here, but has been tried and failed. Hovey's was tried several months in the fall of 1876, on the Sutter street cable road, when that road was opened. It was found that the rollers damaged the cable much more than the solid die which was in use on other roads. The same frames are now in use, but instead of rollers they carry solid dies. The difficulty with the rollers is this: The pressure is only applied to the cable at points as broad as the bearing surface of the rollers, and there is not bearing surface enough. The ropes get hard on the surface by wear, and the outer wires become quite brittle. With four nipping points the rope is liable to injury, while the broad bearing surface of the long dies causes no damage. This is the practical result, as shown in every day work.

The fact that this style of grip had been used here and failed, was known to the engineers in charge at the Brooklyn bridge, and the directors had the information placed before them long since. It seems strange, therefore, that it should have been adopted.

The experience on the cable roads in this State ought to be of the greatest assistance to others, as we have had several years' trial, and under various circumstances. One thing claimed for the roller grip is that it starts without a jerk. The cars here start gradually unless the engineer is careless. The Market street cable grip, for instance, has its upper die longer than the lower, and it presses the rope gradually on revolving *rollers* before the rope is pressed on to the lower die. When, however, the cable is finally gripped, it is held between two soft iron dies, which give a long bearing. Wood has been tried for this, but failed, splinters getting in between the strands and forming lumps. Brass is no better than soft iron, and is more expensive.

There is no jar or jerk at starting. They start in all sorts of places, among teams and people, and what is more, come to a stop from full speed of eight miles per hour inside of ten feet.

At Brooklyn bridge they have only a grade of three feet in 100. We run here on grades of 18 feet in 100. Our ropes are under ground, theirs above. We are confined by law to a three-fourth-inch slot through which to operate the gripping arrangement; they do as they like. We are required to stop at all kinds of places; they only stop at one station at each end. Our Market street cars run about eight miles an hour. We are told the Brooklyn cars run ten miles. We go through crowded thoroughfares, while they run over a private right of way. Talk is made of their carrying 57 passengers. The Market street cars have been over their grades with as high as 130 passengers on a car, and frequently carry 100.

In view of our experience here, it does not seem that the roller grip is going to be as great a success on the Brooklyn bridge as has been claimed for it.

Hurdy Gurdy Water Wheels.

In this number of the MINING AND SCIENTIFIC PRESS we publish an article on Hurdy Gurdy wheels by Mr. Ross E. Browne, of the University of California. The development of the Hurdy Gurdy wheel is, we believe, largely Californian, and this adds to the interest we feel in a comparison of designs and efficiencies, which shows the Pelton Hurdy Gurdy wheel to be a better wheel for high heads than the Partial Turbine.

The following additional points have been brought forward in this paper and verified by experiment:

1. With any Hurdy Gurdy wheel the best effect (the highest efficiency) is reached when the bucket has approximately one half the velocity of the water jet. The degree of this approximation depends mainly on the amount of water "carried" by the wheel; the less this amount, the closer the approximation. In the case of the Pelton wheel this rule will be found quite accurate.

2. The efficiency of the Hurdy Gurdy wheel with flat buckets (Fig. 17), can only approach 50 per cent in the same sense that the efficiency of the Pelton wheel approaches 100 per cent.

3. The curved bucket (Fig. 18) is a great improvement on the flat bucket (Fig. 17), and the division or wedge in the Pelton bucket is a further improvement of decided importance.

The following paragraph of Mr. Browne's report we append here, typographical exigencies preventing it appearing on the first page:

It is plain that the Pelton wheel, besides giving a higher efficiency than the Partial Turbine, above described, is more easily built, has a decided advantage in the setting of the nozzle, and is not so dependent on the precise size of nozzle used The capacity of either of these wheels may be doubled by adding another nozzle.

A Worthy Journal.

It is probably not necessary to call the attention of our readers to the character of the contents of the PRESS of late, nevertheless it is a satisfaction to do so. We have been giving a large amount of original correspondence recently, from our traveling and local correspondents, and this number shows how interesting such letters are. Our engravings of mining machinery and appliances have been new and very valuable to our readers. Within the past few months we have given a great many engravings and descriptions of appliances of the highest interest to the miner and metallurgist. The articles in last week's PRESS and this number, on water wheels, with full illustrations, are of great scientific and practical value, and no doubt will be appreciated by all mining men.

It is our aim to obtain from every possible source all reliable information on such topics as will interest the miner, metallurgist and mechanic. In fact, the MINING AND SCIENTIFIC PRESS is the only mining paper published which makes a specialty of illustrating and describing the details of mechanical appliances of mining. Bound volumes of the PRESS are of a far more practical value than most books, inasmuch as so wide a range is covered, and all the latest appliances described.

In addition to these things, all the current mining news is given, and a record of scientific and mechanical progress, each week.

It is gratifying to us to know that these efforts of the publishers are appreciated by the readers. Yet there are many mining men who should be constant readers of the PRESS who do nothing toward upholding it. It is not too much to ask of those who are readers to call the attention of others to its merits. The better our patronage, the better journal can we make. The impartial judgment of any intelligent man will lead him to appreciate the PRESS, should he but glance over the columns of a few numbers. The assistance of old subscribers is therefore of great advantage to the paper, and we shall be very glad to have it whenever opportunity offers.

New Concentrator.

David H. Anderson, of Butte, Montana, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a new form of ore concentrator, which consists of a series of circularly moving and rocking pans placed on descending steps, each one receiving the discharge from the one above it, through suitable gates, chutes, and receivers; and in connection with these, suitable mechanism is employed to operate them.

The pulp is let into the upper pan, and distributed and settled by the peculiar motions imparted to it, the heavier particles settling to the bottom and the lighter arranging themselves above, and flowing through the openings at the side into the distributor, and thence into the next pan.

If it be desired to amalgamate the free gold and silver at the same time that the concentration is being accomplished, mercury may be placed in one or more pans. The heavier metals—gold, silver and mercury—will thus remain at the bottom of the first pan, and the lighter metals (if there be any), sulphurets, sand, loam, or other debris, will be discharged through the distributor into the next pan, where the heaviest will be again settled, and so on to the end of the series, so that all the different grades and values will be separated at one operation.

In some cases a parallel circular motion may be given the pans, and in others a compound circular motion. Either can be given by the mechanism provided for it. The object of the parallel circular motion is to move the vessel equally in all directions, thereby imparting to the pulverized ore, sand and debris, an even movement as they pass over or through the vessel. The object of the compound circular motion is to agitate the passing material, mostly in a sidewise or oscillatory manner, around the center of the pan, while creating but little motion in the direction in which the material flows across the vessel. This movement is specially useful for saving the lighter metals, and gives the machine a better settling action, which the inventor terms the "parallel motion."

Mexican Iron Ore.

Several tons of iron ore were brought to this city a few weeks since from Mexico, with the expectation that it would be utilized by the Pacific Rolling Mills. The ore is found at a place called Tepuche, ten miles from Culiacan, which city is thirty-eight miles from Altata, the seaport, 130 miles north of Mazatlan. The ore runs about six to eight per cent metal, and there are large quantities of it. It assays better than the product of the Iron Mountain, of Durango, Mexico, there being more iron and less phosphorus. There is so little phosphoric acid that steel can be made directly from the ore.

The mountain from which this comes is in the midst of a hardwood forest, so there is plenty of fuel. It is in a limestone country, also, a very great advantage. Both fuel and labor are cheap. A railroad has been in operation for a year between Culiacan and Altata. The latter place has a good inclosed harbor, though there is a bar with but from fifteen to seventeen feet of water, all properly buoyed. Once inside this, there is plenty of water for vessels.

The demand for iron on the Mexican coast is constantly increasing. The duties on all classes of manufactured iron are high, so it would probably pay to establish works for making iron. Our informant, Mr. J. D. Schuyler, General Superintendent Sinaloa and Durango Railroad, thinks the iron can be made there to compete in this market. An experienced iron worker from Tennessee, who examined the iron and the deposit, is certain that pig can be turned out for $12 per ton. It would cost very little to put a tramway or branch railroad from Culiacan to the deposit, there being a level valley only to traverse.

There are a few other iron deposits similar to this in the same region. There is one twenty-five miles from Culiacan that assays even better than this to which we have referred. Nothing has ever been done with the iron deposits of that country. There are only two or three iron smelting plants in the whole of Mexico. Iron made in the locality mentioned would be very cheap for the whole Mexican Pacific coast, being free from duty. There is now a line of steamers on the coast, and next year the service will be increased.

A Portable Furnace and Assay Outfit.

Something new, practical and cheap for prospectors and assayers is Tappeiner's combined portable assay furnace and assay outfit. The furnace, which is shown in the engravings, is made of sheet iron, with three openings in front. One of these is for the muffle, one for inserting picks and drills for sharpening, and the third to reach the ash pit. Each is provided with a hinged door. The furnace is twenty-four inches high without the pipe, and ten inches in diameter at the largest or swell part. It is lined with fire clay fastened so it will not crack off. The form is tapering, with the largest diameter near the top, so as to give room for the muffle and crucibles where most needed. There are four joints of pipe reaching six and a half feet above the furnace, made tapering, so that the four joints telescope one within another, and all are placed within the furnace small end down while being transported, and held in by the furnace cover, which is provided with a suitable fastening.

Ready for Use.

The lower or larger section of the pipe has a large door through which to feed coal and remove crucibles. The pipe projects vertically from the center of the furnace top so there is a direct upward draft. The base of the furnace is broad to give it steadiness, and is braced by strong iron rings inside, so as not to be crushed in transporting.

The following assay implements, etc., accompany each furnace, and are all packed within the furnace in and around the pipe, so the furnace occupies no more room when packed than before: A hammer, iron mortar and pestle, magnifying glass (for examining ores and reading graduations on button-measuring scale), brass wire sieve (No. 60 with tin frame), pulp scale, four No. 7 English crucibles and three covers, pair of combination tongs (for lifting crucibles, scorifiers and cupels), assay pouring mold, iron muffle, iron cupel mold (1¼ inch), tin box and can for crucibles and scorifiers, scale for measuring silver buttons, half a dozen test tubes, pair of wooden test tube tongs, bottle of C. P. nitric acid packed in a tin box with a screw cover, three tin flux boxes with covers and partitions for eight fluxes. The following fluxes also accompany the outfit: litharge, bicarbonate soda, borax, chloride of sodium, argols, bitartrate potass, borax glass, and granulated lead.

Packed Up.

A book of instruction also accompanies each outfit, describing the use of the implements and fluxes and mode of making and calculating the assays of gold, silver, lead and copper. John Taylor and Co., 118 and 120 Market street and 15 and 17 California street, of this city, are the sole manufacturers and agents for this furnace and implements under the patent for the United States. The price of the outfit complete is $40, so it is not too expensive for prospectors.

IT is stated that San Francisco parties have bought the Eureka Con. Mining Co.'s slag pile at Eureka, Nev., and that the entire dump will be run through a new style of furnace again. It is estimated that there are about 1,000,000 tons of slag in the dump, which may pay handsomely, as when the furnaces were first started the process of smelting was crude. Tests of the new process will be made with the present furnaces of the Eureka Con., and if satisfactory, new works will be erected immediately.

OUR PRODUCTS.—During the first eight months of this year the through freight of the Central and Southern Pacific Railroads have included the following amounts of mining produce: Borax, 2,315,700 pounds; copper cement, 599,400 pounds; pig iron, 263,700 pounds; lead, 1,962,300; quicksilver, 252,600. This went from this State to the East.

Mining Debris.

A short time since we gave the resolution adopted by Sacramento officials, asking the Secretary of War to withhold the money appropriated by Congress for improving the river where mining debris is dumped. The following resolution, adopted by the Board of Trustees of Nevada City, Nevada county, in this State, are of exactly the opposite tenor:

Resolved, That the mining in this county is an industry of paramount importance to our people, and if the efforts of the anti-miners in a portion of a few valley counties are successful, our greatest industry will be closed and our county depopulated, and a large portion of our hard-earned wealth and the comfort of our people will vanish.

Resolved, That we point with pride to the result of our mining industry in the shape of flourishing cities and villages, as well as to our numerous school houses and comfortable homes which are scattered broadcast over our broken and rough territory, and we challenge the State to exhibit more industrious and law-abiding people than are found in the mining counties of this State.

Resolved, That our people feel that mining in any shape is a lawful industry, and we deprecate in all ways as unworthy the acts and efforts of the Anti-Debris Association to prevent the Secretary of War from allowing the appropriation of Congress to be applied towards the amelioration of the injuries which our industry may have caused to a limited number of the citizens of the State in the valley below us.

Resolved, That an industry which has turned into the channels of commerce the sum of $1,200,000,000 in gold, and which can furnish a still larger sum, is certainly worthy of protection by our government, which has in all ways profited so largely by it, and which has as yet never contributed one dollar to its aid or protection.

Resolved, That we consider it the duty of the Secretary of War to allow the appropriation made by Congress to be speedily applied to the object for which it was set aside, and that we thank the generous miners on the Yuba for their frank offer to the government to furnish $125,000 (if the government will furnish an equal amount), to be expended, by the War Department, on the Yuba river, in constructing dams for impounding debris, which we know by the examination of unprejudiced engineers is practicable.

FIG. 21.

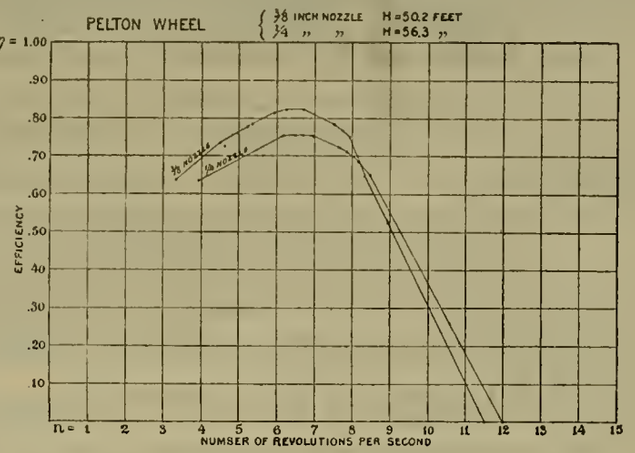

FIG. 22.

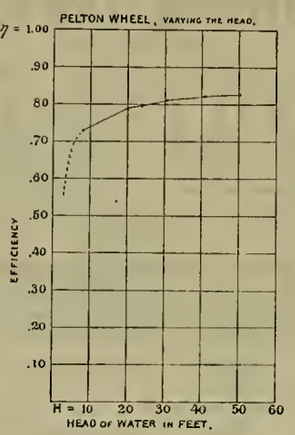

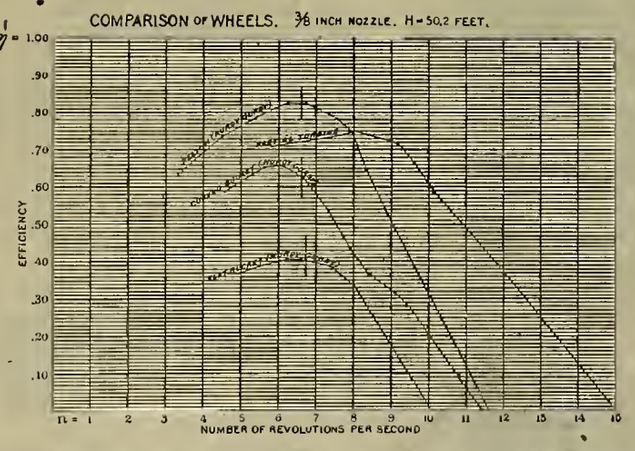

FIG. 23.

DIAGRAMS SHOWING WORK OF HURDY GURDY WHEELS.

IT is reported that Alvinza Hayward has purchased B. S. Tyler's farm on the South Fork of the Cosumnes river, and intends building a dam across the river to furnish water for his Plymouth mines during the dry season. The dam will be 40 feet high with a 300 foot base.

WE shipped East this year 132,500 pounds of nails.

Blasting in Mines—No. 9.

Charging and Firing.

The operations of charging the holes and firing the shots demand particular attention when machine labor is employed. Holes bored by machine drills cannot be placed or directed strictly in accordance with the requirements of the lines of least resistance; on the contrary, these requirements can only be approximately complied with, and in some cases must be wholly neglected. To compensate in some degree this defect of machine labor, the strength of the charges should be varied according to the resistance which they will be required to overcome. That is, the principles of blasting described in a former number, which cannot be complied with by the borer, should be strictly followed by the blaster in apportioning his charges. By this means, a great saving of the explosive compound may be effected, and that without difficulty or loss of time, if the blaster be intelligent and understand his work. A glance will be sufficient to show what charge a given hole of a known depth will require, and as cartridges of different sizes are ready at hand, no delay is occasioned in making up the charge. The holes in the center, which are intended to unkey the face, will of course require the heaviest charge, since the conditions are there most unfavorable to the effects of the explosion. And the more complete the unkeying resulting from this first explosion, and the more fractured and jointed the rock surrounding the cavity thus formed, the more may the charges placed behind these unsupported faces be reduced.

As economy of time is in machine boring the chief end to be attained, the tamping should be done with dried clay pellets previously prepared. This material gives the greatest resistance, and thereby insures the maximum of useful effect; and if prepared beforehand, in the manner described in the preceding chapter, the time consumed in tamping will be reduced to a minimum. An abundant supply of such pellets should always be ready at hand. In downward holes, such as are used in shaft-sinking, the plastic clay pellet and sand may be employed. This tamping may be put in very rapidly, and, in all but very shallow holes, it is very effective. When it is desired to use sand tamping in horizontal holes, and holes bored in an ascending direction, the sand should be made up in paper cartridges. The tamping employed in the St. Gothard tunnel consisted of sand prepared in this manner. At the Mont Cenis tunnel, an argillaceous earth was similarly prepared in paper cartridges for tamping.

Firing the charges also affords an occasion for the exercise of knowledge and judgment. A skillful determination of the order in which the charges are to be fired will in a great measure compensate the ill effects of badly placed holes. The firing of a shot leaves the surrounding rock more or less unsupported on certain sides; and it is evident that to profit fully by the existence of these unsupported faces, the succession of explosions must be regulated so that each shall have the advantage of those formed by the preceding shots. This condition can be wholly fulfilled only by simultaneous firing; but when the firing is to take place successively, the condition may be approximated to by regulating the succession according to the indications observed in a careful inspection of the rock. Before firing the charges, the blaster should consider the relative positions of the holes, the stratification and jointing of the rock, the fissures caused by the preceding blast, and any other circumstances that may influence the results. The charges intended to unkey the face will be fired first, and those in the concentric series will then be fired in the order determined upon, by means of different lengths of fuse. The series will follow each from the center outwards. When a large number of shots regularly placed in series have to be fired, a convenient practical means of insuring the successive explosion of the series, in the case of the whole being lighted simultaneously, consists in bringing the fuses from all the shot-holes together in one point at the center. This method of regulating the length of the fuses was adopted at the St. Gothard tunnel.

MINT DIRECTOR BURCHARD states that from his recent observations and information he has received, he thinks this year there will be a slight decline in the yield of gold, and an increase in silver over last year's production.

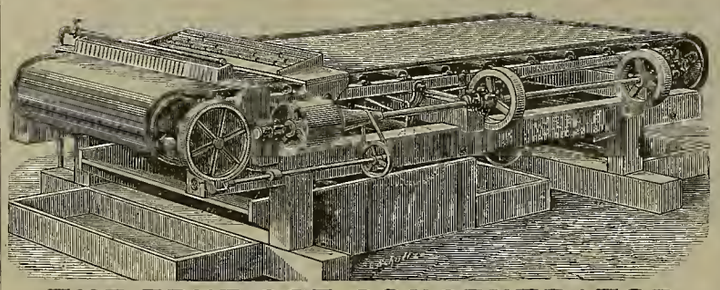
J. W. QUICK, MANUFACTURER.



Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving unversal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to

82 Fremont Street, San Francisco

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorety, 529 Commercial St. S. F.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

JOINT FOR EARTHENWARE PIPES.—John S. Tibbals, S. F. No. 285,179. Dated, Sept. 18, 1883. Earthenware pipes and others of like character are generally made in sections of varying length, each having a straight end and a flaring end, the latter of which is known as the "flange." In laying such pipe, the straight end of one is inserted in the flange of the one adjoining, and the two are held together by cement filled in between so as to form a tight joint, but this joint is imperfect as far as holding the pipes together is concerned, for with a sudden force in the direction of their length, the joint, having no other security than the adhesion of the cement, is apt to be loosened. The object of this invention is to provide a joint adapted to resist such force and at the same time to be perfectly water-tight. The invention consists in flanges or shoulders molded, cast, or secured on each section of pipe near each end, and in a cap or covering bolted over the joint and fitting behind the shoulders. Cement intervenes, and is molded tightly to its place by the cap,

BACKWATER GATES AND SEWERS.—John S. Tibbals, S. F. No. 285,180. Dated, Sept. 18, 1883. This is a new and useful gate to prevent tide-water, etc., from backing up into the sewers, or to resist any hydraulic pressure which may be applied in flushing, and it consists of a swinging valve within a pipe or casting let into the sewer and adapted to close the passage and as a means for operating said valve, consisting of a float and mechanism connecting it with the valve, said float being within a water box connected with the lower end of the pipe whereby the rise of the water will operate to close the valve. The object is to provide simple and effective means to prevent the water from backing up into the sewer when the tide rises or when the flushing is in progress.

BUNCHING SHINGLES.—Anson L. Munson, Fresno, Fresno Co., Cal. No. 285,152. Dated Sept. 18, 1883. The object of this invention is to facilitate the process of dipping to which the the shingles are subjected to coat them with paint or other protective material. The method of bunching consists in placing between the shingles and on the line of their lap or bond, a number of transverse slats or stringers. The present manner of bunching shingles is to lay them one on another from each side with their laps touching, and then to bind them firmly together with the clamp or yoke, which is well known. This makes a solid and compact bunch, and is well enough where the dipping process is not resorted to. But for this process the yoke must be removed, and each shingle dipped separately, and the difficulty cannot he remedied so long as the present manner of bunching shingles continues. The present bunch cannot be dipped as a whole because the shingles are bound so firmly together that the paint will not reach their surfaces. In this way of bunching the paint enters between the shingles, and the entire surface of each up to its lap is exposed to its action.

AUTOMATIC SAFETY HATCH FOR ELEVATOR SHAFTS.—Henry Albert, Newcastle, Placer Co. No. 285,097. Dated September 18, 1883. The object of this invention is to cut off or separate each floor by automatically operating hatches, to prevent the spread of fire or the communication of drafts and fumes, and to avoid accidents by persons falling through the elevator-shafts. The improvements consist of a two-part hatch at each floor, mounted on friction rollers, and meeting in the center of the shaft when closed. These batches are separated by V-shaped cams on the traveling eage, and returns to position by force of gravitation. They are so constructed that while gravitating together they shall always lie in a horizontal plane.

CULTIVATOR.—Harvey Wilcox, Los Gatos, Santa Clara Co., Cal. No. 285,193. Dated Sept. 19, 1883. This is an improved apparatus for cultivating the soil, which is specially applicable to land between rows of trees, vines, etc., and upon hillsides, and it consists of a frame having teeth or a cutting blade or blades, and a rigid pole or shafts for the attacbment of a horse. In combination with this is a rolling cutter or colter mounted on one end of a lever, so as to travel in the ground near the cutter or cultivator, while the upper end of the lever is adjustable from right to left, and may also be moved vertically, to throw the colter out of or into the ground.

PAINT.—A.L. Munson, Fresno, Fresno Co. No. 285,151. Dated September 18, 1883. This paint compound is specially adapted for painting roofs, dipping shingles and for use as a cement. It consists of coal tar, litharge, hydrochloric acid in which zinc is dissolved, plumbago, asphaltum, varnish and gasoline in certain specified proportions. It protects exposed metallic surfaces, preserves wood, may be used in coating cemented walls, and as a coat for brick walls. It is water proof, has no odor, is not affected by beat, and will not crack.

DRAWERS.—Geo. Wittman, assignor to D. Nustadter, San Francisco. No. 285,195. Dated September 18, 1883. This improvement in drawers for underwear consists in a means for re-enforcing or strengthening the front opening at the point where the sides meet; and it also consists of two independent facing strips extending down upon opposite sides of the front opening, and having tongues which extend across and overlap each other just below the meeting edges of the opening.

PORTABLE CHIMNEY.—L. E. Clauson, S. F. No. 285,112. Dated, Sept. 18, 1883. This improvement in chimneys consists in the formation of portable sections of pottery made with inclosing metallic easings, these sections having uniting couplings, and in connection with these sections, thimbles into which stovepipes may be inserted.

IMPROVED WATER DISTRIBUTION.—At Redlands, San Bernardino Co., I believe the experiment was first tried of distributing water to irrigators through a complete system of concrete pipes. The plan has proved a most pronounced success. Southern California owes much to the Messrs. Judson and Brown for demonstrating that a constant flow of one inch of water under a four inch pressure is amply sufficient to irrigate thoroughly eight acres of land. The fact is of great value to our part of the State. I believe there is no colony in the State that has a more satisfactory water system. This is appreciated by those who know that in our climate water is more valuable than land. Now, Redlands has a splendid soil, a charming location, and a climate unsurpassed, but probably its unrivaled water system has had more to do with its rapid progress than any other one item.

The young trees and vines are strong and vigorous. The soil of this colony is peculiarly well adapted to the Muscat grape, the orange and the apricot. Most of the land is sold and is being rapidly brought under cultivation. The colony is well supplied with storage reservoirs so that it is never necessary to irrigate of nights or on Sunday. When will the older settlements profit by her example?—*Cor. Los Angeles Express.*

FOREST fires north of Santa Cruz are doing great damage. Virgin forests of redwood, tan-bark oak and thousands of acres of feed, besides cordwood, shakes, pickets, etc.—in many cases the fruits of mouths of labor of poor men—have been destroyed.

Death of an Engineer.

S. S. Montague, widely known on this coast as Chief Engineer of the Central Pacific railroad, died this week at the end of the track of the California and Oregon railroad beyond Redding. Deceased was about fifty years of age, and leaves a wife and family of children living in Oakland. He entered the employ of the Central Pacific Railroad Co. early in its history as assistant to Chief Engineer Judah, who died shortly after the commencement of the company's great work, and surveyed the route across the Sierra. In making this route he accomplished feats then without a parallel in railroad engineering, gaining an elevation of seven thousand feet in seventy or eighty miles and dropping down three thousand feet in twenty-five miles into the Truckee basin. He was Chief Engineer of the San Joaquin valley railroad as far as Gosben, and the California and Oregon roads, his death occurring while at work exteuding the latter road north into Oregon. He selected all the routes, ran all the lines and made all the grades of these roads.

The Central Pacific is an enduring monument of his engineering genius. English surveyors had come over here, and after seeing the obstacles to be overcome, and the nature of the country the road was to traverse, announced its accomplishment an impossibility; yet to-day the cars round "Cape Horn" and skirt Blue canyon at dizzy heights with perfect safety. He conquered the rugged ridges and the winter snow avalanches with sixteen or seventeen tunnels, and about thirty or forty miles of snowshed. Chief Engineer Judah died March 11, 1863, just after the first ground had been turned for the construction of the Central Pacific railroad. The work of construction began January 1, 1863, so that Mr. Judah had little more than two months' superintendence of the actual work. He had, however, surveyed the line some distance east, in which work Mr. Montague had assisted. After his death Mr. Montague had full charge of the work, although he was not regularly elected Chief Engineer until March 31, 1868. He had the peculiarity of not being wedded to theories or traditions, but struck out boldly, and carried out many things which to older engineers seemed impossible. Messrs. Stanford and Crocker, the managers, would often state that they would like the road to run to such and such a place, and through a given country. Although the authorities would say that this could not be done, and notwithstanding that older men would resign rather than oppose such authorities, Mr. Montague would at once set about the work of discovering how the work could be performed, and usually succeeded in carrying out the directors' wishes.

State Fair Notes.

Thomas Henning and brother, of No. 511 N street, Sacramento, exhibited a very handsome and seemingly well constructed device for manufacturing gas from naphtha. It was one of the finest mechanical attractions of the fair, if not the most important. From a tank outside of the building naphtha is forced in small particles into the machine and instantaneously converted into gas, and held in a small receiver. When the gas is nearly all consumed, the operation is repeated automatically. In this manne the supply is constant, with only a limited quantity of gas on hand at auy one time. It seems a safe, simple, and very ingenious invention. It occupied less space than au ordinary cooking stove; has a capacity of 40 burners and is claimed to furnish gas at one dollar per 1000 cubic ft, or less. In large country houses, halls, mines, etc., it would seem to be very desirable.

The Judson Manufacturing Co.'s Victor mowing machine, in the display of A. Hielbron & Brother, agricultural hardware dealers of Sacramento, as a superior and popular California manufacture. It was evidently highly appreciated, as well as other articles shown by Messrs. H.

One of the most strikingly novel California inventions shown was Clarence Sanborn's differential chain pulley which seems to be a decided improvement on all former constructions of hoisting pulleys. It is composed of less parts, is very strong, easily operated, simple and cheap in construction. The inventor is a Sacramentan who made the discovery in the endeavor to provide for his own use a cheaper article than any in the market. The invention is likely to meet with marked success.

A. Meister, of Sacramento, displayed a fine variety of buggies, phaetons, and other home-made vehicles. His exhibits from year to year show progress in inventive skill and industry.—*Rural Press.*

That Case.

EDITORS PRESS:—He that can cause his fellow man to laugh in this "vale of tears" is certainly a benefactor of his race, second only to the one who makes two blades of grass to grow where only one grew before. Having succeeded in "amusing" your correspondent, Mr. Cooper, I rejoice in the conviction that I have not lived in vain. I should almost be tempted to set up as a comic writer but that I should fear the competitiou of your correspondent.

Let Mr. Cooper but persevere and he will certainly "astonish the world;" he will paralyze the world if he can become a millionaire through the means of being a scientist.

Many of your readers, myself among them, will sympathize with Mr. Cooper in the matter of the *toddy*. It is greatly to be deplored that those bungling harvesters should spill so much good wheat, but granting the truth which your correspondent seems desirous of enforcing, that we (precious) metallurgists do our work quite as well on the whole as the farmers, mechanics, and artisans do theirs, I still fail to see any reason why we should not try to improve. In answer to Mr. Cooper's question, I will say that if he will work his lead ore in an amalgamating pan with quicksilver, a little sulphate of iron and some salt, also, of course, hot water, I have little doubt of the possibility of recovering at least 80 per cent of even so little as 3 or 4 pennyweights of lead (profit aside). It may be neeessary to roast the ore first. I advise him to make this experiment.

I don't quite understand the drift of the last question. Perfection in the application of a method would scarcely be a warrant for throwing that method aside, but in reply to what I take to be his meaning, I will quote the sailor's maxim, "Never let go of one hold until you have secured another." C. H. A.

GEOLOGICAL SURVEYS.—The Powell United States Geological Survey report has been made for the fiscal year. An area of 70 square miles has been surveyed in the southern Atlantic regions, and good progress was made in the Rocky Mountain district, by surveys in the Platte region, Utah, Arizona, and New Mexico. In the Pacific district, the work outlined includes a survey of the Cascade Mountains in Oregon, Northern California, and Washington Territory. In California, about 2,000 square miles of country have been surveyed. The work was one of great difficulty. Researches in mining districts of Colorado have been made by S. F. Emmons, and promise to throw light on the theory of veins and the relation of eruptive rocks with which they are associated. In the Gunnison district, valuable beds both of anthracite and bituminous coal, unsurpassed in Colorado, have been found, and promise to make that locality one of the most important in the State. The ore bodies of this district also appear to be of much importance. The results of the investigation of minerals collected in Colorado have proven to be of great value to geology, so much so as to have elicited the commendation of investigators both in this country and Europe. The reconnoissance of the California quicksilver districts has been begun, and the work is being energetically prosecuted.

EVERYBODY is using, and everybody is recommending to everybody's friends, Brown's Iron Bitters as a reliable iron medicine, a true tonic.

NASH GRAIN CLEANER.—Mr. Nash, who has constantly continued to manufacture his original and popular farm machine, at No. 906 K street, Sacramento, was too well crowded with orders to exhibit at the late State Fair. He has lately filled liberal demands from Arizona and New Mexico. For the latter place he ships them in "knock-down" packages, suitable for transporting into the interior on muleback.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this coast now for so many years, the firm name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this coast. They are the best posted firm on what has been done in all branches of industry and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That is this understood and appreciated is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year

THE C. P. R. R. carried East the first eight months of this year—through freight—219,300 pounds of powder.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

INFORMATION is wanted at this office of one Joseph Craig, formerly of Cass county, Illinois, who came to California in 1849.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

Smelting Lead and Copper Ores.

The following letter will be read with interest by all in any way connected with the reduction of smelting ores. Mr. Center is widely known throughout the West as one of the most accomplished, practical and scientific metallurgists in the country and is regarded as high authority in all matters relating to the reduction of either copper, lead or galena ores according to the most approved methods of modern practice:

SAN FRANCISCO, August 25, 1883

Messrs. Rankin, Brayton & Co. — Gentlemen: In reply to your request for a statement as to the practical working of such of your copper and lead Water Jacket furnaces as have come under my observation, would say that in the course of a long and varied experience in the reduction of smelting ores, covering a period of some 15 years, I have had to do with a large number of your furnaces and have watched with much interest the results of your various experiments and improvements in this direction, during the time mentioned.

Your Water Jacket smelters, as now constructed for both argentiferous lead and copper ores embrace many new features of great utility, and, in my judgment, the most valuable principles of arrangement and construction that have ever been applied to this process. I have run them under a variety of conditions, involving in many instances the most severe tests that such work is ever subjected to, with invariably satisfactory results, proving beyond question their perfect adaptation to all the wants of this great interest. Your system of water circulation is one of so much importance as affecting the wear and service of the jacket, that no one at all familiar with its operation, would on any account dispense with it. Considered from a practical standpoint, the important thing in a smelting furnace is its capacity for continuous work under all ordinary conditions. That you have accomplished this great desideratum the construction of your smelters is a fact that admits of no question. A furnace that has to be blown out every few weeks for repairs is one that no company can afford to run. Every day's suspension from work represents a large loss in running expenses, as well as loss of product, involving with cost of repairs, charges so serious as to bring disaster to any mining company. It is a well-known fact that badly designed and imperfectly constructed machinery has hopelessly involved many of the most promising enterprises in the country. Several other features of your furnaces are also worthy of special consideration, which, in combination with those already noted, make them unquestionably the most economical and successful appliances for reducing smelting ores now in use in any part of the world. Yours truly,

GEORGE L. CENTER.

IRON in a colorless state and Peruvian bark, combined with well known aromatics, make Brown's Iron Bitters the best medicine known.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.
M. H. JOSEPH—Eureka, Nev.
I. M. LEIBY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county.
H. W. FOLSOM—Los Angeles county.
C. E. CURTIS—Kern and Inyo counties.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

STRONG FACTS!

A great many people are asking what particular troubles BROWN'S IRON BITTERS is good for.

It will cure Heart Disease, Paralysis, Dropsy, Kidney Disease, Consumption, Dyspepsia, Rheumatism, Neuralgia, and all similar diseases.

Its wonderful curative power is simply because it purifies and enriches the blood, thus beginning at the foundation, and by building up the system, drives out all disease.

A Lady Cured of Rheumatism.

Baltimore, Md., May 7, 1880.
My health was much shattered by Rheumatism when I commenced taking Brown's Iron Bitters, and I scarcely had strength enough to attend to my daily household duties. I am now using the third bottle and I am regaining strength daily, and I cheerfully recommend it to all.
I cannot say too much in praise of it. MRS. MARY E. BRASHEAR, 173 Presidio st.

Kidney Disease Cured.

Christiansburg, Va., 1881.
Suffering from kidney disease, from which I could get no relief, I tried Brown's Iron Bitters, which cured me completely. A child of mine, recovering from scarlet fever, had no appetite and did not seem to be able to eat at all. I gave him Iron Bitters with the happiest results.
J. KYLE MONTAGUE.

Heart Disease.

Vine St., Harrisburg, Pa.
Dec. 2, 1881.
After trying different physicians and many remedies for palpitation of the heart without receiving any benefit, I was advised to try Brown's Iron Bitters. I have used two bottles and never found anything that gave me so much relief.
MRS. JENNIE HESS.

For the peculiar troubles to which ladies are subject, BROWN'S IRON BITTERS is invaluable. Try it.

Be sure and get the Genuine.

Scientific, Mining and Other Valuable Books.

PUBLISHED OR ISSUED, WHOLESALE AND RETAIL, BY DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

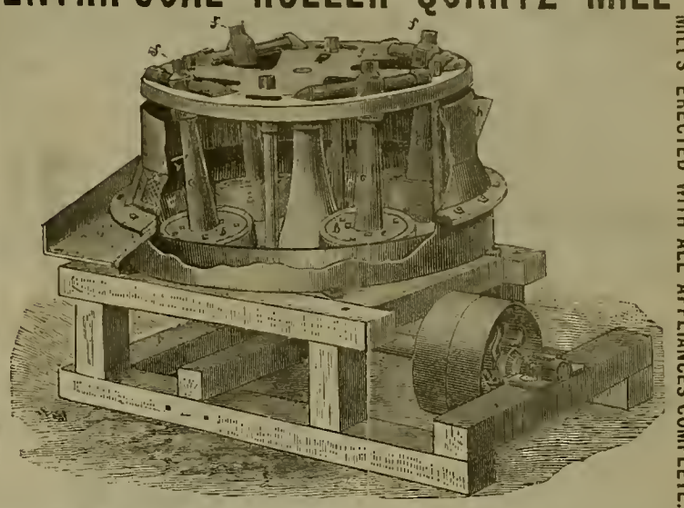
MINING ENGINEER AND METALLURGIST.

CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, $3, coin, postage free.



PRINTERS, AUTHORS, INVENTORS, PATENTEES, BUILDERS, MANUFACTURERS, MACHINISTS, MERCHANTS, and other trades-people can have satisfactory Engravings and Electrotypes made at moderate prices by the S. F. ENGRAVING CO., No. 405 KEARNY ST. Send photographs, sketches, drawings, models or samples for estimates. Map and Woodcut Engravings enlarged or reduced by the aid of photography, at less than one-half the cost of the originals and in a short time. Photo-relief, Zincograph and other improved methods employed.

F. A. HUNTINGTON,

No. 45 Fremont Street, San Francisco, Cal.

CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of those mills on the Whiddon mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continually crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.

PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

DEWEY & CO.'S

Scientific Press

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

A. T. DEWEY. W. R. RWER. GEO. H. STRONG.

Carson and Colorado Railroad.

(NARROW-GAUGE.)

The Company announce the completion of its line March 1, 1882, to CANDELARIA, Columbus Mining District, Esmeralda Co., Nev., 188 miles from Mound House (Junction with Virginia and Truckee Railroad).

STAGE CONNECTIONS,

At Hawthorne with U. S. Stage Company's daily coaches for Aurora (26 m.); Bodie (37 m.); Lundy and Bridgeport.

At Luning (125 miles from Mound House) with Gilmer, Salisbury & Co.'s tri-weekly stages (leaving Tuesday, Thursday and Saturday mornings) for Grantsville, Belmont and Tybo.

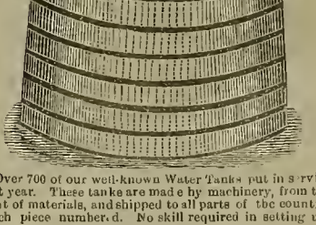
At Belleville (150 miles from Mound House) with Belleville and Independence Stage Co.'s stages for Benton (40 m.), Bishop Creek, Big Pine and Independence.

At Candelaria, with U. S. Stage Co.'s stages for Columbus (8 m.), Silver Peak, Montezuma, Alida Valley, Gold Mountain, etc.

THROUGH TICKETS

To the above points for sale at San Francisco, Sacramento, Reno, Carson and Virginia R. R. Ticket offices.

This is the direct and natural route for Passengers and Freight, to points in Southern Nevada, Mono and Inyo counties, California. The line, laid with steel rails and redwood ties and equipped with new and first-class rolling stock, is penetrating new and most promising Mining Districts which are now attracting deserved attention throughout the country.



For information on through freight rates apply to

H. M. YERINGTON, Gen'l Supt. D. A. BENDER, Gen'l Freight & Pass. Agt., Carson, Nev.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

WATER TANKS.

Over 700 of our well-known Water Tanks put in service last year. These tanks are made by machinery, from the best of materials, and shipped to all parts of the country. Each piece numbered. No skill required in setting up.

WELLS, RUSSELL & CO.,

MECHANICS' MILLS.

Cor. Mission & Fremont Sts., San Francisco.

SAN FRANCISCO SHOPPING

Of every description done at lowest San Francisco prices WITHOUT ADDITIONAL CHARGE to purchaser, by

IDA M. LYNCH, MRS. D. L. WHIPPLE, } Managers

THE PACIFIC COAST PURCHASING AGENCY,
Room 45, Phelan Building,
806 Market St., San Francisco.

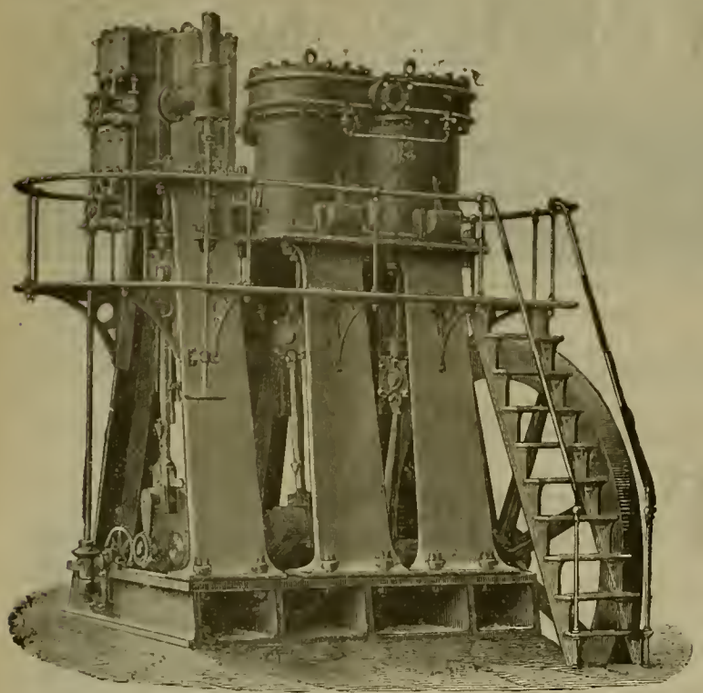
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.



WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

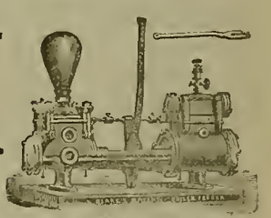
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

PACIFIC MACHINERY DEPOT.



It is Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

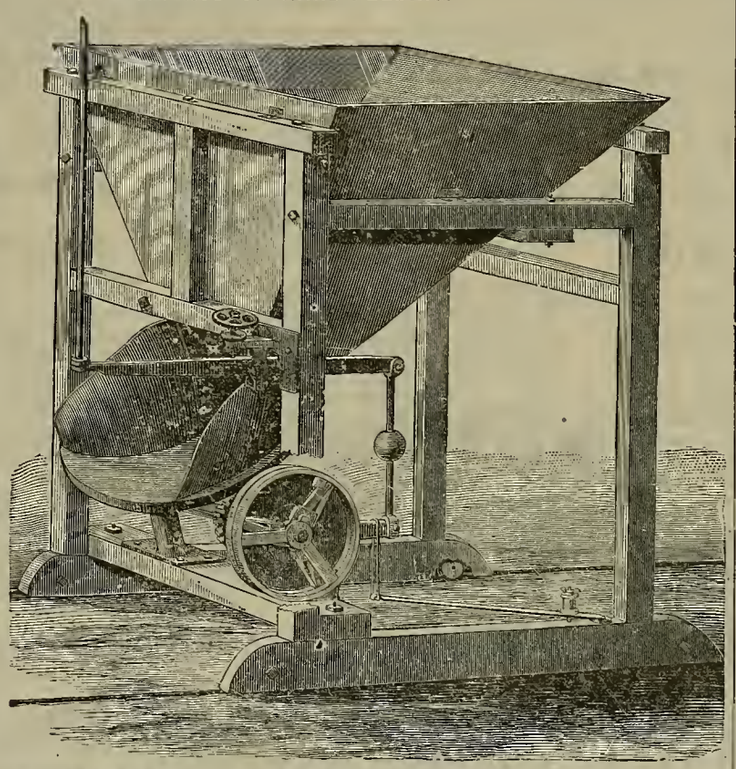
"Challenge" Ore Feeders.



OVER 1100 HAVE BEEN IN SUCCESSFUL OPERATION.

Awarded First Premiums at the Preceding and last Industrial Fairs of the Mechanics' Institute of San Francisco.

TWENTY PER CENT. MORE ORE CRUSHED WITH FIFTEEN PER CENT. LESS WEAR OF IRON THAN BY THE OLD METHOD OF HAND-FEEDING.

The opposite cut illustrates the recently-introduced Grip and Spring Attachment, which replaces the Weight originally used and results in an obvious improvement.

The practical operation of the large number of these machines now in use demonstrates the fact that the principle upon which a perfect Ore Feeder *must* be constructed is that of a *carrier* and not that of a shaking table. Uniform feeding is no possible upon the latter plan. The ore must be *evenly carried* upon a steadily-advancing plane or table to the line or point of discharge, and there be simply dropped. Jerky or spasmodically acting contrivances will not answer the purpose for feeding wet or sticky ores, nor for the ores of mines where they may change from sharp quartz to an intermixed material of quartz and earthy matter.

These Feeders are in Successful Practical Operation in the Following Quartz Mills, and are giving Perfect Satisfaction to their Managers.

The Shelf Dry-Kiln.

The following paper was read by C. A. Stetefeldt, the inventor of the well known furnace, before the American Institute of Mining Engineers. The shelf dry kiln described has been patented by Mr. Stedefeldt:

In the dry-crushing of ores, either by stamps, rolls, or other machinery, it is essential that the material should be free from moisture. Hence a contrivance which effects this with economy, and is of durable and compact construction, is a great desideratum. It is claimed for the below-described shelf dry-kiln, that it possesses these qualifications in a high degree.

The construction of a shelf dry-kiln is based on the Hasenclever principle. That is to say, a number of inclined shelves are arranged zig-zag above each other in a vertical shaft, having openings or slits where they meet, on which the ore rests in a stratum, the thickness of which is governed by the width of the slits and the inclination of the shelves. If a portion of the charge is removed at the end of the bottom shelf, a sliding motion of the ore takes place on all shelves above, and the top shelf is replenished from a hopper set over it. It will be seen that the shaft is divided by the shelves into a number of triangular prismatic spaces. Through these the hot gases from a fireplace are made to circulate, each space communicating with the next one by a flue arranged in the side wall of the shaft. These flues being located on alternate sides of the shaft, a continuous passage is formed through the whole structure.

After thus stating the principle of the construction, its details will be easily understood by reference to the drawings, Fig. 1 to Fig. 5. The drawings, Fig. 1 to Fig. 4, represent two kilns united into one structure. The cast iron shelves (*a*) are 2 feet 4 inches wide and 5 feet long, with sides and a back 4 inches high, and are cast a full half inch thick. How they rest on the brackets (*d*), and interlock each other, is shown in Fig. 5. Three such shelves, with an inclination of 38 deg., are placed in one row in a brick shaft 7 feet and ½ inch wide and 4 feet deep. The ore hoppers (*g*) rest on the iron beams (*f*). At the end of the bottom shelves are the discharge doors (*b*), with chutes projecting beyond the front wall. A swinging apron (*c*) keeps the ore in place. By dropping it a car below the chute is filled with dry ore. A number of extra large pieces of ore may cause a stoppage in the slits; for such an emergency the openings (*e*) are provided, through which a poker can be inserted. The fireplace, with air channels (*h*), is located near the base of the kiln, but its hot gases enter below the top row of shelves, and move downward, finally escaping through the flue (*k*), which is connected with a chimney. Such an arrangement is made for very good reasons. If the fire entered below the bottom row of shelves, which are filled with dry and hot ore, a careless laborer might overheat and warp them by too heavy firing. As it is, the greatest heat strikes those shelves which are filled with cold and moist ore, and overheating can hardly occur. With a downward draught the temperature of the kiln is very uniform, and the evaporated moisture can not condense again by coming in contact with cold and wet ore. The opening (*i*) in the front wall is closed either by a brick wall or a sheet-iron door. The height of the kiln from the discharge floor to the top of the hoppers (*g*) is 21 feet, more or less, depending somewhat on the height of the car to be used for transporting the dry ore to the crushing machinery. The brickwork is heavily anchored with beams, rails, bolts and buck-straps, which are not shown in the drawings.

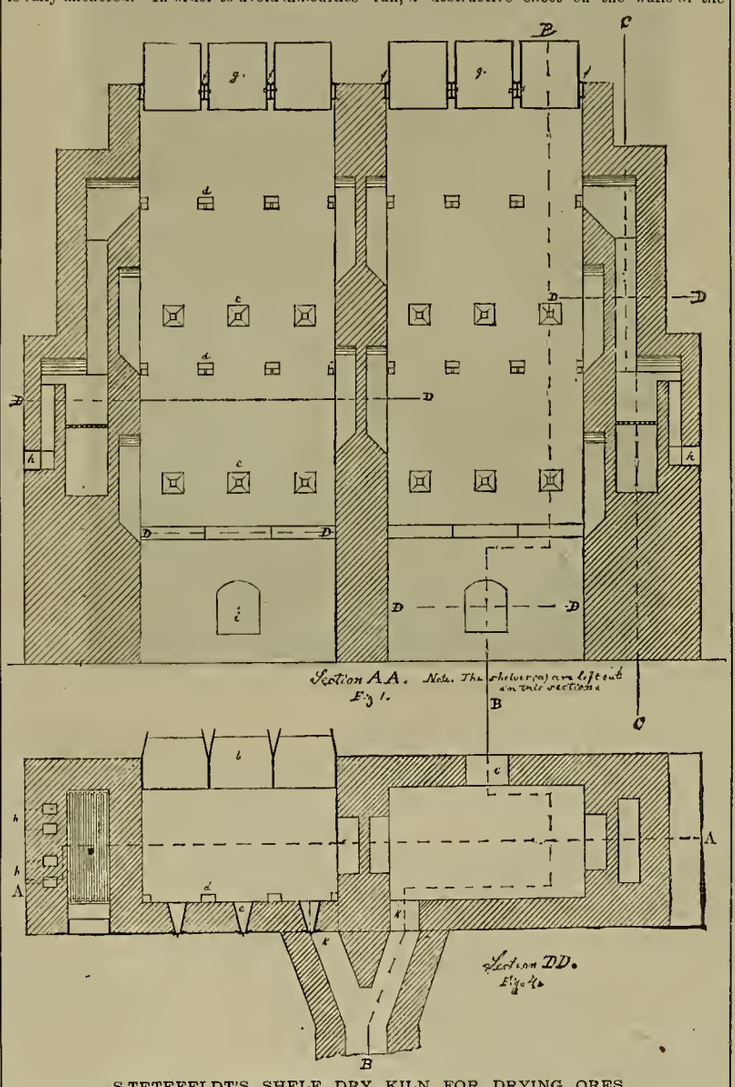
In constructing the kiln none of the shelves are put in position until the shaft is finished to the level of the beams (*f*), and the brickwork is fully anchored. In order to avoid difficulties in placing the shelves, it is best first to fit them, set after set, into an exact wooden model of the shaft (2 feet 4 inches wide), which is put up on the fireman's floor, not in a vertical, but in a horizontal position.

Since a good draught is essential for drying the ore quickly, the chimney should rise not less than 30 feet above the top of the kiln. For one double kiln a draught area of 3 square feet is required.

In case the kiln is used for drying salt, some remarks about its operation may not be out of place. The wet salt, on the top row of shelves, first bakes into a solid cake. By increasing the fire decrepitation of the salt-crystals commences, and the whole mass is shaken loose, with exception of a crust on the top. This is broken up by means of a light poker with chisel end. If the fire is kept right no rebaking of the salt takes place on the second row of shelves, but violent decrepitation continues here and lower down. The constant impact of the decrepitating salt-crystals has, in the long run, a destructive effect on the walls of the kiln if they are built of ordinary soft brick. Hence it is necessary to line the salt kiln with very hard-burnt common brick, or with fire brick. The drying of the salt is very perfect. Two double kilns for ore and one single kiln for salt have been in operation at the Lexington mill, Butte City, Montana Territory, since September 1, 1882. Mr. A. Wartenweiler, a member of the Institute, gives the following statistics as to the capacity and consumption of fuel and labor of this plant. The two double kilns put through 54 tons of ore, with about 4 per cent of moisture, and consume 2 cords of wood in twenty-four hours. In calculating the consumption of wood for several months it is found that .039 cords of wood are used for drying 1 ton of ore. One single kiln puts through 8 tons of salt (dry weight), with about 6 per cent of moisture, and consumes 1 cord of wood in twenty-four hours. In calculating the consumption of wood as above, it is found that .11 cords of wood are used for drying 1 ton of salt. The capacity of the salt kiln is somewhat overtaxed, and a heavy fire has to be kept. In consequence, the upper shelves, next to the fire, warp after some time.

One man in each shift attends to the fireplaces and the salt kiln, and one man in each shift discharges the dry ore and salt, and transports it to the self-feeders of the batteries. All shifts in the mill are eight-hour shifts.

The weight of the iron plant for one double kiln, consisting of castings, wrought-iron work, beams, rails, buck-straps and bolts, is about 25,000 pounds. The quantity of brick required is 30,000. It may be stated that every thing is constructed with a view to durability.



Compared with the revolving or cylindrical dry-kiln, the following advantages are claimed for the shelf dry-kiln:

1st. Greater compactness of construction, and greater durability.

2d. Greater economy in fuel, since very little heat is lost by radiation, and the heat is better utilized by traveling through a much longer space.

3d. No power is required in its operation.

4th. It produces no dust; hence no necessity of erecting dust-chambers, and no loss in precious metals from this source. (See illustrations on page 217.)

STETEFELDT'S SHELF DRY KILN FOR DRYING ORES.

Mill Sites.

The United States Mining laws provide that where non-mineral land not contiguous to a lode is used or occupied by the proprietor of the lode, it may be embraced in the application for the patent of the lode. The owner of a quartz mill or reduction works not owning a mine, can also patent a mill site. The rulings of the Land Office require that in making a survey in a case of this kind the course and distance from the corner of the mill site to the corner of the lode claim must be given in the field notes and plat, and a copy of the notice and plat must be posted on the mill site, and at the lode, also, for 60 days.

In case the owner of a quartz mill or reduction works is not the owner or claimant of a vein or lode, the law permits him to make application therefor in the same manner as that prescribed for mining claims; and after due notice and proceedings, in the absence of a valid adverse filing, to enter and receive the patent for the mill site at five dollars an acre.

In every case there must be a satisfactory proof that the land claimed as a mill site is not mineral in character, which proof may, when the matter is unquestioned, consist of the sworn statement of the claimant, supported by that of one or more disinterested persons, capable, from acquaintance with the land, to testify understandingly. The law expressly limits mill-site locations to five acres.

In Germany the effort to induce emigration to California has to be made in the face of government opposition. No pamphlets are allowed to be circulated, and a short time ago 20,000 books issued by the Central Pacific Railroad's agent were seized and destroyed.

CORRESPONDENCE.

Steel and Cast Steel.

EDITORS PRESS: — The difference between steel and cast steel, and the methods of making these metals, is a subject upon which there is much confusion of ideas in the popular mind, and even much ignorance displayed by dealers and workers of steel when called upon to define and explain it, and describe the various processes of manufacturing.

But steel may be defined as iron with a small amount of carbon; and common rail steel may differ but a little from iron. This class of steel is termed "low grade," "decarbonized" or "crude" steel, and the Bessemer steel furnishes a fair sample. It is well adapted for much mechanical work, including building material, shaftings and railroad rails. In ten years this class of steel has almost superseded iron for railroad rails; for in 1881 there were 3,485,000 tons of steel rails made against 700,000 tons of iron rails. At this rate of increase, in ten years more the iron rail will be but a memory. The methods, or processes, of making this crude, or low grade steel, are numerous, but as all bring about the same result, and differ only in details of manipulation and employment of means used, a description of the Bessemer process which serves as a general type and description of them all. Ore suitable to make iron, of a quality thought worthy to be converted into Bessemer steel, must be comparatively free from sulphur or phosphorus, and while common iron ore is quoted in Cincinnati, Ohio, at $4 per ton, "Bessemer ore" is quoted at $10.50 per ton. This selected ore is so mixed as to produce the best results and assist the "conversion," and is then smelted into iron by the ordinary furnaces; the molten iron is then run into a large pear-shaped vessel called a "converter," which is suspended on hollow trunnions, through which a blast of air is driven under heavy pressure for about twenty minutes. This blast of air rushing through the liquid metal burns out a portion of the sulphur and phosphorus as well as about ten per cent of its carbon. To replace this carbon "white iron," or speigeleisen is added. When the color of the flame, which rushes from the top of the "converter," shows that conversion is completed, the blast of air is shut off, and the "converter" is turned on its trunnions and its contents poured into iron molds and made into ingots to be reheated and hammered or rolled into bars, plates, railroad rails, etc.

Cast steel differs from this "crude," or "Bessemer" steel, in the materials used, in its manufacture, the methods employed, and the results reached. In fact, cast steel is the great cutting material, and instead of being made like the Bessemer from pig, or cast iron, it is made from the best quality of wrought iron, excepting the steel made from black sand, by the Russell process. The result is so different from the crude steel, that cast steel is used wherever lightness, elasticity and great strength is required, or a hard, fine, or cutting edge is wanted.

For the production of cast steel (with the exception of black sand) the material used is the best wrought, or Swedish iron; by far the largest amount is made from the "Danemore" iron. The ore from which this iron is made is magnetic, and remarkably free from sulphur, phosphorus, arsenic, manganese or other deleterious substances. It is smelted into pig or cast iron, and remelted, and run into ingots, reheated and rolled, usually for convenience sake into bars three inches wide, and five-eighths of an inch thick. These bars are next packed with charcoal in air tight chambers in a furnace, in such a way that no two bars touch, and a fire is kept up from nine to fourteen days, or until the tests made at certain intervals show that cementation has taken place, and the molecular structure of the metal has undergone a complete change. The bars are next removed, and as they are covered with blisters, the metal is now designated as "blister steel." These bars are now broken into small pieces, and put into black lead crucibles, and submitted to a great heat for about two and a half hours and melted. This liquid steel is now run into molds, or made into ingots of about fifty pounds weight, unless larger ingots or castings are required; if so, they are made from the resultant product of many crucibles. Herr Krupp sometimes uses the resultant of two thousand crucibles to cast one big gun.

The small ingots are sold in the market or sent to the steam hammer, or rolls, to put into merchantable shapes, in like manner as the Bessemer steel.

There is another process of making cast steel called the "Russell" process, which has been recently invented by Dr. E. F. Russell, of San Francisco, which is unique, and is the crowning discovery of the generation in the manufacture of high grade steel, as the steel is made direct from the ore at one heat.

A detailed description of this method, or process will be interesting, as it is especially adapted for utilizing the black magnetic iron sand that abounds in inexhaustible quantities, not only upon our present coast line, but along the old ocean beaches of past ages, which are now situated in many places far inland.

All the black sand deposits upon this coast contain gold, and in working it, an important rebate is furnished; for after the iron ore is separated from the lighter sand, the gold is easily extracted, and is found to vary in value from a few cent to a number of dollars per ton, and will probably average at least one dollar per ton above the expense of extracting it.

The mining of this ore consists in simply shoveling the sand into and running it through a "magnetic separator" which may have a capacity of 200 tons per day. The sand yields from fifty to ninety per cent of iron ore, and some of these machines will save within one or two per cent of all the magnetic ore it contains.

The ore is pure oxide and suboxide of iron, and contains no sulphur, phosphorus, arsenic or manganese. Assays of this ore give 72.4 per cent of metal, and daily smeltings by the Russell process have averaged 66⅔ per cent of steel from the gross weight of the ore. To work this fine ore successfully in a blast furnace, it is agglomerated with the fluxes, and made into small masses or "bricks," and these are cast into the furnace (as coarse ore or ingots of pig-iron) and smelted, and the first result is cast-steel of a high grade. This is run in molds, and when annealed, is passed to the steam-hammer or rolls, and adapted to the wants of the market.

To make crucible steel, the ore is simply mixed with the fluxes, in proportion of about four of ore to one of flux, and poured in crucibles of black lead and smelted. The result is steel; and ample tests prove it to be the equal of the best brand of steel made from the best brand of Swedish iron.

The practical work already done proves that this steel can be made as cheaply as wrought-iron, and it is capable of being made almost as soft as copper, and of taking temper until it rivals the hardness of diamonds, and takes a polish until it can be used as a mirror and looks like burnished silver. It cannot be presumptuous to prophesy that the Russell process will soon revolutionize the manufacture of high-grade cast steel, as the Bessemer has the manufacture of rails.

Bessemer has done much to advance civilization, by introducing cheap steel; and soon the world will give Russell a place beside him, and acknowledge him as another grand apostle of the Steel Age, or the age of advanced civilization.

E. T. BARBER.

Gunnison County (Colorado) Mines.

EDITORS PRESS: — Assuming that you are always willing to place reliable mining information of a general character before your readers, I write you after a ten day's trip to the mining towns in Gunnison county, Colorado. The first two days of my trip were spent at Crested Butte, a town of 1,300 inhabitants, situated in a valley thirty miles northwest of Gunnison town, and connected with it by a branch of the Denver & Rio Grande railway. The mining here consists in the development of both bituminous and anthracite coal, the Colorado Coal and Iron Co., of Denver, having very extensive bituminous coal beds and fifty coke beds, employing fifty men, under the superintendency of J. K. Robinson. At present this is by far the largest interest in the town, and the one upon which it is to a great extent depending. From one to five miles north of the town there are two anthracite coal mines that are now assuming sufficient proportions to give them considerable notoriety. The Mesa Mining Co., of which Mr. Howard F. Smith, of Crested Butte, is the manager, have expended a large sum of money in acquiring and developing coal lands, and in the erection of a coal breaker. Mr. Rush Warner, of Gunnison, the Manager of the coal company, is pushing the work of development gradually. The anthracite coal now being sold by these companies is considered equal to any in the market. From Crested Butte westerly about eight miles, is the

Mining Town of Irwin.

Of about eight hundred inhabitants. This is the seat of the Forest Queen mine which deservedly ranks among the first class mines of the county. The company which now control this mine are putting up large hoisting works, with the view to work the mine upon a much larger scale than heretofore. The Thompson Brothers, from whom the present company bought a controlling interest, are still connected with it, and immediately interested in the management. There are in and about Irwin, within a radius of three miles, several very promising mines in different stages of development; among which are the Durango, Bullion King, Ruby Chief, The Oaks, Old Sheik, Howard Extension, Hopewell and others, upon each of which from $2,000 to $30,000 have been expended, and with very satisfactory results. The ore in this camp is of a high grade, assaying from $50 to $2,000 in silver. The Rose Reed & Co.'s concentrating works are established here, and doing a steady and paying business; and McVictor Wilder is erecting concentrating works with a capacity of twenty tons daily. This, when completed and running, as it will be in a few weeks, together with the concentrators already mentioned, will greatly facilitate and encourage mining operations in Irwin,

PLAN OF FIRST STORY OF DR. CARR'S RESIDENCE See Page 214.

as the transportation charges will be materially lessened. There is an apparent dullness in the town at present, though sufficient development has already been made to convince the most skeptical that with continued development, and properly expended capital, Irwin will eventually have an output equal to any camp in the State, except Leadville. Returning to Crested Butte from Irwin, I then pushed my way through to Gothic, a mining town of considerable importance, though very dull at the present time. The most noted of

The Gothic Mines

Are the Sylvanite, which has produced large quantities of very high grade silver ores. One piece of 670 pounds was sent to Chicago for reduction, and contained sixty per cent silver. This mine is owned by Chicago and Philadelphia capitalists, and is considered and known to be one of the best properties in the county, the regret being that it is not pushed for what it is worth.

The Virginia

Owned by C. O. and T. M. Avery, of Chicago has produced large quantities of high-grade ore and its development consists of a shaft of 210 feet, and tunneling and drifts to the extent of 300 feet. The ore is gray copper and brittle silver.

The "James B. Belford," owned by Birge and Wait, is now being developed, and is producing some very fine ore of yellow and gray copper. This is looked upon as one of the most promising of the Gothic mines. In addition to those named, there are dozens of others which are gradually being developed, as the circumstances of the owners will admit of. Among them, the "Iron Duke," "Silver Nicholas," "Jenny Lind," "Jim Blaine," "Rustler," "Silver Ledge," "Midnight," and many others. The owners of the mines in this neighborhood are generally men of small means, and it often occurs that their means are expended just at a time when a little additional capital would develop, in a good many instances, good properties. In fact, at the present time, in all parts of the county, the cry of the prospector and miner is for more capital, and if I may be permitted to judge of the present condition of prospects, mines and miners, I would most unhesitatingly say that there has never been a time in this county when good mining properties could be secured at as low figures as at present. It is conceded on all hands that no one is now capable of selling "holes" in the ground at fancy figures, as was the case in the days of Leadville excitements, and that it is better to sell at low or fair prices than not to sell at all. With a desire to sell at what mines are really worth, based to some extent on commercial principles, I trust that ere long the mining interests of this county will revive.

Yours, etc., MONTAGUE.

Soda Deposits.

They are Beginning to be Looked After in Nevada.

Since it has been fully demonstrated that borax, especially the cotton-ball form, cannot be successfully worked without the use of carbonate of soda, says the Candelaria *True Fissure*, considerable attention has been given to the search for deposits of it. A large and valuable piece of ground containing a very large percentage of soda was discovered some years ago at or near the upper end of Walker lake. This is under the control of B. F. Gray, who will soon erect drying sheds and put other necessary machinery at the place of the deposit. He estimates that he has one of the best soda marshes to be found anywhere on the coast. He also contemplates the manufacture of potash, which commodity is largely in demand in San Francisco and other manufacturing towns. An experiment is now being tried by Jas. Cross to ascertain the value of soda contained in the waters of Black lake, situated about three miles west of Benton, California. The water is usually impregnated with alkali. The lake is situated in a basin formed by the surrounding hills, being fed by springs on the hillsides, and by several in the lake itself. The atmosphere near the water is very disagreeable in odor, and at the lower, or southern end, almost intolerable. About 200 acres of the land about the lake, which is one and one-quarter miles long by an average width of about a third of a mile, has been surveyed and located for soda. A number of pits are being dug near the edge of the water, into which some of the alkaline fluid will be run, and then allowed to evaporate. This will give a fair but crude test of the amount of soda in the water. If the experiment proves good, a ditch will be dug and a concrete pipe laid to the railroad station, a distance of five or six miles, through which the water will be conveyed, and the evaporation will then be done near the shipping point, thereby saving hauling. One curious feature of the water is that in several places it is of a color almost as red as blood. This may be due to some mineral, but it is more generally thought the presence of animiculæ causes the discoloration. Within a short time enough will be known of the value of the discovery, and if it proves successful, there is a lot of money in it for the holder.

The Ragtown Soda Lake.

If soda is now an object, as explained above, the soda lake near Ragtown should come to the front. There pure crystallized soda may be cut in great squares, looking for all the world like rose-colored ice. Some years ago sheets of this soda three feet square, three or four inches thick and showing beautiful crystals on one side were brought to this city. The parties who then claimed the lake and surrounding deposits asserted that they had an inexhaustible supply. By digging down through a foot or two of gray mud they came upon a solid bed of of soda unknown depth. When saturated with water, as it is when first dug up, this soda presents the appearance of ice. The finding of soda in this shape by the pioneers who crossed the plains in the early days of the California gold excitement gave rise to the story—firmly believed for many years among the miners—that in places on the deserts there was everlasting ice under the alkali sands. The theory was that the white sand and chalky alkali dust reflected all the heat of the sun and preserved the ice beneath year in and year out.

As the Ragtown deposit is at no great distance from the Carson and Colorado Railroad, over which it can be cheaply shipped, it may now be well worth looking after. There is nothing to do but quarry out blocks of the pure soda and pile them up on edge till they drain out and dry off. They are then ready to ship.—*Virginia Enterprise.*

A FAST BOAT.—the celebrated Hudson river steamer, *Mary Powell*, regularly makes twenty-two miles an hour on an ebb tide. She is by far the fastest boat on the Hudson, and can slide right away from Gould's $250,000 steam yacht, *Atlanta.*

A STATE Court of Louisiana has ordered the mail matter intended for the Louisiana Lottery Company and addressed to the New Orleans National Bank, to be delivered to the Bank. The case will be removed to a Federal Court.

By the aid of the American idea of using refrigerator cars, Londoners now enjoy fresh herring from Scotland.

MECHANICAL PROGRESS.

Increased Speed of Machinery.

The precise economical speed at which machinery of various kinds may be run is a matter of great importance. Very much in this direction depends upon the degree of perfection which has been obtained in its manufacture. Much attention is being directed to this subject at the present time, and careful inquiries appear to show a gradual increase in speed within the last fifteen years. Inquiries in this direction in the Lowell Cotton Mills indicate an increase of from 25 to 30 per cent within the period mentioned. In considering the condition of various manufacturing interests this matter of higher speed and increased capacity of machinery is, says the New York *Commercial Bulletin*, often lost sight of, but is certainly worthy of attention. There are about 12,000,000 cotton spindles in the United States to-day, against 7,000,000 in 1870; but if the speed and capacity per spindle has increased even 25 per cent, the actual productive capacity of the mills has been more than doubled, and the cotton manufacturing capacity of the United States been more than doubled since 1870; and a glance at the amount of cotton actually consumed by our mills shows an almost equal increase.

In the woolen manufacturing interest very similar conditions are found to exist. A desire to diminish the cost of production has led to an increase in the speed of machinery, and an increase of the capacity of the mills in other directions. The loom which formerly ran 50 or 60 picks per minute now runs 95, perhaps; and where 40 inch cards were used, many mills now have cards 60 inches in width and of proportionately increased diameters. And yet, in speaking of the number of sets of woolen machinery in the United States, we are accustomed to compare the figures of 1883 with those of 1873 or 1863, without paying attention to any increase which has occurred in the size of the cards or capacity of the machinery during this period.

The effect of lessening cost of production by means of increased speed and machinery of enhanced capacity is good. It is in the interest of the consumers, and therefore eminently economical in its tendency.

The Bisulphide of Carbon Boom

Every two or three years some one comes out with an alleged new discovery in the way of substituting bisulphide of carbon vapor for steam as a motive power. *Cotton, Wool and Iron*, of Boston, speaks as follows of the latest claim in this direction: "It may interest our readers to know that very extensive and expensive, as well as decidedly unsuccessful, experiments were made at length, and we think some of them were made in the yard of the Corliss steam engine company, in Providence, upon this very peculiar vapor. Bisulphide of carbon is simply a combination of carbon and sulphur, and it has been used, to a certain extent, for heating and driving in the place of steam. It boils at a low temperature—something less than 120—and the general claim for it has been that its expansive force was so many times that of water, its boiling limit was so much lower than water, that if it could be controlled there was a tremendous force in it for practical utility that must ultimately and largely supplant steam power. Experience does not prove this to be all realizable. There is no doubt, perhaps, but that it may be somewhat more profitable in certain localities, and with the peculiar apparatus required, than steam power, but the question as to whether it will in any sense supplant steam where large powers or an aggregation of power, are required, is quite another matter; it is something which has never yet been done successfully. It will be best to carefully examine and wait. If it is to be profitable, then come in on the homestretch, but if you invest on the supposition that you are going to destroy steam power, follow the old man's advice about speculating in stocks, which, being condensed, is simply this: Make out a check for the largest amount of money you can lose, go and give it to some stock broker and tell him, under pain of death, never to come near you or speak to you again. This is the cheapest way to get rid of your money."

An Improved Wood Pulp Machine.

A Gardiner, Maine, man has invented a machine for preparing wood fiber for paper pulp, which is described as follows: The purpose of the machine is to shave the wood off so finely that it is ready to go into the paper engine. It takes a piece of log, 12 inches in length, which is revolved at a speed of 1,000 revolutions per minute. A sharp cutter shaves off a shaving so thin that it would take 750 of them to make an inch. As it takes 200 sheets of ordinary paper to make an inch, one can judge somewhat of the thickness of fiber made by this machine. The knife has a sliding motion, and gradually moves forward as the block decreases in diameter. In the first machine made, the principal trouble was found in keeping the knife sharp. As the knife became dull, the fiber turned off became of uneven thickness, but this has been remedied by an ingenious arrangement of whetstones that keep constantly at work on the knife while the machine is at work. The pulp the machine makes has not been tried on the better class of paper, but it will work on the coarser grades, and the inventor is confident it will result in a great change in the manufacture of pulp. It makes it much faster, besides saving labor, and the saving in cost of transportation, the pulp being dry and therefore with no water to pay freight on, will be a good profit.

Economy of Steam.

A correspondent of the *Scientific American* calls attention to a source of the loss of steam to which very little attention has heretofore been paid. His suggestions, which are appended, are well worthy of consideration:

Whenever and wherever a steam engine is at work, it must be kept at its full working head of steam nearly up to the very close of its service. Just before a steamer reaches her wharf, or before the six o'clock bell is about to ring for the shutting down of mill or factory work, if the engineer has a surplus of power, he can afford to bank his fires, and economize a trifle by working down a few pounds of his extra steam. But it is only a very little, for he must of course retain enough to drive the engine at its working gait fully up to the last minute. And when the bell rings and he shuts off steam for the end of the trip or the close of the day's work, his gauge shows a pressure but a few pounds below that at which he regularly runs. His boiler therefore is now a reservoir of power which is practically to be wasted. He either "blows off steam," or he does not, according to circumstances, but in either event the greater proportion of that power is lost for service. The dissipation of heat which necessarily takes place before the hour comes for starting again measures precisely the amount of energy wasted, for the vapor of water owes its efficacy only to the heat of recent importation. Without the heat its elasticity is gone. Can we not possibly substitute for it a gas whose elasticity does not depend on recent heat, but is a permanent quality at all temperatures, notwithstanding the fact that an increase of temperature gives an augmented elastic force?

Compressed air furnishes us exactly what we need to answer our purpose. Were the force of the steam used mediately, through an air tank, and not directly, it would be an extremely simple matter to utilize the heat remaining in the boiler, furnaces, etc., so that scarcely any portion of it should be wasted. One turn of a switch would connect the steam power at once with pumps which would go on for ciugair into the air tank so long as any power remained. No attention would be needed. When the power was expended the engine would stop moving, and all would remain quiet till required for use. The air thus condensed would be a given amount of active energy ready for application on eall, and the efficient service of the engine for the next day would have just that amount furnished to its credit, with no expense added; that degree of expense would be saved. How much this would actually economize must depend on the circumstances, but it would in any case be no insignificant item. Inquiries made of steamboat engineers show that in their judgment it would be sufficient to run the boat from five miles to ten, according to her size and speed. Some go much higher than that. And with a large ocean steamer there can be scarcely a doubt that it would decidedly exceed this. Surely this is a wasted power, which is worth saving.

A NEW STYLE OF ROOFING.—We recently saw, says *Mechanics*, a slate roof, which, in its way, was a decided novelty. Each slate exposed its full face to the weather on a flat roof having a pitch of only one half inch to the foot. It was laid in cement, and had been on for five or six years. The cement was the invention of Mr. C. C. Post, of Burlington, Vt. It consists of coal tar (the liquid and not the solid article), thickened with cement, or, better still, a little ground slate, slaked lime and linseed oil. The proportions were made according to the judgment and the requirements of the material. It was heated until liquid, poured on the roof, and the slate bedded in it. The joints were then payed, and the roof was finished. The main bulk of the compound is tar and cement, or tar and ground slate. When of just the right thickness, the compound sticks with extreme tenacity to the slate, and cannot be detached without violence. The cost of such a roof is, we believe, at the present time, less than that of tin, and on account of the greater surface exposed to the weather, is considerably cheaper than slate. The compound is not patented, we believe.

ATTENTION has recently again been drawn to M. M. Neugean and Delaite's process of protecting iron surfaces against rust. A very fine powder of metallic zinc is mixed with oil and a siccative, and applied to the iron by means of an ordinary brush. In many cases one coat is sufficient. Two coats are, at any rate, guaranteed to secure a protection against the corrosive action of the atmosphere, as well as of sea water. The zinc coating gives the iron a steel gray appearance, and it does not interfere with subsequent painting. A good mixture, of which only the necessary quantity should be prepared, consists of eight parts, by weight, of zinc, seventy-one of oil, and two of a siccative. *Engineering*.

SCIENTIFIC PROGRESS.

Artificial Organic Compounds

It is but a few years ago that it was the universal belief that the synthesis of organic substances—that is, their direct production in the laboratory by the union of their elements or constituents, was an impossibility. It was believed that the substances peculiar to the animal and vegetable kingdom, many of them exceedingly complex, were elaborated in the living tissues under the agency of a peculiar force, in some respects independent of the physical and chemical forces, and which was characterized as the vital force. This view is now known to have been erroneous, and to-day an innumerable number of compounds peculiar to the animal and vegetable kingdom are produced in the laboratory of the chemist, and, in a number of remarkable cases, produced on the manufacturing scale.

The great discovery of Wohler—namely, the artificial production of urea from cyanate of ammonia, was justly looked upon at the time as being revolutionary, as it gave the death-blow to the usually received opinion that organic substances required the co-operation of a vital force for their production. And once freed from the incubus of this false assumption, a host of remarkable discoveries and investigations in this field have rewarded the labors of chemists.

In 1856, the French chemist, Berthelot, succeeded in effecting the synthesis of formic acid from inorganic materials—that is, from carbonic oxide and water, by heating with caustic potassa, and without the intervention of an organic substance derived from the living world. Close upon this came the synthesis of alcohol, directly from its elements—carbon, hydrogen and oxygen.

The result has been of vast service to the world in many ways, as a few striking examples will serve to show. About the year 1868, two German chemists, Graebe and Liebermann, succeeded in obtaining from anthraeene, one of the products of coal tar, a substance in all respects identical with alizarine, the coloring principle of the madder root. At first the discovery was looked upon as an interesting one, but of no industrial value. By the further development of their discovery, however, these investigators were enabled shortly thereafter to produce this important coloring principle in quantity on the commercial scale, at a price which enabled it to compete with the natural product. It was found not only to be in every respect capable of replacing the natural coloring principle, but to be superior to it, inasmuch as it was free from certain other related coloring matters that accompany the natural alizarine and detracted from the brightness of its colors. The result to-day of this interesting discovery, made a little over ten years ago, is the almost total extinction of the madder cultivation in Europe. Artificial alizarine made from anthraeene has taken the place of the natural product. Large areas of country devoted to the cultivation of the madder are now devoted to the raising of other crops, and the world's supply of a valuable dyestuff is obtained principally from the once worse than useless coal tar. In the course of a few years more, the inevitable result must be the total extinction of the madder cultivation.

Another example almost as striking is the artificial production of vanilline, the essential principle of the vanilla, which is now manufactured commercially on the larger scale, and threatens, by reason of its superior purity and relative cheapness, to completely drive out of the market the natural product.

The latest triumph of synthetical chemistry in this interesting field is the production of indigo by artificial means, which has lately been accomplished by Baeyer. The cost of producing this artificial coloring material is at present too high to seriously interfere with the natural dyestuff, but in a few years more, with the aid of study and experiment, the cost of its production will unquestionably be so greatly reduced that it will be placed in the market in direct competition with the natural indigo, which in time it will entirely replace.

The above are only a few of the more prominent examples of many that might be named, to show how steadily the chemist in the laboratory is encroaching upon the domain of nature. —*Manufacturer and Builder*.

The Alleged Luminosity of Magnets.

The late Baron von Reichenbach, in a remarkable work entitled the "Dynamics of Magnetism," described at great length a series of experiments with certain persons of peculiar nervous organization, which proved, as he claimed, that there is a peculiar luminous emanation arising from the poles of a magnet, resembling a faint electric discharge in rarefied air.

In the *Philosophical Magazine* for April last there is an account of a series of experiments made by a committee appointed by the Society for Physical Research, with the view of proving or disproving the existence of this alleged phenomenon. This committee has just reported through Prof. W. F. Barrett. From the report in question, it appears that neither Prof. Barrett nor any other member of the committee was able to perceive the emanation in question; but they succeeded in discovering two persons, one described as "a certain gentleman," and the other—a boy—"as an assistant in a baker's shop," both of whom appeared to be able, in a room perfectly dark to other people, to see a faint glow, like a waiving cone of light, at both poles of a strong electro-magnet, and to be able to distinguish, by the appearance and disappearance of this glow, when the current was turned on or off with the aid of a commutator in charge of a party in an adjoining room. From the account of the manner of conducting these experiments, it would appear that the committee had taken every reasonable precaution to guard against deception.

There is nothing absurd or impossible in the phenomenon alleged to have been discovered by Reichenbach; that which has always caused it to be looked upon with suspicion by scientific men, is the fact that it can only be observed by a limited number of persons whom Reichenbach calls "sensitives." It would appear to be a comparatively easy task to subject this as yet questionable phenomenon to such a rigorous examination as to place its existence or non-existence absolutely beyond further question. The experiments of Prof. Barrett's committee do not seem to have been extended enough to satisfactorily settle this question.—*Manufacturer and Builder*.

Return of the Great Comet of 1812.

The discovery of another comet, by Prof. Brooks, of the Rochester Observatory, N. Y., was recently announced. Careful observation has since shown that this is the famous comet of 1812, whose return was predicted for this year by the astronomers of 1812. The comet of that year was visible to the naked eye for the period of ten weeks. It is now again rapidly approaching both the sun and the earth, and will be visible to the naked eye in a few weeks. The comet has been observed by Mr. Hill at the Davidson Observatory, in this city. It presents a faint nebulous mass with a star-like nucleus of the eleventh magnitude. Its appearance is very faint, so much so that a star of the eleventh magnitude near by presented a comparatively dazzling appearance.

A few evenings after the discovery of this comet by Prof. Brooks, Prof. Swift, of the same observatory, and director thereof, discovered another comet in the same neighborhood. The indications are that these two comets will cross each other's orbits in their progress toward the sun. Their appearance so near together in the same field is considered as something surprising and significant. It is thought by some that they may throw new light upon the origin of comets and the laws by which they are governed. Both comets are being observed with much interest at all the American observatories.

AN alleged error in the accepted law respecting the intensity of sound as affected by distance, has lately been urged by Vierordt, who argues, as the result of many experiments, that the accepted law, that the intensity of sound "diminishes inversely as the square of the distance," should be modified to conform to the statement that "the intensity of sound in free air decreases in the simple ratio of the distances from the source of sound." According to the accepted law on this subject, when the distance from the source of a sound is doubled, the intensity should be reduced to one-fourth; when the distance is trebled, to one-ninth, etc. Herr Vierordt's observations led him to the conclusion that the intensity of sound, at double, treble, etc., the distance from the source of sound, is one-half, one-third, etc. Vierordt's experiments were made with a sound pendulum, which set in vibration a small ivory plate, and the observations were made at all times, under varying circumstances, and with different media—wood, metals, ice, water, etc. The results obtained are asserted to have been in all cases uniform. The law of "inverse squares" has long been held to be demonstrably correct as regards all radiant forces, and the experimental results of Vierordt will doubtless be found to be susceptible of some explanation which will bring them into conformity with the accepted view.

LIMITS OF GERMINATION.—Pasteur, in his investigations regarding fermentating germs and bactria, demonstrated that a temperature of 212° Fahr. was sufficient to destroy the power of germination in these minute forms of animal and vegetable life; but with the higher orders of plant and animal life, a much lower heat than 212° will destroy all vitality. According to Goppert, 39° F. is the lowest temperature at which most seeds would germinate. The following table by Sach shows the lowest, the highest, and most favorable temperature for germination of wheat, corn and barley:

	Lowest Temp.	Highest Temp.	Temperature of rapid Germination.
Wheat	41° F.	104° F.	84° F.
Corn	41°	104°	84°
Barley	48°	113°	93°

Experiments by the writer to verify the germinating point for wheat, revealed the fact that the temperature given is too low; as, in one instance, wheat that had been heated to 130° F. germinated. The grains were sprouted on cotton in the open air, and not in the laboratory by artificial heat, and the July sun and different wheat may explain this difference in results. The time required for germination varies—with wheat, rye, corn and oats three to six days being sufficient.

"CREDIT: ITS MEANING AND MOMENT," is the title of a neatly printed little pamphlet by Clark W. Bryan, proprietor of the *Paper World and the Manufacturer*. It reflects the impression of a critical observance on the subject of mercantile agencies, and will repay perusal by all who have an interest in the working and management of such institutions.

Mining Share Market.

Very little of interest is going on in the mining share market just at present. Some of the mills on the great lode have started, and when they all are, some 800 men will be put at work along the Comstock.

The connection of the north drift on the 2900 level with the winze down from the 2700 level will open ground to exploration, and prospecting will presently be active to the northward in the Sierra Nevada.

At the Union Consolidated they are cutting many small streaks of good ore in west cross-cut No. 2 on the 3000 level.

At the Mexican they will soon have completed connection between the 2700 and 2900 levels, when prospecting may be commenced in a very interesting section—a section in which some paying ore is known to exist.

At the Ophir they are now in a position to open up a large space of ground in the upper levels lying to the west of the old early-day workings. In this section there is known to be some seams of rich ore and much ore of low grade. Not only will the ground at and above the 150 level be explored, but a winze will be sunk to the depth of 200 ft below said level, and the ground at that depth also prospected.

At the Hale and Norcross, they will now soon be ready to crosscut and thoroughly explore their 2700 level.

The following companies had cash on hand Oct. 1st: Exchequer $17,867.21, Crown Point $21,170.54, Ophir $61,519.68, Mexican $21,490.67, Con. Virginia $84,693.76, Syndicate $4 977.82, Genesee Valley $3,758.77, Pedro Con. $10.55, California $857, Gould & Curry $18,778.17, Occidental $5,809.01, Utah $4,561, Northern Belle $43,771.90, Alpha Con. $6,458, Bulwer Con. $411, Standard Con. $161,509, Mono $2,729, Bodie Con. $32,323, Summit $1,406.15, Tioga $842, Double Standard $36.20, Booker Con. $403.38, Savage $11,475.48, Potosi $35,991.58, Chollar $91,604.60, Jackson $4,289.46, Justice $8,000, Andes $6,000, Navajo $2,639.97, Union $17,422.77, Alta $28,109.40, Benton $6,313.89. The following companies had an indebtedness on October 1st: Best & Belcher $7,119, Bechtel $93.04.

Bullion Shipments.

Mt. Diablo, Sept. 27th, $4,963; Standard Con., 24th, $37,381; Contention Con., 30th, $13,544; Ontario, 26th, $12,038; Vienna, 26th, $1,502; Horn Silver, 26th, $12,000; Hanauer, 27th, $4,500; Crescent, 27th, $5,880; Horn Silver, 27th, $9,000; Ontario, 27th, $4,419; Vienna, 28th, $1,555; Ontario, 28th, $6,597; Horn Silver, 28th, $6,000; Hanauer, 30th, $4,500; Nevada, 30th, $2,020; Ontario, 30th, $7,186; Vienna, 30th, $1,475; Horn Silver, 30th, $12,000; Silver Reef, (for Sept.), $35,002; Bullionville, Oct. 2d, $2,035; Horn Silver, 2d, $21,000; Ontario, 2d, $13,920. During the week ending Sept. 29th, inclusive, there were shipped from Salt Lake 57 cars bullion, 1,460,536 pounds, sent East; 39 cars ore, 820,100 pounds, sent East; 2 cars ore 48,350 pounds, sent West; and 1 car white lead, 25,000 pounds sent West; making a grand total of 99 cars, aggregating 2,353,986 pounds.

So many cattle have been sent over the California line from Nevada that the complaint is made of scarcity in the Sagebrush State.

A CARGO of wheat valued at $45,000 cleared from Wilmington for Cork Saturday.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alpine

ISABELLE G. & S. M. Co.—*Monitor-Argus*, Sept. 28: The Exchequer mill is kept running steadily on Stella ore. There are now about 75 tons of ore at the mill ready to be worked, of which the average assay value is $75 per ton.

Amador.

RICH STRIKE.—*Ledger*, Sept. 29: A rich strike is reported from the Calaveras side of the Mokelumne river. The discovery was made by some of the men employed at the Mammoth mine, and was located in behalf of the discoverers and W. A. Nevills. Some specimens of black ore, similar to that met with in the famous bonanza of the Mammoth mine, were obtained.

MAMMOTH.—The seam of free gold near the surface has not been worked to any extent, on account of bad air. When the men were compelled to quit, the seam was three inches in width. The efforts of the miners are now directed towards improving the ventilation.

ZIELE.—The Ziele mill is idle, owing to the water being shut off for the purpose of cleaning out and enlarging the branch ditch, which work was commenced Friday afternoon. It will take a week to complete.

AMADOR CANAL.—Ten or twelve hands are employed by the Amador Canal Co. in digging the ditch for the second pipe across Jackson creek. The pipe will be 15 inches in diameter. It will necessitate the cleaning out of the Moore ditch, and its enlargement in places. The job will take two or three week.

El Dorado.

POCKET MINE.—Georgetown *Gazette*, Sept. 29: We visited Sam Watson's new pocket mine, from which he has taken more than a thousand dollars within the past few months, and has a good prospect of taking out more. This claim is a mile and a half south of town, and on the same line of slate which passes through the Rich Gulch and Crane's mines. Mr. Watson has now before his eyes an evidence of more pockets near by. Much of the quartz he has been sluicing and throwing away he has discovered will pay to mill. Some pieces of the quartz we found lying around showed well in gold.

Inyo.

BROWN MONSTER.—*Independent*, Sept. 29: Four men are taking out fine galena ore for shipment from the Brown Monster mine. At present 10 tons are sacked and ready for transportation. A lot of Mexicans are extracting ore on the hill above the Brown Monster.

THE OLD "UNION" MINE. Silas Reynolds and T. Treglowen have 15 tons of ore on their dump ready for shipment.

THE HIRSCH. A fine body of copper of high grade, together with a showing of galena, has been recently exposed.

CERRO GORDO.—The rumor comes that new parties are intent upon mining in old Cerro Gordo district. A couple of men lately made an important strike in an old mine formerly worked by Jack Moore. The ore vein is 12 or 14 inches wide, and consists of silver-lead assaying $1,000 to the ton. It is said that Belshaw is making arrangements to return in person and start up the old Union.

Mariposa.

DILTZ MINE.—*Gazette*, Sept. 29: The shaft upon this mine has reached the depth of 114 ft. At this depth vein and vein matter show five ft in thickness between well defined walls. The vein, some of which is solid and some discomposed, is all diffused with gold, and grows richer as the shaft goes down. During the week several tons of ore have been stoped out from the 75 level, which opens out most satisfactorily.

CANNON.—This mine is contiguous to the Diltz and belongs to the same property. Within the past week Captain Diltz has reopened this old mine and extracted several tons of ore, which upon test show that the rock will average from $12 to $15 per ton. It is a well defined vein four ft thick, and shows free gold.

BUENA VISTA.—This mine is half a mile from the above. Captain Diltz has had the group of mines fully represented to a London company, who have the same under consideration. It is hoped something will be done toward developing these mines.

Modoc.

RICH DIRT.—Adin *Argus*, Sept. 20: One day this week one pound of dirt taken from the Juniper mine at Hayden Hill was washed out carefully and found to contain $16.75 in gold. This statement is vouched for by our Hayden Hill correspondent, a reliable gentleman and practical miner.

ANOTHER.—J. W. Hayden, one of the two original locators of Hayden Hill mining district, and the man for whom the hill and district are named, has discovered a new gold mine, seven miles east of Hayden Hill.

MORE ABOUT IT.—The new mines discovered by Messrs. Hayden and Lewis have caused no little excitement. A new Mining District has been formed, called the "St. Louis." Seven claims were staked off last week, many more locations will probably be made.

Mono.

MAY LUNDY.—Homer *Index*, Sept. 29: The stopes in the May Lundy have shown no change during the week, but a decided improvement in the lower levels is observable. The face shows four feet of clean ore of high grade, much of it horning out $200 to the ton. The south drift is carrying 20 inches of very rich ore.

GORILLA.—The Gorilla mine and reduction works are being run day and night. The mine is in excellent condition. During the week work was resumed on the Lucky Morton, the first northerly extension of the May Lundy.

JORDAN.—The Virginia Creek Hydraulic Co. is shipping considerable quantities of gold dust from their works near the Old Mono diggings.

STANDARD CON.—*Free Press*, Sept. 29: The Standard Con. mill resumed operations yesterday, much to the satisfaction of all hands. The new engine is of 170 horse-power. Everything is now in excellent order, and the roar of the dropping stamps will make pleasant music through the entire winter.

Nevada.

NEVADA CITY MINE.—*Transcript*, Sept. 20: At the Nevada City another level is being sunk for, the incline now being about 35 feet below the 600. The next level will be started at a depth of 700 or 750 ft, as may be decided later. The mine is paying profits right along.

BUELOW.—There is in the Buelow Con. claim a ledge 80 feet wide and cropping out at the surface, that promises good results. While out there Sunday Dr. Buelow got a lot of the ore, which is greenish in color and of slate formation, and has had several assays made of it. By amalgamation it gives $8 a ton and by fire assay $70 to $80. It is alive with sulphurets.

DERBEC.—Grass Valley *Tidings*, Sept. 28: We visited the tunnel of the Derbec mine in company with Mr. De Noon, the Supt. There has been a great deal of work done about that institution. Work has been in progress a year and four months, and as a result, they have a tunnel in the hill 3,800 feet, through which the gravel is hauled in cars holding nearly a ton. About 250 loads of gravel per day are taken out of the tunnel.

Placer.

A SALE.—*Herald*, Sept. 29: We gave it as a rumor that the Hawkins and Peardon boys had sold their mine, the Morning Star, at Shipley ridge, below Ophir. The sale of the Belmont, located near by, is also reported in this week's paper. The two mines, we understand, are sold to one company, the reported price for both being $130,000.

BELMONT.—I am informed by good authority that the Belmont mine has changed hands to Eastern parties, understood price $65,000.

DAMASCUS.—T. C. Brome, of Damascus, says the old Bob Lewis drift claim at that place, owned by Lewis and Griffith, is paying first-rate, and as soon as they can arrange for getting more water to wash their gravel, will show big. They are on a lead of blue gravel that is proved to be rich and extensive. In the old Mountain Gate they are preparing to put in a large overshot water wheel underground for the purpose of pumping the water and hoisting the gravel from the rich blue lead channel, some 40 ft below their old tunnel.

PENNSYLVANIA FLAT.—Placerville *Democrat*, Sept. 29: D. M. Jacott came over on Wednesday from Pennsylvania Flat, in Placer County, where the Ralson Bros., Samuel F. and William C., Jr., are working the gravel claim formerly operated by Blair and Peas. These young men are getting the claim is first-class shape for operating on a large scale this winter. Mrs. W. C. Ralston, mother of these young men, has gone up there to make her home.

Plumas.

GOLD STRIPE.—Greenville *Bulletin*, Oct. 2: On Monday morning the miners in the Gold Stripe stopped worked. The mill will continue to run until Friday, when all the ore at the dump will be worked up. It is reported that there is no ore in sight and that no prospecting will be done unless the shareholders furnish money.

San Bernardino.

CALICO.—W. T. Grant writes the Inyo *Independent*, of Sept. 29: I do believe that in one year San Bernardino will be the banner mining county of the state. The King mine is turning out a whole lot of bullion monthly. Uncle Billy Raymond has got his fins in again, and is going to make bushels of money out of his interests here, particularly the Garfield mine. All his old friends say he has struck the right country again. He is now in the city looking after a mill to work his ores.

Shasta.

DEADWOOD.—*Democrat*, Sept. 26: Tom Green was in town Thursday to receive a small quartz mill and engine he purchased below. The mill has a capacity of six tons. It was shipped to Deadwood, and will be erected on his claim immediately. Tom is satisfied he will make some money.

NOTES.—*Republican Free Press*, Sept. 29: Mr. Flemming's mine pays better than ever. He has just been rewarded with $155.50—the result of ten days' run. Dan O'Neal has just made a clean-up; he would not tell how much he made, but to judge from the pleased expression of his countenance it was immense.

Sierra.

INDEPENDENT.—*Tribune*, Sept. 27: F. Harland, last week secured a bond until the 1st of next July on the Independent quartz mine, 10 miles south of this place. The Independent and Franco-American quartz lodes are prominent on account of their large croppings. The first was worked as early as 1860, arastras being used. In 1868 an 8-stamp mill was built at a cost of $6,500. The mill has a capacity of 8 tons in 24 hours and is driven by a 20 ft overshot wheel. The quartz is rich in free gold and also contains a high percentage of rich gold-bearing sulphurets. We are informed that the mine has yielded $20,000 during the time that the mill has been run by the present owners. The average of the ore is $20 per ton.

Trinity

DEADWOOD.—*Journal*, Sept. 29: John E. Gibson writes us that they have struck the lode in the Enterprise mine at 185 ft, the rock averaging from $25 to $30 to the ton, and indications favorable for better when they get further in.

GETTING READY. James Blakemore tells us that they have 12 men at work on the ledge on Jenning's gulch, and are building an arastra. Everything is in good shape, the rock looking splendidly, and when water comes they will take out money.

NEW RIVER. Cor. *Journal*: San Francisco parties have purchased the Portuguese mine on Big Flat and Boles & Gulich's Devil Canyon ditch. They intend extending down the river for the purpose of working Rattlesnake Bar opposite Big Flat. Boles & Co. have gone down 56 ft, the vein is 30 inches wide at the bottom of the shaft and prospects $50 per ton. Mr. Sherwood has men of capital interested with him. They are down 70 ft and have 45 tons of ore on the dump that assays $60 per ton. Ladd, Clifford & Co. have a splendid overshot wheel, 24 ft in diameter. G. V. Healey, on his Ridgeway ledge, is pounding out from $4 to $6 per day with a hand mortar. R. L. Thomas has discovered an extension of the Hard-tack lode that prospects big.

FRENCH GULCH. *Republican Free Press*, Sept.

29: Muldoon, the superintendent of W. P. Coleman's mine, is in high spirits. He says the mine never looked so well, and is now showing first-class ore, sufficient to keep a 10-stamp mill going for a solid year. E. Franck and the McDonald boys have also struck recently very rich rock.

Tuolumne.

SHORT OF WATER. *Independent*, Sept. 29: The water was shut off from the main ditch of the T. & W. Co. on Thursday, and there will be no more water from that source until the rains set in. This necessitates the shutting down of the Quartz Mountain mill, the Little Gem mine, and the gravel mines in Table mountain.

RICH QUARTZ. *Democrat*, Sept. 29: Some exceedingly rich quartz is being taken out of the Soulsbyville mine at Soulsbyville. Some of the rock goes as high as $200 per ton. A very good quality of quartz has been struck in the Rising Sun mine below the tunnel. Work on the new mill is progressing rapidly.

NEVADA.

Washoe District.

UNION CON. *Enterprise*, Sept. 29: On the 3000 level west cross-cut No. 2 is out about 22 ft. It is still cutting streaks of ore. These streaks have swung around to the west till they are now going in nearly the same direction as the cross-cut. The 7-ft streak of ore has probably turned in the same direction as the smaller outlying streaks; at least, nothing like it has yet been found.

OPHIR. Are now getting things in shape for regular mining. On the 150 level connection has been made with the winze down from the works in the old croppings. This connection gives a good circulation of air, and the winze may be utilized as a chute down which to send ore from the openings in the croppings. A winze will now be sunk well out west, to a depth of about 200 ft, and the ground opened in good shape.

HALE AND NORCROSS.—The station on the 2700 level is nearly finished. From this station a drift will be run a short distance north, when it will be turned west as a cross-cut. On the 2000 level the cross-cut going west is out about 25 ft. It is cutting streaks of quartz that stand nearly vertical.

MEXICAN.—The upraise from the 2900 level will soon connect with the bottom of the winze down from the 2700 level. There is but a few feet to go to reach the bottom of the winze. The northwest drift on the 3100 level is still advancing in dry ground.

SIERRA NEVADA.—The north drift on the 2900 level is advancing at the rate of 25 ft per week. The joint Union Con. winze below the 3000 level is fast approaching the 3100 level. The bottom is showing streaks of quartz of low grade.

ALTA.—The water is being rapidly drained from the lower levels. The tanks and pumps are kept in constant motion.

UTAH. Good headway is making in the north drift on the 1350 level. The ground is in vein porphyry, which blasts well.

COMBINATION SHAFT.—The station below the 2600 level for the new hydraulic pump is being excavated very rapidly, and will soon be completed. It will form a vast hall 100 ft long, 25 ft wide and 15 ft high.

YELLOW JACKET.—Very little can be done in the way of mining at present, but all is being kept in excellent order for a start as soon as there is sufficient water in the Carson river to start the mill.

SCORPION.—Good progress is being made on the 500 level on the west cross-cut. Occasional streaks of quartz of good appearance are being cut.

SOLID SILVER.—During the week have been engaged in clearing the track of the rock that had fallen upon it in many places from the roof of the tunnel.

IMPERIAL.—They have had steam up at the hoisting works, and will soon be ready to begin mining operations in earnest in the old upper level.

CROWN POINT.—Nothing is now being done in the mine, but all is in good shape for starting up as soon as the mills on the Carson river can be run.

NORTH GOULD AND CURRY.—Good progress is making in sinking the shaft. At present they are engaged in timbering up at the bottom.

CALIFORNIA.—Are again sinking joint Consolidated Virginia No. 2, and fair progress is being made in the work.

BEST AND BELCHER.—The west drift is gradually draining out, and work may soon be resumed.

GOULD AND CURRY.—East cross-cut No. 3 is being advanced in vein material of favorable character.

CON. VIRGINIA.—Good progress is being made in sinking joint California winze No. 2.

BELCHER.—Are awaiting the starting up of the mills on the river.

OVERMAN.—Are extracting some ore from the old upper levels.

UNION SHAFT.—Are easing timbers at the 2300 station.

Belmont District.

OPHIR CANYON.—*Courier*, Sept. 22: A. Lognoz denies the report that the mill in Ophir Canyon has shut down and that work has been suspended. He says the mill is running night and day and is producing the usual quantity of fine bullion. It is probable that a sufficient amount of money will be raised to sink the shaft.

BELMONT MINE.—The report from Supt. Fassett, for Sept. 22d, is as follows: "The level in Laity ground is 268 ft in length. Stopes looking well. The first cross-cut, 110 ft south of Highbridge shaft, is just started into the ledge, showing good $100 ore. Moore & Marting ground yielding high grade ore. Shall commence extracting ore from South Tunnel on Monday."

JEFFERSON.—The work of extracting ore from the Keystone mine at Jefferson progresses nicely. Work in the Jefferson Carbonate mine is pushed with energy, and the ore now being extracted is of excellent quality.

Eureka District.

ANOTHER SET-BACK.—Eureka *Sentinel*, Sept. 29: A fresh fountain somewhere broke loose yesterday in the Eureka Con. new shaft and caused the water to rise to 75 ft. On Wednesday all was working well, the water in the shaft having been lowered to 29 ft. Work has been stopped for the present, and the pump will be taken to the surface and overhauled, when it will be started up again. Had not this additional flood come in, the shaft would have been dried to the bottom in three or four days more.

NOTES.—A strike of good ore was yesterday reported in the Prospect Mountain tunnel. A promising change is noted in the formation in the extension of the flue dust tunnel at the Albion. The quality of ore from the Geddes mine at Secret Canyon is rapidly improving. The Kelley mine at Secret Canyon, is being worked on lease. The shaft is 70 ft deep, and in a drift run from the bottom of it some very fine ore has lately been struck. It is stated that the new find in the Albion mine is a good one. The ore body is in virgin ground at a distance from where any ore has been found heretofore. The body is 18 ft from wall to wall, and the ore gives assays as high as $130 per ton.

Bernice District.

GOLDEN CROWN. *Silver State*, Sept. 15: O. G. Rappleye arrived from Bernice yesterday. He says the mill is running on ore from Wallace Goodell's mine, the Golden Crown. Water is scarce in the district just now, and the supply is barely sufficient to run the mill. There is ore enough to sight in the mines partially opened to run the mill for years.

Humboldt District.

CEDAR. *Silver State*, Sept. 24: A new mining district has been organized in the Antelope range of mountains, 18 miles from Humboldt house, and named Cedar district. Years ago rich float rock was found in that section, but nothing was done towards tracing it up. This summer Jehiel Smith found some galena partly oxidized near the base of a bluff, which led him to prospect. He succeeded in finding a body of galena 20 ft wide, and carrying from $100 to $200 in silver to the ton. He has been for some weeks prospecting his find, and is of the opinion that it is one of the largest bodies of ore ever found in the State.

Tuscarora District.

ARGENTA. *Times-Review*, Sept. 27: North cross-cut on the 400 level is in 106 ft. Progress for the week, 10 ft.

ELKO CON. Shaft No. 2 has been extended 6 ft during the past week. Total depth 137 ft.

NORTH BELLE ISLE. Fair progress has been made in extending the drift south on the 300 level. Stopes on the 70 level are without change.

NAVAJO. Total length of cross-cut east, 650 level, 54 ft. No work will be done in the west cross-cut until the pumps are in working order.

GRAND PRIZE. West drift in the 300 level, north lateral drift, is in 155 ft. Progress for the week, 13 ft. North cross-cut on the 400 level is in 66 ft. Progress for the week, 24 ft.

BELLE ISLE. Cross-cut east from north drift, 450 level, has been extended 8 ft. Work in the face of the drift has been suspended. Upraise from the 350 level has been carried up 19 ft.

INDEPENDENCE.—Total length of drift north on the 300 level, 816 ft; progress during the week, 21 ft. The flow of water continues about the same. Upraise from the 400 level has been carried up 20 ft and timbered.

ARIZONA.

TOMBSTONE.—*Epitaph*, Sept. 25: Work on the pumps in the Contention mine is going on, the old Flora Morrison hoisting engine being now in place. The pumps are a double set of 12-inch Cornish pattern, similar to those used on the Comstock lode. These will be the largest pumps yet erected in this territory. They will be in running order by December 1st.

PROMPTER.—The ledge, running through the entire length of the claim, is worked by seven shafts, the deepest, No. 5, being down to a depth of 340 feet. While making connection between shafts Nos. 4 and 5 a large body of ore was struck. Of six assays made of this ore, the lowest went 135, while the highest carried 2,423 ounces of silver to the ton. Drifting is being pushed on vigorously, and large quantities of ore are accumulating on the dumps.

GREENLEE.—There are about 150 claims now taken up in the new silver district, and the work of developing some of the richest claims has already commenced. Several shafts are being sunk, and as depth is gained the ore increases in quantity and quality, there being gold enough to pay expenses of extracting the ore. The highest assays made, so far, returned 1,281 ounces silver and $27 in gold. One assays, from pieces of rock knocked off from the surface of the ledge on 13 different claims, returned 168 ounces silver and $24 in gold. If these mines prove to be as good as is anticipated by experienced miners, the new camp will be one of the richest in the territory.

GROUND HOG.—*Epitaph*, Sept. 22: The latest strike is in Ground Hog, which occurred yesterday at a depth of 103 ft. The vein had gone down to that depth, carrying ore which averaged about $75, when yesterday the workmen came upon a streak about 8 inches wide which was literally filled with silver, the pay being fully 3 ft wide, and averaging up into the hundreds. A sample of the horn-silver can be seen at the Billiard Parlor, which will do your eyes good to look at.

OLD DOMINION. *Silver Belt*, Sept. 22: Shipments of Old Dominion for the week: 856 bars—237,680 pounds. Second furnace was started on Saturday last. Good supply of coke, and teams are arriving daily with more.

ROGERS DISTRICT.—Pinal *Drill*, Sept. 22: On the Robin, assessment work has been done. The shaft is down 90 ft, from the bottom of which they have drifted 35 ft, on a pay streak two ft in width. There are 30 tons of ore on the dump. On the Worldbeater, work started on a new shaft at the top of the hill is now down 16 ft, disclosing a four-foot vein, with a pay streak twelve inches wide, of very good ore. On the Silver Chief, assessment work has been done. A drift 18 ft long from the bottom of the shaft shows two ft of very rich metal, in white quartz. The Chief looks better now than it ever has done since its discovery. On the Snap, Mr. Tolles is taking out fine ore from a drift in the vein. He has a big pile of ore on the dump.

SOUTHERN PIMA.—Tombstone *Epitaph*, Sept. 19: J. R. Manning, of Crittenden, Pima county, represents his section as being in a prosperous condition. The Alta mine at Harshaw, owned by Luttrell & Salisbury, has been pumped and the extraction of ore is progressing. The ore, which is said to average $75 per ton, will be shipped to the Benson smelter at the rate of one car-load 115 tons) daily. On the western slope of the Patagonias, Judge Fuqua and others have recently made an extraordinary discovery. It consists of a mammoth ledge 100 ft in width, in which occur frequent stringers of native and horn silver. The owners are quietly developing their property, and Mr. Manning thinks it will prove to be one of the biggest mines in Arizona.

PINE SPRING.—Prescott *Miner*, Sept. 21: The Pine Spring it down 100 ft. Drifts are now to be run in on the ledge south and north with a view of ascertaining whether the rich ore found in the shaft extends along the ledge. If the same extends any considerable distance, the Pine Spring can be put down as the richest property in Arizona.

HIDDEN TREASURE.—*Courier*, Sept. 22: Theo. L. Chase, of the Hidden Treasure Co., Turkey creek, was here yesterday. From him we learned that he has, in dump, 150 tons of ore that will pay. The Hidden Treasure is opened by shaft to a depth of 200 ft.

COLORADO.

LITTLE EMMA.—Georgetown *Courier*, Sept. 20: The Little Emma mine, on Democrat mountain, is proving itself one of the richest. Some very high-grade mineral is coming out. The following are some of the late mill runs of mineral taken from this level, as shown by the assay certificates of the Rocky Mountain mill: 554 pounds ran 136 ounces per ton; 168 pounds, 446 ounces; 4,924 pounds, 371¼ ounces; 466 pounds, 1,149 ounces silver per ton. The average mill run of all the ore produced is over 500 ozs. This can not be beaten in the State. Assays of the ore have run as high as 27,000, and mill runs 11,000 ounces per ton.

SUMMIT CON.—This mine, on Saxon mountain, has made a recent strike. The 179-foot level from the main shaft is in excellent pay. A cross-cut from the bottom of the main shaft was started for the purpose of striking the hanging wall, when, at the distance of 11 feet, a body of rich ore was encountered. A mill run of the ore from this level was made with the following result: 1st class, 1,440 ozs.; 2d class, 328 ozs.; 3d class, 119 ozs. silver per ton. The run of the 3d class ore was made merely to ascertain whether or not it would pay to treat.

BONANZA.—Pitkin *Independent*, Sept. 22: The developments of the Bonanza include 100 feet of incline and a 26-ft shaft—the last 25 feet of incline following about five feet of mineral in place, all pay, and mostly rich. The ore contains chlorides, sulphurets, silver-glance, and carbonate of lead. Assays lately obtained are as follows: No. 1, 48 ounces silver per ton; No. 4, 219 ounces; No. 5 (picked), 532 ounces. A good road has been constructed and a car-load of ore is now being delivered at the sampling works. We understand that the mineral which has latterly been followed in the Bonanza was discovered in 1879, when a small but handsome streak of ore was exposed. The owners, wishing to sell, and fearing a pinch, were timid about going in on it, and have since been gophering around to open the vein in another place. Lately, urged by some of our best miners, they began running on the mineral, and in less than ten feet had a five-ft breast of ore, which has since averaged that width, and passed from line into good quartzite and porphyry walls.

JOE REYNOLDS.—*Miner*, Sept. 22: Three of the four lodes composing this famous Silver creek property are being actively worked by seven parties of lessees, numbering in all twenty-four men. East of the Abeel cross-cut they have opened up ten inches of solid, high-grade ore, from which an assay of 2,200 ounces has just been had. About eighteen months ago the lodes were practically abandoned. James Dailey, the present Supt., had run 140 feet, following the soft gangue which was then supposed to be the only road to the mineral. After exhausting all his resources, he one day drove a drill into the north wall. At three inches it struck something hard. He continued pounding away, dulling every drill, until a seven-inch hole was finally bored, and a shot put off in it. Twenty inches of rich mineral was uncovered, which has since been shown to extend, with some variations, the whole length of the 140 ft of level above mentioned, and how much farther no one yet knows.

LITTLE ALICE PLACER.—*Register-Call*, Sept. 21: The lessees of the Little Alice company's placer mine last week cleaned up fifteen sluice-boxes from a five day's run, four miners working, the yield being 85 ounces, which bronght at the bank in Denver $16.50 per ounce. Several pieces of native silver were taken out of the sluices, one of them weighing righteen pennyweights.

IDAHO.

MORTON.—Wood River *Times*, Sept. 19: Price and Scott agree to put a force of men at work on the Morton mine immediately, and take the property within sixty days. The price to be paid is $20,000, in three payments, two of $5,000, and one of $10,000. This is for 100 feet of the ground.

SAWTOOTH.—Ketchum *Keystone*, Sept. 19: A. L. Richardson, who returned from Sawtooth last evening, reports considerable stir in Sawtooth, from the success of the Columbia and Beaver mill. The camp is picking up life, and everybody is possessed with hope that the day of resurrection has arrived. The C. and B. mill was to have turned a large bar ont to-day.

ELKHORN.—We are informed by Supt. Lewis, of the Elkhorn, that new developments have placed in sight large bodies of high-grade galena. This shows a continuous body of first-class ore, and exhibits the property to greater advantage than ever before. The average net receipt for every ton of first-class ore shipped from the mine to the Philadelphia smelters is $165, after transportation and reduction. Thirty-five men are employed on the works.

ALVIN.—The Alvin mine, on Boyle Mountain, has received the following returns from the Philadelphia smelters for 131 sacks, weighing 16,855 lbs. net of first-class ore. The value per ton, $196.05; deduction for cost of smelting per ton, $47.05; net receipts per ton, $149; total receipts, $1,256.11. This is the yield of one prospect barely developed into a mine.

LOST RIVER.—*Keystone*, Sept. 22: The newly discovered mineral belt on Lost River, from the headwaters of Alder creek to the headwaters of Antelope creek, is about 10 miles long and 5 miles wide. The Hermes mine, discovered in July and owned by McAllister and Powers, has been developed to a depth of 20 ft, first appearing on the surface as a 14-inch vein and now widened to 3½ ft of good carbonate and galena ores, with an average assay value of 127 ounces silver and 70 per cent lead. The Hermes contains a ledge of 6 or 7 ft, with good walls. The highest assay returns for the ore are 200 ounces. Woodruff's copper mine is one of the biggest things in the country, and is reported similar to the famous Peacock copper mines in Northern Idaho. It is of such magnitude as to require parallel locations to include the whole. Extending over the entire width, large bodies of rich copper ore are found, and the whole gives the appearance of a well defined ledge, with walls in place, on an immense scale. The ore runs from 16 to 30 per cent copper.

PHILADELPHIA. Ore receipts at the Philadelphia smelters have grown so large that the company has been obliged to place a limit on the purchase of high-grade ores until better transportation than the winter season will allow does away with the risk of too much dormant capital.

BANNER. Idaho *World*, Sept. 18: The Banner mine has a rich pay rhute 300 ft in length, and how much further is not known. They are still going ahead with east drift, and the vein holds its width, and the ore continues rich.

MONTANA.

ALICE.—Butte *Miner*, Sept. 18: The underground workings of the Alice never looked better. The west drift from the 800 has advanced 125 ft on the ledge, which maintains its general width and grade; sample assays yesterday yielding 60 ounces in silver. The vein developed in the 100 and 200 ft east drifts has been uncovered in the 300, showing 3½ ft wide in the face of the drift and assaying from 40 to 60 ounces. The mills are with their 80 stamps doing extraordinary work, 2884 tons of ore having been milled in August, producing bullion valued at $117,300. The money that would have been disbursed in dividends has been applied to the acquisition of the Magna Charta and the Valdemere, to putting in new machinery, to building the great tramway, and to the development of the property. These are dividends which are trangible.

BELL.—The Bell mine is 400 ft down in its new shaft, where the vein measures from 8 to 24 ft thick, and is all pay ore. A splendid block was shown weighing over 200 pounds and covered with native silver, containing about $250 worth of it, and 50 per cent of copper. The mine has a 60-ton smelter in operation, and ships 10 tons of matte per day.

LEXINGTON.—The Lexington is 500 ft deep. It has 60 stamps in operation. The output from January 1st for seven months has been $742,000. The ore pulps $55 per ton. The mine showed specimens containing native silver.

ANACONDA.—The Anaconda is by many considered the second best copper mine in the world after the Calumet and Hecla. The company is putting in machinery costing $90,000, a 500-ton smelter being part of it. There is a 40 ft vein of solid ore carrying from 20 to 70 per cent of copper.

NEW MEXICO.

FLEMING.—*Southwest Sentinel*, Sept. 22: The Columbia is one of the most promising prospects in Grant county. The shaft is now 70 ft in depth, and shows from the surface to the bottom a well defined vein of ore having a milling value of $125 per ton, and extra selected first-class will mill from $500 to $800 per ton. The vein occurs in granite, runs north of east, and is almost vertical in its slip. The mineral consists of chlorides and sulphurets of silver associated with heavy spar and talcose matter.

IVANHOE.—"We are running all our silver ores into copper matte—Ivanhoe ores with our custom ores. The matte assays 50 per cent copper and averages 150 ounces in silver. We have now ready for shipment three car-loads of matte, and have already shipped several to Denver. We are smelting forty tons of ore every twenty-four hours. We made one run of twenty-four hours on raw Ivanhoe galena ore and got out seven tons of lead bullion, assaying 35 ounces per ton in silver."

OLD MAN.—The Carrollton mill was sold at Sheriff's sale last Monday, and J. W. Fleming was the purchaser. The price paid was $7,060. Jack will at once put the mill in thorough repair, and start it up on Old Man ore. He expects to have a thousand tons ready for treatment by the time every thing is in working shape at the mill.

SILVER CITY.—Las Vegas *Gazette*, Sept. 19: The new discoveries and active operations in Grant county have produced marvelous results. To the output of the already well known mines have been added rich new finds. Fleming is regaining strength rapidly. The mines are showing up better every day. Thirteen hundred sacks of rich ore from the Old Man await shipment, and it is learned that the property is likely to be sold to Colorado capitalists. The Penrose group is being worked by the owners.

OREGON.

SNAKE RIVER PLACERS.—Reno *Gazette*, Sept. 26: It is reported to the Ogden *Pilot* that the placer mines near Eagle Rock, on Snake river are paying from $5 to $15 per day to the man, and that the ground is taken up for 8 miles.

WASHINGTON.

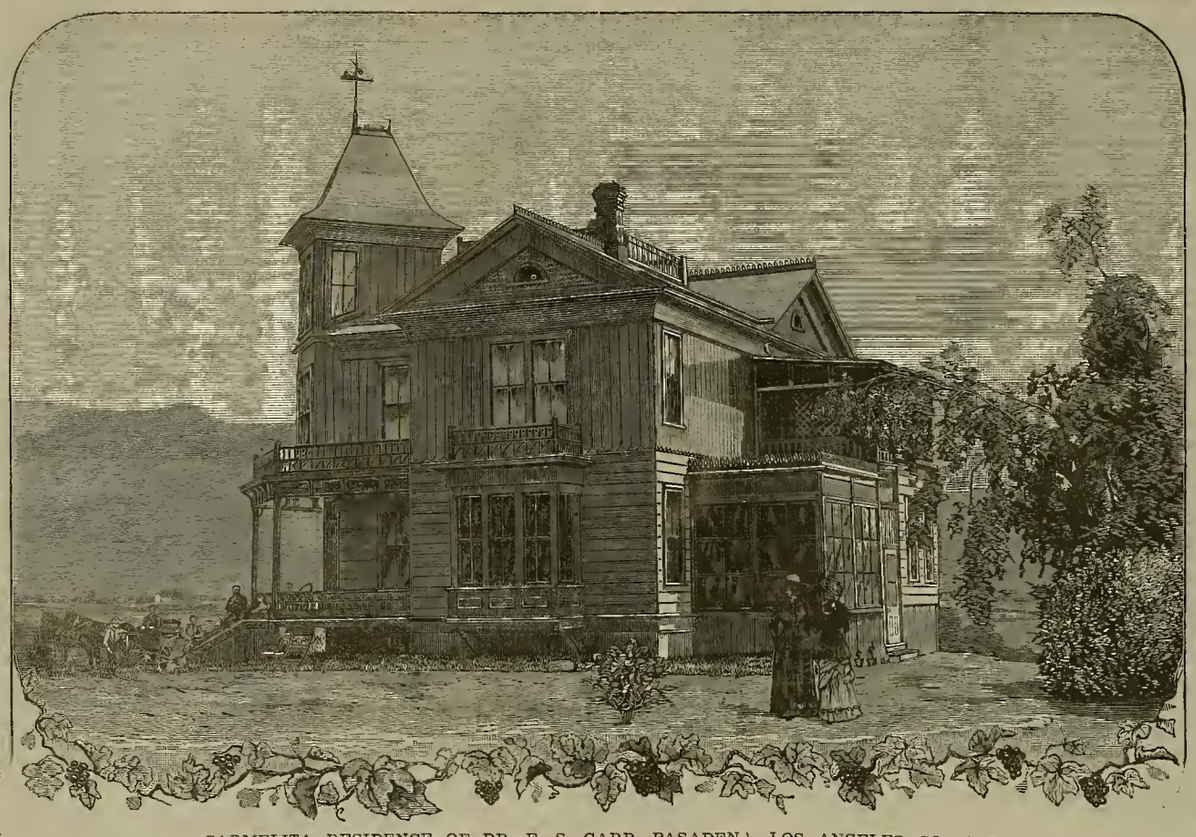
NEW PLACERS.—Walla Walla *Union*, Sept. 22: Hon. Jacob Stitzel reports that while at Spokanefalls he met Geo. B. Warnacott, of Rathdrum, who informed him that the new placer diggings in the Coeur d'Alene mountains are very rich and quite extensive. He had $100 worth of dust with him. The mines are about 80 miles from Rathdrum, and a point 20 miles from the mines can be reached by boats on the lake. The diggings are said to pay from the grass roots to the bedrock, about three ft. The gold is free from quartz and is rated by Portland assayers as "$16.50 dust." One nugget weighing $27 has been found. Over 100 men were at the mines, and more are are going in every day. At present only the rudest appliances, rockers and pans, for saving the dust are employed, and yet so rich is the ground that those in the mines are making from $10 to $20 per day "to the hand." A number of parties have been formed in the upper country to go to the new mines, and a big rush is expected.

Carmelita.

[Written by JEANNE C. CARR.]

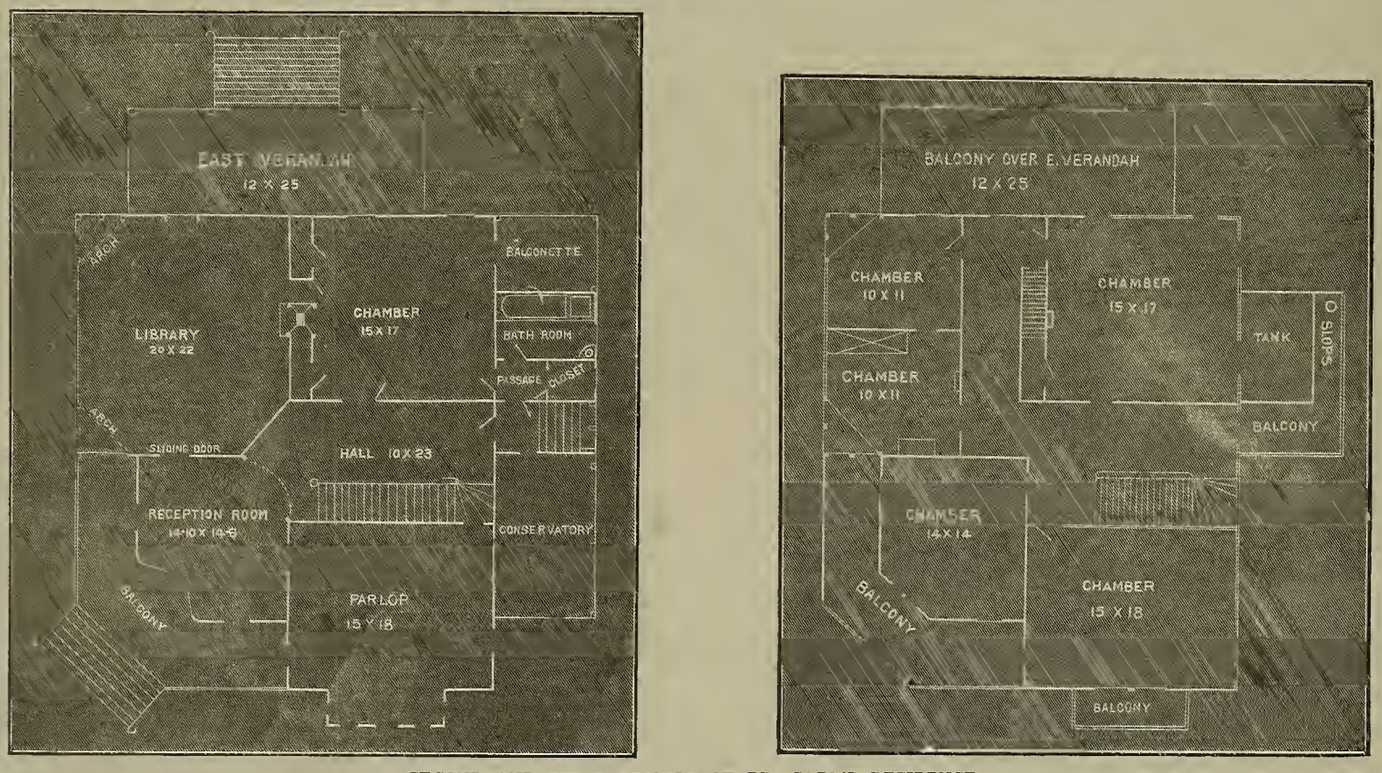
Carmelita is a Hebrew word with a Spanish termination, and means simply "a little orchard or vineyard." Thus our home had named itself before the house "with many windows" enlarged for us the ever beautiful and varied landscape of Pasadena. The house, a trap to catch the winter sunshine and every passing summer breeze, is planned for living in the open air. Every room in the two main stories opens upon a veranda or balcony, while the spacious deck upon the roof invites to star-gazing, and commands a glorious view of eighty miles of mountain range, and a glimpse of the peaceful sea.

It may be a useful study for some of the readers of the PRESS this house plan of ours, which is little more than the old-fashioned square house of four rooms on each floor, and a central hall or vestibule, into which all the rooms open. By reference to the floor plan of the main story (page 214) it will be seen that two modifications of this very common style give all the picturesque effect, viz: making an entrance in the corner of a room, out of which a veranda has been taken, and breaking the too formal outline of the roof by throwing up a very simple tower. A veranda around a house of the size required for our purposes was too expensive both to build and keep in order. We find the plan we adopted gives us every advantage, with the additional one of leaving our views more unobstructed. The reception room, divided by a portico from the staircase hall, is a cosy apartment. Its balcony or veranda is made to serve three stories, as it gives a balcony to the three chambers, and covers one entrance to the basement. One of the most difficult problems in home building is the placing of bath-rooms, water-closets, woodhouses, and sculleries, so as to meet the demands of convenience, good taste and sanitary science. Luckily for us, we are set on a hill, thereby the question of thorough drainage was not troublesome, but, on the other hand, the sightliness of the location forbade a "lean-to," or backyard, and not even a clothes-line was admissible here; hence the conservatory, with tankhouse over the bath-room, seen on the right of the picture. The broad steps leading from the east veranda cover a woodhouse and water-closet, which are entirely concealed from sight either from within or the outside. By placing the main story bath-room and closets in the end of the conservatory protection, perfect drainage was secured, and the necessity of having any soilor water pipe running under or within the dwelling obviated.



We could afford only one bay-window, but have the full interior effect of seven others, by placing the windows in the corners of the rooms wherever practicable. This plan greatly improves the appearance of the rooms, and gives better space for furniture. Poles and simple brackets hold the curtains, which make cosy alcoves of all these window corners. Wooden mantels and brick fireplaces help to keep the expression of a country home, which marble or artificial stone would have spoiled. All the woodwork of the interior is oiled or shellaced. The vertical boarding of the upper story is the natural color of the redwood; the main story is painted olive-green; the concrete walls of the basement Indian red. When our Bermuda grass carpet covers the lawn, and the ivy and clematis drape porch and window, we shall be satisfied with the effect. Most housekeepers hate a basement; but every one who sees ours is loud in praise of its convenience and pleasantness. The east side, which contains dining-room, kitchen and lobby, is on the ground level. All the windows command beautiful views. Pushing the excavation back into the hill we got an excellent cellar, light and well ventilated. This story is the most elaborately furnished. The lobby under the reception room is furnished as an office for our fruit business. An outside door leads into the garden; another door opens directly into the cellar where we have a large table for the exhibition of our dried and preserved fruits. During the Conclave week scores of Eastern visitors sampled the raisins, prunes and varieties of crystallized fruits. In the office we have a collection of cones and natural curiosities of the coast, and a standing exhibit of cocoons and silk of our own raising.

Those of the readers of the PRESS who have visited Woodward's Gardens will not fail to remember a picture opening from the pavilion into the tropic conservatory. Through a single plate of glass set in a gilt frame one sees into a wonderful miniature fernery, where beauty of form and grace of habit seem to reach perfection. Remembering this charming device, we incorporated it into the sideboard on the north wall of our dining-room. When the ferns are grown, and we use the hardier native species, one may see over their fronds the magnificent contour of the Sierra Madre, a living picture of priceless beauty, yet of trifling actual cost.



This dining-room is exactly a reproduction in most of its details of the Spanish adobe house. The square hearth tiles were once before the altar of the Mission Church at San Gabriel, and were many years since replaced by a wooden floor. Thus we have truly a consecrated hearth, worn by use of hundreds of worshipers who have left no other trace of their existence. We have a crane, too, in the capacious fireplace, and the seat in the corner window has hinged covers, the space below holding the newspapers and other rubbish which is in the housekeeper's way. In another corner we have a large wood-box. The kitchen and laundry are supplied with hot and cold water.

The morning side of the house this season is the western, commanding a view into the picturesque valley of the Arroyo Seco, and its rugged hills.

Pasadena, Sept. 5, 1883.

CARMELITA—RESIDENCE OF DR. E. S. CARR, PASADENA, LOS ANGELES CO., CAL.

SECOND AND THIRD STORIES OF DR. CARR'S RESIDENCE.

The Engineer.

The Jordan Canal.

The proposed Jordan canal—so called, if the project is carried out—would not be a canal at all, but a large inland sea, some 300 miles long, with an average of from 10 to 15 miles in breadth. The waters of the Dead Sea would be raised from their present level about 1,300 feet, and its area, of course, be largely increased. The river Jordan, the Dead Sea and Lake Tiberias, would all disappear, with some square miles of land, principally on the western side of the Jordan valley as now existing, and in their place would be a vast inland sheet of water, fertilizing the neighboring desert with the rainfall produced by the evaporation from its surface. Not a mere canal would thus be created, but a wide-open channel, traversing Palestine from north to south, navigable in every sense of the term, with safe harbors here and there on either side.

This scheme is by no means a new one. It was proposed, we believe, by the first Napoleon; but now it has attracted fresh interest from the demand for an increase of the facilities afforded by the Suez Canal. The scheme is put forward under the leadership of the Duke of Sutherland. Upon its opening, nearly all the memorial sites of sacred history, Jerusalem, Bethlehem and Nazereth chiefly being excepted, would disappear forever. Capernaum and Jerico; the Jordan and the Lake of Gennesaret, would be at the bottom of the sea. Half the histories of Joshua and Jesus could henceforth be illustrated only from ancient drawings and descriptions; further archæological discoveries in that region would be impossible, though at this very time the Palestine Exploration Fund has plans to excavate in many of the spots to be covered. On the other hand the ships of the world could steam over the place of Elijah's sacrifice; through the scene of so many notable battles, from the time of Deborah, and Saul, and Nebuchadnezzar to those of Richard the Lion-hearted and Napoleon the Great, and so past Gilboa into the new El Ghor; and within three or four miles of Jerusalem itself.

Biblical readers call to mind a singular prophesy, found in the forty-seventh chapter of Ezekiel, which they think would be fulfilled in the event of the completion of this work. If the reader will turn to that portion of the Old Testament, he or she will see how it speaks about bringing out the waters toward the east country into the desert and then down to the sea. It mentions, moreover, the healing of the waters and the appearance of a great multitude of fish. The coincidence of these passages with the details of the Palestine canal scheme is very curious, for the first may be taken to indicate the eastward flow from the Mediterranean through the cutting across the plain of Esdraelon, and thus on by way of the desert to the Red Sea, while the second may be thought to foreshadow the fate of the great Dead Leak of the Scriptures, its waters sweetened by contact with the invading stream, so as to admit the presence in its waters of the various kinds of fish. No other engineering project has ever contemplated such vast physical changes as this.

The Tunnel Between France and England.—Sir John Hawkshaw, civil engineer, recently stated that there were no engineering difficulties in the way of formation of the tunnel between France and England, and that its maintenance would be cheap. He estimated the cost of the tunnel at £8,000,000 and said the work would occupy in construction eight years. He had no doubt as to the financial success of the undertaking. It was reasonable to reckon upon 2,000,000 passengers being carried through the tunnel annually at 6s. per head, and 1,200,000 tons of goods at 5s. per ton. That would produce a revenue of £900,000. Allowing 40 per cent for working expenses, 6¾ per cent could then be paid upon the capital of £8,000,000. As one means of defense, it had been suggested that steps should be taken by which the tunnel could be flooded. He, however, was of opinion that arrangements could be made to throw up a mass of shingle inside the tunnel, and thus prevent its use. If necessary, the tunnel could be blown up. Should more than one tunnel be constructed, the question whether or not they should all be defended by forts was a question for a military man. If there were several tunnels they could be easily defended by the same fortifications on the English side. The tunnel would be 180 feet below the bed of the channel.

Captain Eads' Ship Railway.—Many will, perhaps, be surprised to learn that Captain Eads' much-talked of ship railway across the Isthmus of Tehauntepec has been begun. Captain Eads, having changed the views formerly held regarding the project, has secured ample grants from the Mexican government to permit the prosecution of the work, and ground was broken at the Atlantic terminus of the railway, in the latter part of May, some 150 miles southeast along the Mexican coast from Vera Cruz, almost directly south of Galveston and a little south of west of New Orleans.—*Iron Age.*

Useful Information.

Glass Clothing.

The ingenuity that led to the manufacture of articles of clothing from paper has been eclipsed, as similar articles are now made from glass. An up-town dry-goods store has on exhibition a glass tablecloth several feet square, of variegated colors, with ornamental border and fringed edges. The fabric is flexible and only a little heavier than those woven of flax, while it is claimed that it can be washed and ironed like an ordinary tablecloth. Glass has been spun and woven in Austria for some years, but it is a new undertaking in this country. A prominent glass manufacturing firm of Pittsburg, Pa., recently engaged in the manufacture of this brittle substance into fabrics, which they claim are as perfect, delicate and durable as the finest silk. A representative of this firm said yesterday that they can spin two hundred and fifty nine threads, each ten miles long, in one minute. The weaving is done with an ordinary loom, but the process is more difficult and much more interesting than the spinning of cotton or other threads. "We can duplicate in glass any costume," said this gentleman, "and can make it just as brilliant in color, elaborate in finish, perfect in fit, and equal in its smallest details even to the button on the original. The fabric is very strong, cannot be ripped or torn, and can be sold at a less price than linen, cotton or silk, or other fabric imitated. It is also very warm, easy-fitting and comfortable, whether worn as dress, shawl or other garment in ordinary clothing." Among the articles already manufactured of glass are beautiful feathers, which resemble those of the ostrich: towels napkins and tablecloths.—*Cincinnati Gazette.*

Receipts.

Perhaps the most unsatisfactory things in current scientific literature are the recipes given for making various substances, or for performing various operations. A recipe usually has a great fascination for one who has a little knowledge of the arts; and writers much given to the compilation of books like to produce a recipe book, and the greater the number within the covers the greater is the supposed value. Usually these are composed by men who have little practical knowledge, and a still smaller knowledge of chemistry. The result is a most horrible mingling of old and new chemistry, of directions which were obsolete 50 years ago, and of names which no chemist will now recognize. In general it is safe to say that 90 per cent of the directions given lack that definiteness which is essential to success. Some of them are criminal. For example, not long since many of the scientific papers published directions for etching glass, and without a single word of caution, either in regard to its terribly corrosive qualities or its dangerous fumes, directed their readers to use hydrofluoric acid. Those who know enough to safely handle the acid would also know all about its properties and how to use it for glass etching, and for those who had not this knowledge or experience it would be about as dangerous as giving a pound of gunpowder to a man unacquainted with its properties and remarking that it was combustible. Not long since one of our exchanges suggested that two ounces of pure rubber in thin slices dissolved in a pound of bisulphide of carbon would make a good cement for rubber belting. It adds, if kept long it thickens very soon. Only imagine some one with a leather belt to mend undertaking without further directions to make a pound of cement with bisulphide of carbon. The attempt would probably cause him to abhor bisulphide to the end of his life.

Oil Upon the Waters.

The efficacy of oil to assuage the violence of the waves at sea appears to be now very generally known, and to be becoming appreciated at its real value by mariners. Lately, we are informed by *Chambers' Journal*, the ship *Glamorganshire* was saved in a tempest in the North Sea by the timely use of oil, while a powerful steamer, the *Navarre*, in the same tempest, was overwhelmed by the waves and foundered, on the 6th of March, with all on board. The journal above named is so fully impressed with the importance of this subject, that it remarks that "ships that leave port unfurnished with oil, in case of emergency, are defrauded of one of their chief elements of safety."

The efficacy of this simple agency in stilling the waves of a turbulent sea has been so often spoken of by various writers, that to "pour oil on troubled waters" is a saying that has passed into a proverb. It is not a little curious, however, to notice how seldom its use is resorted to by vessels in distress, although a number of well authenticated cases are recorded which demonstrate beyond the shadow of a doubt that its effect in preventing the waves from breaking about a ship is simply marvelous. The remedy of employing canvas bags filled with oil and suspended in the water over the sides of the vessel is so simple a recourse in case of danger from the violence of the sea, that the mariner who fails to resort to it should be deserving of being called criminally ignorant.

How to Put on a Postage Stamp.—A man can always learn something if he will only look about him. I was at the Postoffice Department the other day, and I noticed an employe busy affixing stamps to envelopes. Every time he moistened the right corner of the envelope and then placed the stamp upon it. I asked him if there was any advantage in wetting the envelope instead of the stamp, and he said: "You notice that I moisten the envelope first; well, I do that because it is the right way. There is a right and a wrong way to everything, and, consequently, there is a right and a wrong way to put on postage stamps. It is impossible to moisten a stamp with the tongue unless a small proportion of the gum adheres to it. Now this gum is by no means injurious, but then the department do not advertise it as a health food, so the only way left is the right way, and that is to moisten the envelope first." After listening to this brief statement, I felt as though I had emerged from the deep shade of ignorance to the glorious sunlight of knowledge.—*Washington Letter.*

Barrel Hoops by Machinery.—Hoops of the half round shape, made from stout saplings, are in great demand. An expert cooper can make between 300 and 400 of these hoops in a day; and when it is considered that Chicago alone uses over 200,000,000 yearly, the necessity of some rapid method of manufacture exclusively by machinery is apparent. After repeated failures by all who have endeavored to overcome the difficulties incident to the construction of a hoop-making machine, the barriers seem to have been surmounted by a couple of Bostonians, whose invention, lately completed, makes from 20,000 to 30,000 half-round hoops a day, cutting two, three, or four from a pole, as occasion requires. This branch of barrel making is thus placed on a level with all the others in which machinery is the principal agent of construction. One of the results of the introduction of this new machine will be the utilization of ironwood saplings for hoops. This tough and almost indestructible wood, which easily resists the tools of the cooper, is handled without difficulty by the Boston hoop-making machine.

Wood pavement is to be given up in London. It has not only failed to realize the promised advantages, but has led, according to Prof. Tyndal's report, the serious affections of the eyes and lungs. By continual watering the wood became saturated with the nastiness of the London streets, and then, under the influence of the hot sun, gave forth a species of dust which was pernicious. The old McAdam system is to be restored.

Good Health.

Sick Headache.

Sick headache is sickness at stomach, a tendency to vomit, combined with pain in some part of the head, generally the left side. It is caused by there being too much bile in the system, from the fact that this bile is manufactured too rapidly, or is not worked out of the system fast enough by steady, active exercise. Hence, sedentary persons—those who do not walk about a great deal, but are seated in the house nearly all the time—are almost exclusively the victims of this distressing malady. It usually begins soon after waking in the morning, and lasts a day or two or more. There are many causes: the most frequent is derangement of the stomach by late and hearty suppers; by eating too soon after a regular meal (five hours should, at least, intervene); eating without an appetite; forcing food; eating after one is conscious of having had enough; eating too much of any favorite dish; eating something which the stomach cannot digest, or sour stomach. Any of these things may induce sick headache; all of them can be avoided.

Over-fatigue, or great mental emotion of any kind, a severe mental application, have brought on sick headache of the most distressing character in an hour. It is caused by indulgence in spirituous liquors. Decayed teeth are a frequent cause of the severest form of sick headache, through irritation of the nerves, and blood poisoning from the ulcerated teeth.

When a person has sick headache, there is no appetite; the very sight of food is hateful; the tongue is furred; the feet and hands are cold; and there is a feeling of general discomfort, with an utter indisposition to do any thing whatever.

A glass of warm water, into which has been rapidly stirred a heaping teaspoonful each of salt and mustard, by causing instantaneous vomiting, empties the stomach of the bile or indigested sour food, and a grateful relief is often experienced at once; and rest, with a few hours of sound, refreshing sleep, completes the cure, especially if the principal part of the next day or two is spent in mental diversion and out-door activities, not eating an atom of food—but drinking freely of cold water or hot teas—until you feel as if a piece of plain, cold bread and butter would "taste really good." Nine times in ten the cause of sick headache is in the fact that the stomach was not able to digest the food last introduced into it, either from its having been unsuitable, or excessive in quantity.

When the stomach is weak, a spoonful of the mildest, blandest food would cause an attack of sick headache, when ten times the amount might be taken in health, not only with impunity, but with positive advantage.

Those who are subject to "sick headache" eat too much and exercise too little, and have cold feet and constipation. There is also, in a majority of cases, neuralgia of the face caused by decayed teeth, or ulceration at the roots of teeth that appear to be sound. When this is the case there will be no permanent relief, while life lasts, without the assistance of a competent dentist. But where the teeth are not at fault, a diet of cobl bread and butter, and ripe fruit or berries, with moderate continuous exercise in the open air sufficient to keep up a very gentle perspiration, would of themselves cure almost any case within thirty-six hours. Two teaspoonfuls of pulverized charcoal, stirred in half a glass of water and drank, generally gives prompt relief.—*Journal of Health.*

Dangers from Impure Water.

Too much reliance is placed on the senses of taste, sight, and smell in determining the character of drinking water. It is a fact which has been repeatedly illustrated that water may be colorless, tasteless, and colorless, and yet be full of danger to those who use it. The recent outbreak of typhoid fever in Newburg, N. Y., is an example, having been caused by water which was clear and without taste or smell. It is also a fact that even a chemical analysis sometimes will fail to show a dangerous contamination of the water, and will always fail to detect the specific poison if the water is infected with discharges of an infectious nature. It is therefore urged that the source of the water supply should be kept free from all possible means of contamination by sewage. It is only in the knowledge of perfect cleanliness that safety is guaranteed.

The local European volunteer health commission in Alexandria, where the cholera has been raging along back, is unearthing, according to the *Sanitary News*, some very unsanitary conditions in that city. They have found a large native cemetery, underneath which runs a canal with which communicates a well, the water of which is used to wash dead bodies.

A drinking fountain adjoins this well, and the canal is the water supply of a crowded portion of the town. In the mosques are stagnant pools of water used for ablutions prescribed by religious belief, the water in which, being unchanged, gets indescribably foul. Such nuisances are difficult to abate, because of religious prejudices. Is it any wonder, adds the *News*, that pestilential disease attacks such a locality?

Precaution Against Consumption.

Dr. Arthur Ransome, in his Manchester Health Lectures, says:

Let me, then, urge again upon you the importance of thorough and sufficient ventilation of your living rooms. Avoid crowded omnibuses or railway-carriages in which the windows are closely shut, or in which the ventilation is so small that it does not prevent the condensation of vapor on the windows. Above all, do not frequent crowded meetings in which the organic exhalations are pent up within four walls. Remember, too, that the danger is especially great wherever there is a continuously high temperature. Professor Koch tells us that the limit of temperature within which the baccilus can be cultivated is from about 86 degrees to 107 degrees Fahr., about the heat of a hot summer's day. The continuously high temperatures in which formerly our consumptive patients were condemned to live was the very worst condition with which to surround them. Consumption is a much more rapidly fatal disease in hot than in cold climates, and it is probable that it is more truly infectious. The Indians treat it as if it were almost as infectious as scarlet fever or measles, and we must ascribe its less prevalence there to the almost open-air life the inhabitants lead. The evil practice of heaping upon the bed at night the clothes that have been worn in the daytime, or even as some do, of wearing the same underclothing day and night, is most pernicious, and likely to breed consumption in those who live in houses where this practice is pursued.

"Doctoring" Farm Animals.—It is poor practice to be continually dosing animals. When we see a farmer frequently visiting the drug store for medicine for his stock, the impression is that there is something radically wrong in his management. He is the "sick one," and needs the aid of a good physician—some one to show him that the sickness rarely happens on a well-ordered farm; that clean, warm stables and plenty of good feed, pure water in abundance, etc., are far better than their opposites, with all the physic that the largest drug store can supply. Nothing is more clearly proved than the importance of care and keeping of the right sort for the health of the farm animals and their profitable growth and increase. Sickness will sometimes come with the very best management; and when it does, it is better to employ skilled hands to cure, than to "doctor" and "physic," and perhaps kill the valuable animal yourself, which under proper treatment might have been saved at a trifling expense.—*Agriculture.*

MINING AND SCIENTIFIC PRESS.

Notice to Creditors—Estate of R. Greenwood, S. F.
Photo-Engraving—Crosscup & West, Philadelphia, Pa.
Information Wanted—Mrs. H. Erskine, Nevada City, Cal.
See Advertising Columns.

Passing Events.

The disastrous fire at Pittsburg which destroyed the exhibition building with its valuable contents, including the first locomotive ever run in the United States, was very greatly to be regretted. It will doubtless exercise an influence on future exhibitions, for possibly it will make people chary of allowing valuable and rare articles to be exhibited.

The first rains of the season have fallen since our last number went to press. The water fell over nearly the whole state.

The great debris suit is being argued in this city still, and miners are impatiently waiting for a decision on the subject.

There is little to note from the mines of late of any special moment. The current news we give elsewhere.

ACCORDING to Magee's *Real Estate Circular*, there were 181 sales of real estate in this city during September, aggregating $947,773. The same authority gives the number of mortgages during the same period at 170, amounting to $1,064,592, and of releases at 190, representing $1,138,989. The paper adds: "All of the savings banks report a glut of money with little or no demand. Rates are six per cent at the Hibernia, while all the rest of the savings banks are asking seven per cent."

THE Cannon Ball train on the Atchison, Topeka and Santa Fe road was attacked at Coolidge by a gang of cowboys Saturday. The engineer was killed and the fireman so badly injured that he will die.

THE Oroville *Register* gives currency to a report that Governor Stanford offered General Bidwell a million and a half for his Chico ranch, which was refused.

A New Reverberatory Furnace.

A reverberatory furnace for smelting purposes, which will burn liquid fuel has just been patented through the MINING and SCIENTIFIC PRESS PATENT AGENCY, by John H. Canavan, of Globe, Arizona. The floor of the furnace is preferably inclined and is made oval in shape. When fifteen feet long it would be 9 feet in the greatest width, and five feet wide at the front and four feet at the rear end. Around the sides is a boiler-iron water-jacket which extends up to the crown, or about two feet, while the remainder of the height (about three feet) is filled in with clay and coke-dust. Openings are left through the water jacket for slag-taps. The bottom may be of fine quartz or sand. Across the front are tuyeres which receive air from a wind box, supplied by a blower.

At the proper height are placed oil-tanks from which pipes lead down and have discharge pipes entering the tuyeres a short distance so as to deliver the oil at a point from which it may be carried into the furnace by the blast, thus producing an intense heat. The crown of the furnace is of asbestos or brick, and has two passages through which ore is fed into the furnace. This furnace is adapted for melting ores of copper, lead, and silver, and is operated as follows: The inside of the furnace is lined up from the bottom with common clay. About five bushels of charcoal are put in and fired. The blower is started and the oil turned on, and in a few minutes afterwards the charge is let down. In about three hours the clay lining will be destroyed, and its place taken by a coating of slag about half an inch thick all around the jacket, which prevents the chilling of the remainder of the contents of the furnace. The slag-tap opens into the furnace about two inches below the top of the water-jacket, and is kept open, so that slag will be running all the time when the furnace is in blast, there being a slag well on the outside.

The furnace will thus be kept full of slag to within two inches of the top, the charges of ore being let down at intervals into the molten slag and copper, there being added about five per cent of charcoal to deoxidize the metal. When sufficient metal has accumulated in the furnace, say 500 pounds, it may be drawn off into molds through the opening.

A furnace of the size described is capable, Mr. Canavan asserts, of reducing from 90 to 150 tons of ore in 24 hours. A main stop valve controls the flow of oil from the tank, and each tuyere has also a valve by which it may be cut off or regulated independent of the others. With this arrangement the heat in the furnace may be raised in a few minutes from 500 to 4,000 degrees.

This mode of supplying air and oil may also be supplied to brick furnaces by having the tuyeres and wind-box set on the outside of the brick, or it may be applied to melting or heating furnaces in copper or in rolling mills.

Hoisting Cables.

The cables commonly employed in the hoisting works of our deep mines are either flat ropes of steel or iron wire, or heavy round hemp rope, though the latter have been generally displaced for the metal. Chain is rarely used. Flat ropes were generally preferred, especially for great depths, because they possess greater strength in proportion to their size, winding themselves compactly on a reel and withstanding the wear and tear of the work well. They are usually from 3½ to 5 inches wide, and vary in thickness somewhat. If of iron wire they are from one-half to three quarters of an inch thick; if of steel, but three-eighths. The latter is preferred on account of its lighter weight and less bulk as well as great strength. Flat ropes are wound on narrow reels the width of which is but little greater than that of the rope. The latter therefore winds upon itself at each revolution of the wheel. The cable passes from the reel or drum over a sheave which is supported directly over the shaft, and thence downward into the mine. The sheaves are made of wood or iron of various dimensions Those of large diameter are preferred as they cause less wear and tear on the fibre of the cable.

THE City Council of Los Angeles has voted down the ordinance to license gambling by a unanimous vote.

Mining in Northern Arizona.

Since the completion of the Atlantic and Pacific railroad a new impetus has been given to mining in Northern Arizona, valuable lodes carrying high-grade ore have awaited its completion several years. Prior to the building of this railroad the want of rail or water transportation was much felt, the charges for carriage by available means being so high as to leave but a small margin to shippers, even on high-grade ores, and ores of average grade could not be mined and shipped except at a loss. This has been the cause of the backwardness in the development of this section, many owners preferring to let their property lie idle and wait for the Atlantic and Pacific railroad with its attendant lowering of rates on ore and supplies.

Many properties are now being brought into condition for the resumption of ore shipment. The holders of several of the large copper mines as well as the owners of high-grade silver-bearing veins along the line of the railroad will now avail themselves of the improved facilities.

The McCracken and Signal mines, of Owen's district, tried the experiment of reducing ore under the old expensive methods; but, while the mines produced several hundred thousand dollars, heavy expenses incident to their remoteness consumed what would, under the present conditions, have yielded large returns to the stockholders. The same experiment was tried on a smaller scale with the high-grade ores of the Arnold and the Hibernia mines of Cedar valley. Now that a handsome profit can be realized by mining and working, or by selling the ores, these properties are being put in shape for production, the latter mine having new life infused into it through the medium of Eastern capital.

Certainly nowhere in Arizona does a better field present itself than in this now accessible portion of the territory. The ledges are large, ores of high assay value, and wood and water abundant. But for the drawback before alluded to, the bullion product would have spoken for itself; and happily for the long-patient holders of the other mines, it is a thing of the past.

Institute of Mining Engineers.

The American Institute of Mining Engineers is a "live society," and its frequent meetings of late serve to bring out a great deal of valuable information in the possession of the members. Within the past few years more attention has been paid to mining outside of coal and iron, as the precious metal mining field has been more occupied by Eastern investors. We have published a number of the papers read before the Institute, and have others ready for publication.

The autumn meeting of the Institute will be held in Troy, N. Y., and will commence on Tuesday next, continuing four days. During that period they will visit the Clinton Stone Foundry, Rensselaer Merchant and Rail Mills, works of the Burden Iron Co., Albany Iron Works, Bessemer works of the Albany Co., the Hudson River Ore Co.'s property, etc.

The visits and excursions are only incidental to the business meetings. The papers read are published and sent to members, so that a great deal of information of value is disseminated. The following papers have been announced for the forthcoming meeting:

"The Law of the Apex," by Dr. R. W. Raymond, of New York. "Some Notes and Tests of an Open-hearth Steel Charge made for Boiler Plate," by A. E. Hunt, of Pittsburgh. "The Ste. Genevieve Copper Smelting Process," by Frank Nicholson, of Ste. Genevieve, Mo. "A Description of a Chemical Laboratory erected in 1863, as an adjunct to the Experimental Steel Works at Wyandotte, Michigan," by W. F. Durfee, of Bridgeport, Connecticut. "Some Canadian Iron Ores," by F. P. Dewey, of Washington, D. C. "Notes on an Experimental Working of Silver Ores by the Leaching Process," by J. H. Clemes, of Sonora, Mexico. "Determination of Manganese in Spiegel," by G. C. Stone, of Newark, N. J. "Pyrites of Louisa County, Va.," by W. H. Adams, of New York. "A Systematic Nomenclature for Minerals," by H. M. Howe, of Boston. "The Bessemer Plant of the North Chicago Rolling Mill Company at South Chicago," by R. Forsyth, of Chicago.

AN almost inexhaustible supply of water has been found by digging at Independence, on the Carson and Colorado Railroad.

The Cable Railroad System.

We have in preparation and will shortly publish, an elaborate description of the latest and most improved of our local cable railroads. A number of engravings now being made will serve to illustrate the whole subject very fully. We have been at considerable trouble to obtain all the details of construction of road, cars, machinery, etc., so that the description will be of utility to engineers. The Market-street cable railroad is the most complete of the kind in the world. In this city, where this system of street-car propulsion by underground cables was originated and has been fostered, we have had a great deal of experience, and all of this experience is combined in the new road, together with many improvements not before adopted.

The engravings which we have lately been giving in the PRESS, and those in preparation, are of a character to show that we endeavor to present in attractive form all the subjects which will interest our readers. The forthcoming edition will be very fully illustrated. It will be published as soon as the engravings are completed.

The cable railroad system is now rapidly extending. They have it in Chicago, and several other large Eastern cities will soon adopt it. All matter pertaining to the system is therefore of great interest. Our forthcoming description will be of such a character as will render it valuable for reference on the subject. The engravings will all be new, be well executed, and will include many details as well as general views.

Many persons are under the impression that all cable railroads are controlled by certain patentees, or rather that the general system is patented by some few persons. This is not so by any means. The patents so far granted are for many devices, and no one patent covers the idea of cable railroads. There are a dozen or more grips, for instance. All the patents in existence are for improvements on cable roads. Most of the railroads here are operated under the Hallidie patents. The Market-street railroad uses none of these, however, most of the improved appliances having been invented and patented by Henry Root, Superintendent of Construction of the road. An agreement exists between Mr. Root and the Market-street Railroad Company by which they have the use of all his patented devices and systems, and they hold license from no other persons.

The Water Balance.

There are some places where water-balance machines can be used for hoisting ore from mines. In many of the open works of the great coal basin of South Wales, water-balance machines are largely used for mining purposes, and for mines not more than 100 fathoms deep. In a district where there is plenty of water and free drainage they will work very well. Sometimes they are used where there is no drainage, the water being pumped up again by a pump, but this is of course not economical.

The car is placed in a cage over an empty water bucket, and the empty car on a similar bucket at the top. Water is then made to flow into the upper bucket until its weight is great enough to cause it to descend, so raising the loaded car. On the arrival of the full bucket at the bottom a self-acting valve opens, and the water is discharged, so allowing the process to be repeated. The buckets are made of half-inch boiler plates, circular in form, and hold about two tons of water. The landing chain is balanced by a chain which hangs below each bucket, and guide chains are used to keep the buckets from striking each other when the shafts are not divided. A speed of 300 or 400 feet per minute is easily attained by this machine. For great depths the weight of the machinery becomes so great that the apparatus is no longer economical. Machines somewhat similar in character are used in some of the iron mines of North Lancashire and Cumberland.

THE Creighton herding cattle ranch, the largest with the exception of the Swan outfit on the northern ranges, has been sold to the Bay State Live Cattle Company for over $700,000. The ranch and ranges are located near the line between Nebraska and Wyoming.

WITHIN a year the value of Oakland manufactures has risen from $2,798,000 to $4,654,500, and the number of employees has increased from 973 to 1,872 within the same period.

Earthquake Waves.

Although a number of earthquakes have occurred in California since it has been settled by Americans, none of them have been of such a character as to cause serious loss of life; and with none of them have we ever had a tidal wave. Where great earthquakes occur at or near a coast line, there is generally a resultant tidal wave of greater or less height. These waves do not necessarily occur at the moment of the shock, but may appear an hour or more afterwards. We have in this harbor an instrument for recording the height of waves, and its arrangement is such that it records earthquake waves also, and in such a manner that their presence is always detected, even when the earthquake occurs in South America, Japan, Java, or other places at great distance away. This self-recording gauge is maintained by the U. S. Coast and Geodetic Survey, and at the last meeting of the California Academy of Sciences Prof. George Davidson described its construction and operation, and exhibited diagrams of the markings.

The subject is one of considerable interest, and is one little understood by the general public. The gauge not only records the rise and fall of the tides, but the presence of unusual waves on the bar at the Golden Gate, as well as earthquake waves. A properly ruled sheet of paper is moved along by well regulated clock-work, so that about an inch of paper passes a given point in an hour. During this time a lead-pencil point impinges on the paper. This pencil is actuated by wheels connected with a peculiar float on the surface of the water. The pencil moves across the paper one inch to a rise of one foot of the sea. The box containing the float is so arranged that ordinary small waves do not affect the record of the pencil. At a point below the lowest level of the float there are holes in the box, to admit free movement of the water and give the level of the sea, regardless of small waves in the harbor or in the offing. When there is a heavy sea, part of the holes are closed.

There are some curious phenomena exhibited by this gauge, or rather brought to light by it, at the "slack" of each high and low water, depending on the characteristic of the entrance of a harbor. If an entrance is "throttled" or narrowed as it is in San Francisco, the incoming flood tide will have to force its way against an ebb running six knots an hour. To do this the young flood must come in along the bottom like a wedge and widen out. It must lift the whole outward moving mass over it. The recording pencil of the gauge shows this rise at the slack water. But this water wedge is soon overcome by the outgoing volume, and spreads out, so a slight fall then takes place. The pencil records this too. These changes occur at each high and low water.

There are tides which occur in this harbor where the fall from the "small high" to the "small low" is only about a foot, and sometimes even less; but a neap tide will run down to six or seven inches only.

Ordinary waves are not registered by the apparatus described. With a breaking bar, however, the gauge takes up the register, and in addition to the usual tide curve inscribed by the pencil, a serrated or "jigged" line is made, indicating this wave action. On the register this is very plainly marked. It will record the impulses of great breakers on the bar of San Francisco, and will also record impulses which have even a longer line of movement where the level is sustained for more than three minutes, so the float will be lifted.

As early as December 25, 1854, earthquake phenomena were recorded here, and waves were recorded constantly to the 1st of January following. There were no telegraphic or quick means of communication with the East or with South America or Japan in those days. The Coast Survey sent word to Washington about the disturbances, saying an earthquake must have occurred at some distance from here. It was not until the following June that this was corroborated. The waves rose 0.65 of a foot at San Francisco, and they were recorded also at San Diego and Astoria.

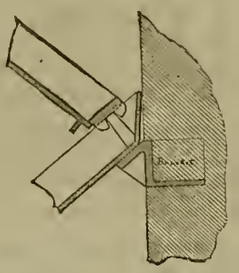
In 1868 the Arica (Peru) earthquake occurred, on which occasion the United States steamer *Wateree* was lifted by a wave forty feet high and carried far inland. These waves were propelled to these shores, and were recorded here. One was two and one-half feet high, but they averaged eighteen inches. They had to travel 4,500 nautical miles to reach San Francisco. The wave motion continued for six or seven days, though at Arica the tidal wave continued but seven hours. The only explanation of this is, that the waves carried across the Pacific were reverberated, and returned again several times before subsiding. The same wave would travel over to the Australian or Japanese coast, and come here from there again, crossing the ocean several times.

At the time of the earthquake at Arica there was no change in the surface of the water for 30 or 40 minutes, and then the great waves began to come and go. There were five great waves in the Simoda (Japan) earthquake of 1854, but seven or eight came to us here; so there must have been two reflex waves. So in Arica in 1868, the waves came here, one two feet high, and averaging one foot. They came at intervals of 35 minutes; and in addition to the main waves, inferior ones were recorded.

In 1877, while the gauge was smoothly recording the low water of May 10th, it began also to record earthquake waves from an earthquake at Iquique in South America. At the time of this great earthquake, at the Chincha Islands there was no motion of the water for some time; but late in the evening the water began to recede, and the people saw bottom where a short time before there were 100 feet of water. The wave on the main shore was 65 feet, so the center of the turbulance was off at sea somewhere. Our gauge here showed a rise of one foot. For several days there were waves, some as high as 17 inches, and some very well marked high crests. The interval between the crests of the waves was 45 to 50 minutes.

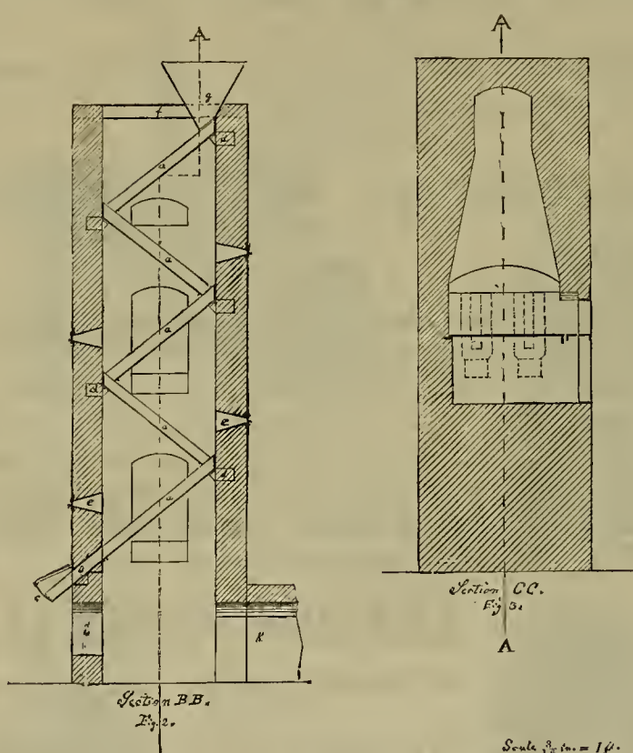
On the 27th of last August, at 2 A. M., the local gauge began to record earthquake waves. At noon the average height of the coming waves was about one foot. This motion continued for three days. The markings were, however, less characteristic than those of 1868 or 1877. The reason of this was, in a great measure, that so many obstacles intervened between this port and Java, where the earthquake occurred, the waves passing through narrow straits to get to the ocean. The distance from San Francisco, on great circle, to the northwest part of Java, where the center of the shock occurred, is 8,960 miles.

When the time of the original appearance of the wave at the central point is known, the average depth of the ocean between this point and that can be told. The rate of progress bears a certain relation to the depth of water. The Simoda earthquake waves had to travel 4,500 nautical miles, and they came in twelve hours and thirty-eight minutes. The velocity was 358 miles per hour, or 6 miles a minute.



Ariy has shown that in what is called the free ocean, where the water is 2,230 fathoms or more, a wave traveling that distance should reach this shore in the above time.

This agrees with the soundings made by Commander Belknap on the Tuscarora in 1873. There is a plateau of 2,200 fathoms deep running from this shore nearly to Japan, deepening somewhat as it nears that coast.



In the Arica earthquake of 1868 the wave ran 4,480 miles. It was attempted to deduce from its speed the depth of ocean, but several features presented themselves which prevented fair deductions. Thus the deduced depth to San Francisco was 1,800 fathoms, but it is known that the plateau is 2,200 fathoms.

From Ariea to San Diego the depth on the average is 2,713 fathoms. Coming north of San Fiego the change in the trend of the coast line and the interference of the Santa Barbara Islands acted as obstruction to free movement of the great wave, and thus retarded it. In a short time we will present graphical representations of these earthquake records, as well as those of the regular tidal waves; and of the breaking Bar waves.

San Joaquin county has accepted the offer of the Central Pacific Railroad to compromise the tax suits. The basis of the offer is the surrender to the said county of its bonds for $100,000, with accrued interest thereon, and the payment to the said county of $300,000 in gold coin.

Foundry Notes.

The San Francisco Brass Works.

Among our home industries which have made rapid progress of late is that of the manufacture of brass goods, and more especially those which are used by the plumbing trade. Until within a comparatively short time almost all the plumber's material has been imported for this coast. When Joseph Roylance started in, some eight years ago in a very small way to make his castings, without any capital at all, he had little idea that the branch he had undertaken would grow to such dimensions as it has since. After going along on a small scale for nearly eight years, William Moller joined the firm, and property was bought on Mission street, Nos. 413 and 415, and the original buildings, etc., were very much enlarged. After these two had run the business for a while, Robt. Dalziel, of Oakland, came over and consolidated the business, which then became a manufacturing and jobbing one.

The establishment is known as the San Francisco Brass Works, and has abundant capital, working from 90 to 100 men continually. They make all kinds of brass goods for plumbing and water works. They are the sole manufacturers in the United States of the "X" steam cock and globe valve. This is made of a metal far superior to any steam metal in the United States. They also manufacture the oxidized bronze, which is used for journals, being the hardest of metals. The Pacific Mail Steamship Company foundries, etc., use this and it is pronounced superior to phosphor bronze. There are only two other places in this country where they make this. They have just started this kind of manufacture here. A very large stock of iron pipe and pipe fitting, for water, gas and steam, are constantly on hand. Among other goods are sinks—black, enameled, galvanized and marbleized. Also, water closets, plumbers' earthenware, and in fact every article pertaining to a first-class plumbers' supply headquarters. A strong speciality is in iron pipes and fittings, it being the intention to keep the largest and best stock of these goods on the coast.

The establishment is quite a large one. The basement is filled to overflowing with the heavier goods, such as pipes, etc. The two-story building above has every inch of room occupied, and more space is so much wanted that a new and third story is shortly to be added. The lot is 40x160, covered with the building, and there is a foundry in the rear. The foundry is adapted to make three heats, or 210 boxes a day regularly. Up stairs, in the finishing room, are all the necessary appliances for finishing the various castings. Every article made is carefully tested, so as to stand certain pressure without leakage. The manufacturers can therefore guarantee all their work as perfect in every respect.

This is a home manufacture which is equal to any in the United States of its kind. The managers are practical men, and with the experience of Mr. T. W. Jeffress, who was for a number of years employed by W. W. Montague & Co., of this city, and who has a thorough knowledge and knows the wants of the trade on this coast, they can not but continue to succeed. The success which they have met with is proven by the gradual and constant increase of business, and necessity of enlargement of the works. No very large castings are made, the work being confined to that class of articles used in the plumbers' trade, such as cocks, valves, faucets, fittings, etc. They now keep all the supplies needed for first class plumbing stock.

Terrible Mining Work.—The upraise from the 2900 level has yet twenty feet to go to connect with the bottom of the winze down from the 2700 level. The rock continues bitterly hard; besides, it does not blast well, breaking short and blowing out in pot-holes. With all this a perfect torrent of hot water is constantly pouring down upon the men. It is difficult to conceive how they can work at all in such a place. They must go principally by the sense of touch—must feel their way like blind men. Not only is it impossible for the miners to look up, but such is the force of the pouring cascades of water that they can not climb the ladders without danger of being beaten off; and it has been found necessary to rig a hoisting apparatus by which to hoist the men up to their work. In no other place in the world could be found miners possessing sufficient nerve to work in such a place. The Burleigh drill is kept several feet ahead to guard against the sudden tapping of the water standing in the winze.—*Virginia Enterprise.*

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869, C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

Scientific Press

Patent Agency.

(ESTABLISHED 1850.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

THE ROLLER ORE FEEDER.

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

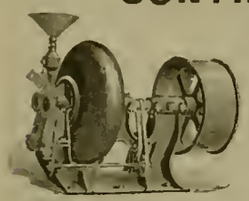
Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.
HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,760 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.



HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. R. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. **McCaskell's Patent Car Wheels and Axles—Best in Use.**

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. **New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.**

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, GOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanical in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

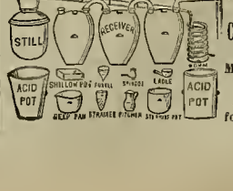
PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

"DUNCAN"

ROCK DRILL!

FOR MINES, QUARRIES, ETC.



J. CUYAS, Agent,

10 Park Place, - - New York.

RICHARD C. REMMEY, Agent,

Philadelphia Chemical Stoneware Manufactory,

1100 East Cumberland St., PHILADELPHIA, PA.

Manufacturer of all kinds of **Chemical Stoneware** —FOR— Manufacturing Chemists.

Also Chemical Bricks for Glover Tower.

Machinery at the Fair.

While the display in the mechanical department of the Mechanics' Institute Fair, now in progress in this city, should have been much larger, in view of the many foundries, machine shops and factories in this community, there are yet a number of things to interest one, and several of the displays are very creditable. Mining machinery is by no means plentiful, for instance, yet we make plenty of it, and of all kinds in this city. Among the mechanical appliances of mining on exhibition is

Tustin's Ore Mill,

A machine which we described and illustrated not long since. Mr. Tustin shows his mill in operation, so that any one can see how it works, and the result. He is just shipping one of these machines to the Oro Plata milling company, at Murphys, Calaveras county. They had one of the small ones a long time, and then purchased three of the large ones. These have given entire satisfaction, and a few weeks ago they ordered another large one. They say they have no more use for stamps. The stamps "slime" up to forty-eight per cent, and the pulverizer makes only about six per cent of slime, which makes the difference between success and failure in their operations. They own a ten-stamp battery, which, however, they have hung up. Mr. Tustin has made some improvements on this pulverizer lately. By a simple means of regulating the throw of the feeding apparatus, the rate of feed can be ganged to the utmost nicety. The machine is quite a strong and durable one. Mr. Tustin also exhibits a small rock-breaker, which is made to be sold at a low price, but is simple and strong in construction. It has the rubbing and crushing motion, both so essential in these machines. The Joshua Hend. Machine Works exhibit

A Triumph Concentrator.

This machine we recently described, and mentioned the new features which have been combined with it. The manufacturers inform us that one is now being put into the Empire mill, at Grass Valley, where there will be a competitive trial of this with two other prominent forms of concentrators. The mill is being remodeled, and the owners will put in the best machines. Several of these concentrators have been ordered lately for Arizona and New Mexico. The improvements recently added to this machine very materially add to its efficiency.

The Ohmen Engine.

The display made by the manufacturers of the Ohmen engines is quite creditable. Twelve different engines are shown, from four inches up to twelve inches; some upright and others horizontal, and some with plain slide valves and others with the Meyers cut-off. One of the engines has a new automatic cut-off, a patent for which has been filed. The makers claim the new engine will work as economically as the Wheelock or Corliss.

The ore which has been tested has answered every expectation, and is a grand success. There are few parts to wear out. Mr. W. H. Ohmen and his foreman, J. Simmons, are the designers of the new style engine. The slide valve and Meyers cut-off engine made by Mr. Ohmen are very strong indeed, and will stand rough usage. They are made as strong as possible to accommodate the requirements of this market. The hoisting engine exhibited is the same type as one they have running over at the new wharf of the South Pacific Coast Railroad Company. There are different kinds there, and the engineer tells Mr. Ohmen that his does the best work. There is a small horizontal engine running the four electric lights outside the pavilion. It was furnished free to run lights during the fair.

These works were started in this town about six years ago, with a capital of $600. They would not sell out now for $100,000. They carry a stock of some $35,000, and have a very good and increasing business. They show as much advance as any machine shop in this city ever did. The types of engine made have given good satisfaction.

The Dyer Cannon-Ball Quartz Mill

Is a machine patented about a year ago, and not long since described in the PRESS. An engraving of it appears now in an advertisement in another column. It is simple, compact and strong, and has no complicated machinery to get out of order; the wearing parts are cheaply and easily renewed. Its movement is rotary, crushing (not grinding) either wet or dry equally well, and running in either direction. Will crush according to power used; readily geared for steam, water or horse-power, and can be run by hurdy-gurdy wheel on pinion shaft, which is a favorite method. Occupies but little space. Is quickly set up and removed, and can be placed on any sidehill where there is ten feet of level ground. It will take good sized quartz, dispensing with rock-breaker where it is an object and necessary. It leaves the gold bright and easy to amalgamate, and can be cleaned up in a few minutes. The discharge is ample, and but little wear on the screen, no coarse quartz coming in contact with it. The machine is adapted to either upright or flat screen, as desired, or according to the work required to be done. The cost of the frame is very little, and it can be constructed by any one at the place where used, thereby saving freight and packing.

This machine is made at the Globe Iron Works, in this city. The one exhibited at the fair will crush a ton a day with a No. 40 screen, It weighs twenty-five tons, and will crush wet or dry. One of these machines is at work in the Tom Greene mine, in Shasta County; one in the Drury mine, Placer County; three at Grizzly Flat, Eldorado County; one at Grass Valley, and one at Gold Hill, Nev. One just built is ready to ship now. It is a three-ton machine, and will be run by horse-power. It is going to a mine owned by Chas. Daily, Madera, Fresno County.

Baker's Mining Horse-Power.

This machine, made here by the Pacific Iron Works, we illustrated a short time ago. One of them is exhibited in the fair. The machine is made entirely of iron, and is therefore very durable, and will not be affected by exposure in dry or wet climates. The hoisting drum is completely under the control of the man at the shaft landing the bucket by operating the levers at hand, and by which means the drum can be thrown in and out of gear at will, or the bucket lowered by the brakes as safely and conveniently as by a steam-power hoist. The brake and clutch levers are provided with spring latch and quadrant, giving the man in charge freedom of movement when the brake is operated, and locking it so firmly as to prevent the possibility of accident. The drum will carry 500 feet of five-eighths steel rope, and, running horizontally, will take up and pay out without friction. The drum working independently, a pulley may be put on the end of the drum shaft (which has a projection for this purpose) and connected by a belt to a crank shaft on gallows frame, by which a pump or blower may be run continuously, without interfering with the hoist, as the drum clutch can be thrown in and out of gear while running—an invaluable attachment, and embraced in no other hoist of the kind. This machine will hoist fast. At the ordinary speed of a horse, a 1,000-pound bucket of ore or water can be raised at the rate of 120 feet per minute. Two horses can be used for heavy work, in which case an extra sweep will be required. It is a very light and compact machine; no piece weighs more than 250 pounds, thus admitting of its being packed on mules to all inaccessible localities. The cost of erection is very little, two men in half a day being able to put it in place, ready for work.

Beckett's Engine.

Mr. F. G. Beckett, manufacturer of vertical and horizontal engines and boilers, shows several of the types of his make. The vertical engines and boiler are connected together on a substantial iron base, occupying little space; may be easily mounted upon wheels, rendering them well adapted for agricultural purposes, or can be placed with perfect safety on a boarded floor, the insurance companies making no extra charge for their use. They are very simple in their construction, and easily managed, and can be run with safety by persons of ordinary intelligence. The combined engines and boiler (except the two, three, and four horse-power) are all supplied with heaters, through which the feed-water, by contact with the exhaust steam, passes to the boiler at a boiling point, making a large saving in fuel. The working parts, such as piston rod, valve rod, crosshead pin, etc., are made of steel; the bearings are made of extra length. The crosshead is fitted with brass gibs, having a very large area of wearing surface, being more than two thirds of the stroke of piston. The vale rods work in substantial guides; the balance wheels are of ample size and weight, and turned true for driving belt. Mr. Beckett has one 10x12 engine of twenty horse-power running the saw mill in the fair. He has also one seven-inch engine of twelve horse-power running the turbine pump for irrigating, lifting 100,000 gallons of water an hour. Another one of his engines of five horse-power is running the S. F. Tool Company's blower for blowing air into mines or furnaces. Mr. Beckett is now engaged in making a seventy horse-power horizontal engine, fourteen-inch cylinder, for a flour mill. These engines are well built in a substantial manner. The manufacturer is making a number of them of various sizes.

The Roller Ore Feeder,

Made by the Golden State and Miners' Iron Works, was illustrated in the PRESS in November of last year. The roller which delivers the ore to the battery is placed at the mouth of the chute leading from the hopper, to which it acts as a gate. When the roller is at rest the ore remains in the chute, but on its slightest forward movement a portion of the ore is forced into the battery. The chute is constructed to deliver the ore on top of the rollers in a manner analagous to the way water is applied to an overshot water wheel, and if the flow of ore were constant the rollers would be rotated by it as the water wheel is driven by water. Owing to the slight movement of the roller required to deliver the ore, a very small amount of power is required, not detracting from the efficiency of the stamps that operate it. The delivery is readily regulated. The feeders will feed the ore to any desired number of stamps according to the length of the rollers.

Blasting in Mines - No. 10.

Removing the Dislodged Rock.

As the removal of the rock brought down by the blast consumes a large proportion of the time saved by machine boring, it becomes necessary to provide means for reducing this loss to a minimum. The most important of these means consists in a suitable provision for the rapid removal of the machine to a place of safety, and a conveniently designed and well-laid tramway upon which the rock may be quickly run out without confusion, and its consequent delay. The tubs should be of such dimensions as to be handled without great difficulty. The importance of this condition will be understood when the frequency of derailments is borne in mind. The shoveling up of the rubbish is greatly facilitated by laying iron plates in front of the face to be brought down previously to the firing of the blast. This expedient is generally adopted in important drivings. It has also been remarked that the dislodged rock can be more rapidly removed when it exists in small blocks. Thus there will be an advantage in placing the charges and in regulating their strength so as to completely break up the rock. Another matter of importance in the arrangements for the rapid removal of the rock brought down by the blast is the proportioning of the number of hands employed to the requirements of the case. This number will increase with the size of the blocks to be lifted, the distance to be run over, and the want of suitability in the *material* employed.

Division of Labor.

A proper division of labor is greatly conducive to rapid and economical progress. Andre, in his treatise on "Coal Mining," from which we take these facts, says that the operations may be divided into three series, namely, boring the shot-holes, charging and firing, and removing the rock dislodged. Each of these series of operations may be performed by different sets of men, and in several instances this division of labor has been adopted. But it does not appear that such a division leads to the most satisfactory results. The work of boring occupies a much longer time than either of the other two series of operations, and hence the distribution of the time is unequal. It has been found that, generally, where all the arrangements have been well considered, the labor of charging the shot-holes, firing the blast, and removing the rock brought down can be performed in about the same time as that of boring. Thus it would seem to be more conducive to economy of time to divide the men employed into only two sets: one set to bore the holes, the other to perform all the subsequent operations. This division has been adopted in numerous instances with favorable results. Sometimes the whole of the operations have been performed by the same set; but such an arrangement is not to be recommended. The labor of driving the machines is of too distinct and skilled a character to be confounded with that of blasting the rock and removing the debris without a strong reason for such a proceeding, which does not appear to exist. Besides reserving a set of men specially for this portion of the work, it is desirable to keep the same men to the same machine; for in such a case each man gets accustomed to the peculiarities of the machine entrusted to him, and besides conceives a kind of affection for it that leads to careful handling and watchful attention. In addition to the men required for the operations referred to above, smiths will be needed to resharpen the bits and to repair the machines. The amount of this labor will obviously depend upon the number of machines employed, and the hardness of the rock to be passed through.

California Kaolin Deposits.

The recent discovery of an immense deposit of kaolin (the finest china clay—used principally in the manufacture of porcelain, and proceeding from the decomposition of mineral feldspar) in the vicinity of Rush creek, two miles west of this city, appears now to have been a more important development than was at first imagined by the most enthusiastic of the locators. Numerous authorities at San Francisco and the East have been consulted as to the quality of the material, and the returns so far received all go to indicate that it is of a high grade and fully adapted to the uses required of it. A fear had prevailed here that the deposit would prove useless without the discovery of an accompanying bed of fire-clay, from which to make the seggars or cylindrical cases in which the ware is baked, but this, upon investigation, proves to have been a mistake, as the kaolin itself can be and often is used for that purpose. Undecomposed feldspar, also used largely in connection with kaolin in the making of ware, abounds throughout this immediate locality in large quantities; fuel is abundant, and in fact all the conditions look favorable for an early establishment of large potteries in this township, especially as men experienced in the business and with plenty of capital announce their readiness to embark in the enterprise as soon as they become thoroughly satisfied about the extent and quality of the clay. With such an industry started successfully, steady employment would be given to many people at fair wages, and the help of boys and girls would be in constant demand, as is always the case where potteries exist.

The Nevada City Company, whose location embraces 160 acres, have been at work a week and have from 20 to 30 acres of the bed uncovered. This task is made easy from the fact that in early days the placer miners washed over the surface of that whole section in their search for gold, which search was richly rewarded, by the way,—and only a comparatively thin layer of gravel and bowlders was left behind. The company have sunk down to a depth of about ten feet in several places, and find steady improvement in point of purity as they descend. They believe the deposit to be very deep, and propose to thoroughly prospect it at once by means of shafts, etc.

The Nevada County Company, owning the adjoining claim, also have 160 acres, and equally as good prospects. They will shortly have their ground thoroughly explored.

Capt. Moore, Superintendent of the Nevada City Company, and formerly a worker in English potteries, says he can readily extract and clarify twenty tons a day. In 1865 he secured a patent on a machine that greatly facilitates the purifying process.—*Nevada Transcript.*

IT is expected that next year will see a very large immigration into California, and that, too, of the very best class of people. It is reported that a very lively interest in this State has been excited in the Western and Northwestern States, and that men of means and prominence have begun to look to California as a home.

THE day car of the Southern Pacific Railroad passed through Fresno on Thurday with about $700,000 on board, which will be paid out between that place and New Orleans.

ALL iron preparations blacken the teeth, constipate the bowels, and give headache, with one exception, that is Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING SEPTEMBER 25, 1883.

285,541.—AGRICULTURAL BOILER—S. N. Mford, Portland, Or.

285,462.—REVERBERATORY FURNACE—J. H. Canavan, Globe, A. T.

285,463.—PLOW—Jas. Clausen, San Luis Obispo, Cal.

285,495.—LUBRICATOR—M. L. Conway, S. F.

285,710.—FIRE ESCAPE—F. C. Eal, Jefferson City, M. T.

285,481.—MOLD BOARD FOR SIDE HILL PLOWS—Paul Gregory, Davenport's Landing, Cal.

285,187.—APPARATUS FOR REMOVING SAND BARS—J. H. Huller, Jacksonville, Or.

285,753.—NASAL INHALER AND INVIGORATOR—Jas. Keck, Portland, Or.

285,755.—SAMPLE EXHIBITOR FOR WALL PAPERS—Jas. F. Kidd, Stockton, Cal.

285,757.—SLATE PENCIL SHARPENER—W. P. Kirkland, S. F.

285,422.—THRASHING AND CLOVER HULLING MACHINE—A. W. Lockhart, Sacramento, Cal.

285,495.—CHECK BOX—David Lubin, Sacramento, Cal.

285,499.—STATION INDICATOR—Thos. Melrose, S. F.

285,508.—AMALGAMATING ORES AND SAND CONTAINING GOLD—A. B. Paul, S. F.

285,514.—CABLE RAILWAY—Henry Root, S. F.

285,520.—APPARATUS FOR EXTINGUISHING FIRES ON VESSELS—A. F. Spawn, Oakland, Cal.

285,702.—SANDBOARD FOR RAILWAY—T. W. Stapleton, Portland, Or.

285,530.—COMBINED CANE AND FAN—Wm. Verbeck, S. F.

285,720.—HEADER—Jos. H. Winn, S. F.

285,601.—LEVEL SQUARE—M. Farley, Portland, Or.

10,606.—TRADE MARK—J. R. Williams, Stockton, Cal.

3,547.—LABEL—M. A. Scott, Livermore, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

MOLD BOARD FOR SIDE-HILL PLOWS.—Paul Gregory, Davenport's Landing, Santa Cruz county. No. 285,481. Dated September 25, 1883. The mold boards of plows designed for level land have long since been found unsuitable for side-hill work, and a straight mold board which was tried was found undesirable because of its rear end, which was left straight, cutting the sod already thrown out. To remedy this a convex mold board was adopted with a slightly curved or rounded rear edge, under the impression, which still prevails, that it would not only pass over the thrown-out sod without cutting it, but would throw the sod out of the furrow to the best advantage. Side-hill plows now used have this convex mold board, though lately there appears a tendency to return to the straight mold board with a rounded rear end, as being better. Mr. Gregory finds objections to both forms. The object of his invention is to provide a mold board for this class of plows which shall turn the earth out of the furrow to one side, to the best advantage both as regards the completion of the throw and the progress of the plow, with the least hindrances. To this end his invention consists in a mold board having a laterally concave face, its rear edges being rounded (or convex) to a point to avoid cutting the sod.

CHECK BOX.—David Lubin, assignor of one-half to Harris Weinstock, both of Sacramento. No. 285,495. Dated Sept. 25, 1883. This apparatus is specially designed for the use of cashiers in stores where the salesmen use slips or checks upon which are written the amount of each sale as made, and which are transmitted to the cashier; or it may be used for tallying grain or other articles belonging to different owners which may be shipped all together, or for other similar purposes, as in brokers' accounts, and for voting or election purposes, etc., the results being only accessible to the proprietor, confidential clerk, or those whose duty it is to examine, and who have the key.

HEADER.—James H. Winn, Benicia, Solano county, assignor to Baker & Hamilton, S. F. No. 285,720. Dated Sept. 25, 1883. The invention consists in the peculiar arrangement of a compensating spring, executive pulley, and beam. In lowering the front the tendency of the header to go down is resisted by the spring, and the stronger the tendency the greater the resisting power of the spring. The beam is made in two pieces, and is strong, light, and will not warp. The details of construction of this machine are the main improvements.

PLOW.—James Clansen, San Luis Obispo. No. 285,463. Dated Sept. 25, 1883. The invention is especially applicable to plows which are designed to be used in heavy or sticky soil, to enable them to scour or clean themselves. It consists of a high-arched beam having a vertically and horizontally adjustable clevis, and a mold board formed of independent strips diverging upward and backward from the share, so as to leave openings between them. Each strip is braced so as to stiffen it, and the land side is also made very narrow.

APPARATUS FOR REMOVING SAND-BARS.—John H. Huller, Jacksonville, Jackson Co., Oregon. No. 285,487. Dated, Sept. 25, 1883. This invention relates to certain improvements in apparatus for removing sand-bars or similar deposits at the mouths of rivers or harbors, and it consists of a receiver or chamber, of sufficient diameter to rest upon the bottom, provided with jet nozzles through which water is forcibly ejected against the bottom, so as to wear it away. The receiver is connected with the vessel or boat carrying the pumps and machinery by a flexible tube, through which the water passes from the pumps, and the tube is provided with bands surrounding it at intervals. These bands have eyes at each side through which wire ropes or chains pass from the boat to the receiver, and hold them together without strain on the tube.

LUBRICATOR.—Michael L. Conway, S. F. No. 285,465. Dated Sept. 25, 1883. This lubricator consists of a novel combination and arrangement of parts by which different parts of a machine may be lubricated from a single oil vessel. The object is to provide a simple, effective and steadily operating lubricator for steam engines.

COMBINED CANE AND FAN.—Wm. Vorbeck, S. F. No. 285,530. Dated Sept. 25, 1883. This is a fan combined with a cane or parasol-handle, so that the fan can be drawn out for use at any time, and when not in use lies concealed.

News in Brief.

THE rains have stopped the mountain fires.

TWENTY-TWO Omaha Indians have been taken to the Exposition at Paris.

BUSINESS at Canton is entirely suspended, owing to the unsettled condition of affairs.

THE first-class passenger rate from Kansas City or Omaha to San Francisco has been reduced to $95.

STOCKTON licenses liquor dealers at $15 per quarter, and has fixed the county and state tax at one per cent.

SEVERAL hundred cords of wood have been seized at Clinton, Mono county, by United States timber agents.

THE United States sloop-of-war *Yantic*, from St. John's, N. F., arrived in New York Saturday, bringing the survivors of the *Proteus*. All were well.

THE Omaha Board of Education has decided to try the experiment of the kindergarten system in some of the lower grades of the Omaha public schools.

THE steamer *Newbern*, from Mexico, is quarantined in San Francisco bay with five cases of yellow fever aboard. All but one of the patients are convalescent.

A TRUE iron medicine, beneficial to the young as well as the old, who suffer from dyspepsia, etc., is Brown's Iron Bitters.

INFORMATION WANTED.—Information is wanted of Wm. Erskine, who has been living near Hailey, Alturas county, Idaho Territory, for two years past. His wife has not heard from him since last Spring. He was President of the Miners' Union of Silver City, Idaho, five or six years ago. Any news of him would be thankfully received by Mrs. Hannah Erskine, of Nevada City, Cal., or R. H. McDonald, Los Angeles, Cal.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

NOTICE TO CREDITORS.

ESTATE OF ROSEMOND GREENWOOD deceased.—Notice is hereby given by the undersigned, executor and executrix of the last will and testament of Rosemond Greenwood, deceased, to the creditors of, and all persons having claims against the said deceased, to exhibit them with the necessary vouchers, within four (4) months after the first publication of this notice, to the said executor and executrix, at the office of E. W. Blancy, Esq., attorney-at-law, No. 526 Montgomery Street, the same being the place for the transaction of the business of said estate, in the City and County of San Francisco.

Dated at San Francisco, the 2d day of October, 1883.

GEORGE SPAULDING,
MARY WILLIAMS,
Executor and Executrix of the last Will and Testament of ROSEMOND GREENWOOD, deceased.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and parties who are in need of such an appliance for a small mill will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to Heald's office.

FINE WOOD PHOTO-ENGRAVING
SEND COPY FOR ESTIMATE. IT WILL PAY YOU
CROSSCUP & WEST.
702 CHESTNUT ST. PHILA. PA.

PLAIN TRUTHS

The blood is the foundation of life, it circulates through every part of the body, and unless it is pure and rich, good health is impossible. If disease has entered the system the *only* sure and quick way to drive it out is to purify and enrich the blood.

These simple facts are well known, and the highest medical authorities agree that *nothing* but iron will restore the blood to its natural condition; and also that all the iron preparations hitherto made blacken the teeth, cause headache, and are otherwise injurious.

BROWN'S IRON BITTERS will thoroughly and quickly assimilate with the blood, purifying and strengthening it, and thus drive disease from any part of the system, and it will *not* blacken the teeth, cause headache or constipation, and is positively *not* injurious.

Saved his Child.

17 N. Eutaw St., Baltimore, Md.
Feb. 12, 1880.

Gents:—Upon the recommendation of a friend I tried BROWN'S IRON BITTERS as a tonic and restorative for my daughter, whom I was thoroughly convinced was wasting away with Consumption. Having lost three daughters by the terrible disease, under the care of eminent physicians, I was loth to believe that anything could arrest the progress of the disease, but, to my great surprise, before my daughter had taken one bottle of BROWN'S IRON BITTERS, she began to mend and now is quite restored to former health. A fifth daughter began to show signs of Consumption, and when the physician was consulted he quickly said "Tonics were required;" and when informed that the elder sister was taking BROWN'S IRON BITTERS, responded "that is a good tonic, take it."

ADORAM PHELPS.

BROWN'S IRON BITTERS effectually cures Dyspepsia, Indigestion and Weakness, and renders the greatest relief and benefit to persons suffering from such wasting diseases as Consumption, Kidney Complaints, etc.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

No. 252 Market St. Elevator, 12 Frout St., S. F. Telephone No. 658.

DEWEY & CO., Patent Agents.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California. location of works, Dry town, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 27th day of September, 1883, an assessment (No. 1) of ten cents (10c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 528 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1883, will be delinquent, and advertised for sale, at public auction, and unless payment is made before, will be sold on Monday, the 19th day of November, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. MARTIN, Secretary.

OFFICE—Room 6, No. 528 California Street, San Francisco, California.

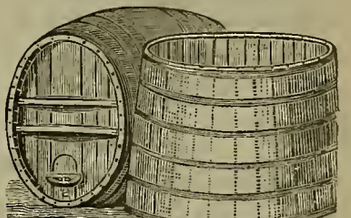
JET PUMPS.

THE CHEAPEST AND BEST
STEAM PUMP for Lifts from 10 to 70 ft.
FOR IRRIGATING PURPOSES

And all General Work where a Simple, Durable Pump is Required.

NO VALVES! NO PISTON!
NO OIL REQUIRED!

Can be Run by a Child.



EACH PUMP GUARANTEED.

PRICE—One-tenth of an ordinary Steam Pump, same capacity.

Call and See One in Actual Operation.

Edward A. Rix,
Sole Agent.
18 and 20 Fremont Street, San Francisco.

California Wine Cooperage Co.,

FULDA BROS., Proprietors,

STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

BAKER'S MINING HORSE POWER.

THE MOST EFFICIENT AND PRACTICAL MACHINE ever invented for the service of Prospectors and others requiring the use of a Horse Power; possessing all the requirements of a first-class hoist and affording means for the continuous operation of a Pump or Blower without interfering with a hoisting apparatus.
It is made entirely of Iron; no piece weighs over 250 pounds. At the ordinary speed of a horse a 1,000-pound bucket of ore may be raised 120 feet per minute. The hoisting drum is under the complete control of the man at the shaft, and is capable of carrying 500 feet of five-eighths steel rope. The cost of erection is slight, as two men in half a day can easily put it in place ready for work.
While this power is more particularly for mining purposes, it is equally adapted to all other uses where animal power is required. SEND FOR CIRCULAR. Address

IMPROVED FORM

—OF—

HYDRAULIC GIANT

We call the attention of those using or interested in Hydraulic Mining Machinery to the above cut of an improved form of Hydraulic Giant, in which it will be observed that the Deflector and heavy weighting rear part are abolished and a lever attachment, working with a ratchet and pawl substituted, by which the pipeman, standing in the rear of the machine, has, without danger of "bucking," full control of the direction and effect of the stream. In an action in the U. S. Circuit Court, entitled F. H. Fisher and Joshua Hendy vs. Richard Hoskins et al. of the Marysville Foundry, a permanent injunction has recently been ordered against all persons manufacturing or using any form of Hydraulic Machine having the equivalents of the above.

All of the usual sizes are manufactured (under an exclusive right) and for sale at reduced prices by JOSHUA HENDY, at the

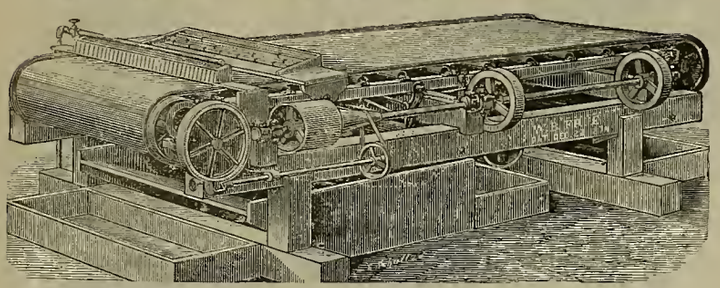
AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.



Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company.

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, OCTOBER 13, 1883.

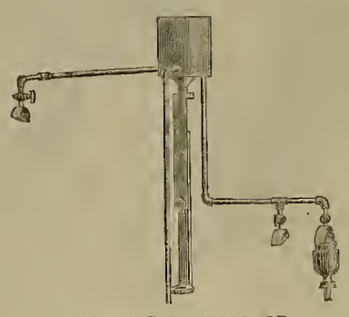
VOLUME XLVII Number 15.

A New Virgularian Zoophyte.

Recent pages of the proceedings of the United States National Museum contain a description of a new compound polyp, belonging to the group known to science as *Virgularia* (from virgula, a little rod), which consists of a central slender stalk, or axis, which looks, when free from the exterior or investing mass of polyps, very much like a peeled willow switch, or wand. This, when the animal is alive, is covered with a semi-translucent, fleshy or jelly-like substance, rather firmer than ordinary jelly, and usually of a pinkish color. Upon examination it will be seen that this fleshy substance, or sarcode, as it is called, is a perfectly organized animal form, compounded of many small forms, each resembling a sea-anemone, the edge of the mouth or oval opening in each being fringed with eight delicate feelers or tentacula; and these tiny living sea-flowers are in different species arranged along the length of the rod, sometimes in rows crosswise like so many letter v's, (∧∧∧∧∧) and again one over another, not in cross rows, but singly, like this (≺≺≺≺), up and down the stalk; and again wound somewhat spirally around the central rod or axis; sometimes, also, in double and treble rows lengthwise of the rod, which looks like a long, slender stem with living flowers on each side.

In the great virgularian described about ten years ago by Dr. R. E. C. Stearns * the stock is sometimes eight feet long, and its surface often exhibits as many as 250 V-shaped rows of polyps, aggregating over 5,000 in the entire colony or animal. Each one of these tiny animal flowers is fixed and stationary in its place in the row or on the stalk, and forms a part of this wonderful compound animal, which, as a whole, has duets and circulatory arrangements running throughout its entire length, and probably connecting with each one of the five thousand; and the food secured by either one of the numerous small polyps helps to nourish the whole mass. The stalk or axis, which as before remarked looks like a slender peeled willow switch, tapers at each end, and is the only hard portion, and when dry is somewhat like bone in texture. The form referred to as a new species is found in Japanese waters, and is sometimes three feet long, with a row of polyps arranged in a single series, one above another along one edge of the rod, which is obtusely quadrangular in cross-section. Its most striking peculiarity, as particularly pointed out by Dr. Stearns, who is also the describer of this, is that the lower end of the stalk or axis, instead of being simply tapering, has a fork-shaped root of several irregular prongs, showing that it is sedentary in its habits and permanently fixed or attached to the rocks at the bottom of the sea, and not able to move about at times as can the other species, which, when not floating, have the lower or basal end in the mud or sand of the sea-bed, and stand in an upright position like rushes, which has caused them to be sometimes known as sea-rushes.

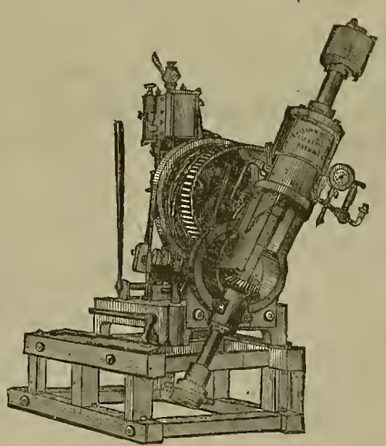
This new form with the root-shaped base is particularly interesting, as it connects the sea-rushes or virgularians with the *Gorgonia* or sea-fans.



The President has accepted two sections of the Northern Pacific—one of 50 miles in Montana, and the other of 36 on the Columbia River to Portland, Oregon.

---

* Haliptera Blakei.



An Improved Lubricator.

On the main engine at the Mechanics' Institute Fair is a peculiar lubricator, recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, by Michael Conway of this city. An engraving of this new device is shown on this page. A large oil-reservoir, of any suitable pattern, is mounted on a standard and filled with oil. Tubes or small pipes connected with this extend to points where a supply of lubricant is needed. Upon the ends of these pipes or tubes are secured small arms, between and to the ends of which is received a strip of lampwick, with sides turned up to form a sort of trough to receive the dripping oil.

CONWAY'S LUBRICATOR.

The end of each of the small distributing pipes is open, or rather has a cock to regulate the flow of oil from it. As the oil drops from the ends of these pipes it falls on to the strips of lampwick, which thus become saturated with the oil. As this lubricator is intended mainly to supply oil at such points of an engine as the eccentrics, wrist-pins and main journals, at each of these points is screwed, in the usual manner, the cup for oiling the journal. This cup is provided with a diametrical blade or scraper of thin metal, the upper edge of which projects slightly above the rim of the cup, while its lower portion extends down within the cup some distance. This cup, with its scraper, is a brass casting, all in one piece.

A NEW PROSPECTING MACHINE.

In the revolution of the machinery the brass oil-cup comes in such close proximity to the saturated fabric that its scraper passes along the under surface of the oil-saturated lampwick, and scrapes the surplus oil from it, which then passes down the scraper into and through the cup to the journal.

The strip of lampwick may be renewed when required, its small cost and the facility of adjusting a fresh strip rendering the operation practicable. The supply of oil is certain and regular. The supply of oil to the cups may be very nicely regulated by means of the cocks at the ends of the pipes or tubes.

It is intended that the different parts of the engine may be lubricated from a single oil vessel, oil tubes with wicks being provided to extend to the different bearings needing lubrication.

Messrs. John Broderick and John A. Hamilton, both of this city, are interested in this invention with Mr. Conway. The Fulton foundry (Hinckley, Spiers & Hayes), 220 Fremont street, manufactures these lubricators.

International Electrical Exhibition.

It is announced that an exhibition of electrical appliances, is to be held in Philadelphia, commencing Tuesday, Sept. 2d, 1884, under the auspices of the Franklin Institute. From the eminent reputation of this institution, coupled with the fact that the projected exhibition will be the first in America exclusively devoted to this important and progressing branch of science, the above announcement has attracted unusual interest throughout the United States, and the exhibition will undoubtedly afford an admirable opportunity of witnessing a representative display of American discovery and invention in electricity. To increase its scientific and industrial importance, as well as to add to its attractiveness, it was determined shortly after its inception to give it an international character. The importance of the project having been properly represented to Congress, an act was passed which, having received the signature of the President, is now the law. This official recognition provides for the admission into the United States, duty free, of all articles for exhibition only.

The subject of electricity and its application is now attracting unusual attention, and the exhibition, side by side, of the best achievements of both America and Europe, can not fail to be in the highest degree instructive. The Franklin Institute will endeavor to secure a large representation of the progress of foreign countries, and the most liberal provisions will be made to place European and American exhibitions on a fair and equal footing.

The electrical exhibitions held in Europe of late, have attracted great attention. The progress in this branch has been so marked within the past few years, that a very large number of new appliances have been invented and perfected. Our own country has many workers in electrical science, and we ought to make an exhibit which will compare favorably with the efforts of older countries. This exhibition is sure to be an interesting one, the results of which will be of benefit to the public.

The National Association of Window Glass Workers at Pittsburg, now engaged in a strike against a reduction, have formed a combination with $1,000,000 capital, for the purpose of entering into manufactures in opposition to their late employers.

A New Prospecting Machine.

The Sullivan prospecting machine is illustrated by an engraving on this page. It is a diamond core drill, simple in construction, and of great strength and lightness. There is a single hydraulic cylinder with the drill rod carried up through the piston rod instead of the two cylinders with drill rod outside. By this improved hydraulic feed the speed of the feed is governed by the resistance met with; while the diamond head and the lengths of tubing are not liable to be torn to pieces by the sudden intervening of hard substances. The pressure is indicated by a gauge.

The machine is set on a low spring frame with a geared track, so that when the drill rods with the core are to be raised the machine is run back out of the way by a simple device, and the rod is attached to the hoisting rope and steam windlass. These are driven by the same engine which at other times revolves the drill. The pipe is lowered by the help of the same windlass, an ingenious safety-jack preventing the loss of pipe in case of any breaking of the wire rope or attachment, and the drilling machine is then brought back into exactly the former position.

With each machine are provided drill rods for drilling 200 feet of hole with, proper connections; a core barrel to receive and preserve the cores as cut; two core lifters of an improved pattern; a diamond drill head, set with castings of best quality; an improved safety jack and lifting jack, and the necessary tools and equipment. The Berry & Place Machine Company in this city are agents for this machine for the Pacific Coast.

Early History of the Comstock—No. 5.

Since my return from Arizona my attention has been called to a letter in the PRESS over the signature of Robt. G. Lowery, of Virginia City, Nevada. Mr. Lowery says I took over the first ore from the Comstock, and gave the same to Mr. Theal, of Marysville, for assay, and that this was the first. This is a mistake. My first trip to the Comstock was about the 1st of July, 1859. B. H. Harrison had already taken (in June, 1859) some ore to Grass Valley for assay. About the 9th or 10th of July, 1859, I sent to Marysville by John C. Fall for Mr. Theal to assay some ore. Mr. Lowery's letter as to particulars is correct enough excepting as to dates.

E. P. MCCURDY.

San Francisco, October, 1883.

DOUBLE EDITION.—The next number of the MINING AND SCIENTIFIC PRESS will be a double one, and will contain a very complete description of the latest built of our local cable roads. It will be fully illustrated. The number will be one suitable for sending away to people elsewhere, who are curious as to the mode of operation of cable railroads.

THE SALMON WELLS.—We recently made mention of the gas well on the ranch of Cutler Salmon, near Stockton. The gas has continued to flow, and Mr. Salmon has piped it all through his house, and is using it for illuminating and heating purposes. He believes his water wells have peculiar curing properties, especially for kidney troubles, and proposes to build a bath-house, sanitarium, and otherwise improve the property as a health resort.

THE Bank Presidents of Boston have adopted a resolution that the speedy enactment by Congress of a national bankrupt law, equitable in its provisions for debtor and creditor in all sections of the country, is indispensably necessary.

On the Structure and Genesis of the Bassick Ore Deposit.

[Read before the California Academy of Sciences May 7th, 1883.]

The Bassick mine is situated in Central Colorado, about 125 miles south of Denver, on the western slope of the Wet Mountain Range, at an elevation of about 9,000 feet. It was discovered in 1877, and to-day is capitalized at $10,000,000 and its workings have attained a depth of over 1,000 feet. The first ten tons of ore taken out just below the surface returned $12,000. Unsystematic and intermittent working of the mine for two years yielded $500,000 net, leaving $2,000,000 in actual sight within 242 feet of the surface. The amount of bullion produced to date is unknown, as the utmost secrecy appears to be affected by the present owners; but it is safe to assume that it runs high into the millions.

It is, however, in the peculiar mode of occurrence of the ore body, that the main interest lies. The unusual features of the ore mass attracted the attention of the discoverer, and have puzzled and mislead the acutest observers who have thus far studied the deposit in place. My attention was first attracted to the locality in June, 1879, by Mr. J. B. Farish, at that time in charge of the Siver Cliff mine, six miles from the Bassick. A very intelligible description of the principal feature of the deposit, accompanied by illustrative specimens, selected according to my own instructions, was received. Based upon Mr. Farish's description and a careful examination of the specimens, a theory which explained the formation of the deposit to my own satisfaction was formulated and communicated by letter, Sept. 16, 1879, to Mr. Farish. It was pronounced by the gentleman in charge of the mine as the only acceptable explanation that had been brought forward.

Simultaneously Prof. J. S. Newberry, of the Columbia School of Mines, New York, delivered a lecture on the Bassick mine before the New York Bullion Club, in which, after characterizing the deposit as the most remarkable he had ever seen, he propounded a theory of its formation quite different from my own.

In the New York *Daily Graphic* of August 28, 1879 (a copy of which came to hand six months later), appeared an excellent history and description of the mine, apparently from the pen of George W. Rafter, a professional engineer of Rochester, New York, as editorial correspondent. The theory proposed by this gentleman comes nearest to my own explanation. He makes no mention, however, of a feature regarded by all as the most puzzling fact to be explained, viz., the occurrence of charcoal, at various depths, in the ore-body. An accurate cross section sketch appeared in the extra mining number of the New York *Daily Graphic* for October, 1879.

The most complete and systematic description of the ore-deposit yet made is presented by L. R. Grabill, in a paper read at the Colorado meeting of the American Institute of Mining Engineers, for August, 1882. But, while the description is excellent, the explanation of the phenomena is still very much at fault.

The latest statement concerning the ore-deposit is contained in the editorial correspondence of the San Francisco MINING AND SCIENTIFIC PRESS (Letter No. 8, from the Denver Exposition), published October 7, 1882. It may be considered as representing the current opinions of those most familiar with the deposit in its immediate neighborhood. They are still, I believe, wide from the truth.

I have thus indicated the articles that have already appeared on the subject, containing the views which I shall criticise. Before proceeding with this, however, I wish to present, as concisely as possible, a description—first, of the general topographical and geological features of the immediate neighborhood; second, of the detailed structure of the ore-deposit itself.

Fig. 1 represents the general geological features of the region adjacent to Rosita, taken from Hayden's Colorado Atlas of the United States Geological Survey of the Territory. The stars represent the cretaceous formations of the great western plain; the horizontal shading, the metamorphic granite; the dotted shading, the silurian sandstone of the Sangre di Cristo range; the crossed shading in the Sangre di Cristo represents eruptive granite; the crossed shading on the western slope of the Wet Mountains, the eruptive trachyte; the unshaded portions, quarternary. The position of the Bassick mine is indicated by the white star in the eruptive trachyte.

Fig. 2 represents a cross-section through the same region, along the line *a b*. The eruptive trachyte is represented by the vertical shading to the west of the summit of the Wet Mountains.

The Colorado Front Range (here locally known as the Wet Mountains), on the western slope of which the Bassick mine is located, forms in Colorado the easternmost range of the great system of North American Cordilleras. The tertiary and mesozoic formations of the great western plains sweep gradually up to the very base of the range, with an elevation of 6,000 feet, the latter rising some 1,500 feet on the eastern flank. The main body of the range consists of archaian granite, the highest peaks of which attain an elevation of over 11,000 feet. Wet Mountain valley, drained by Grape creek, into the Arkansas, separates the Front Range from the long, narrow, sharply defined range to the west known as the Sangre di Cristo, 13,000 feet high, consisting of a central axis of eruptive granite, with carbouiferous sandstone on the east and west flanks.

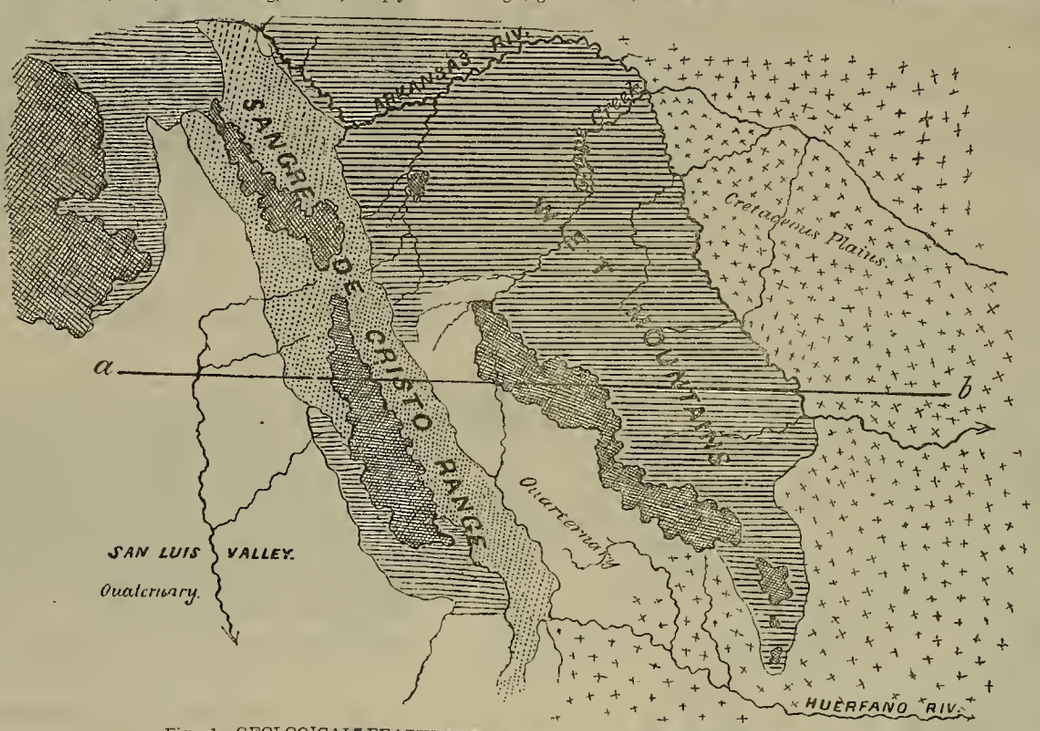


Fig. 1.—GEOLOGICAL FEATURES OF REGION ADJACENT TO BASSICK MINE.

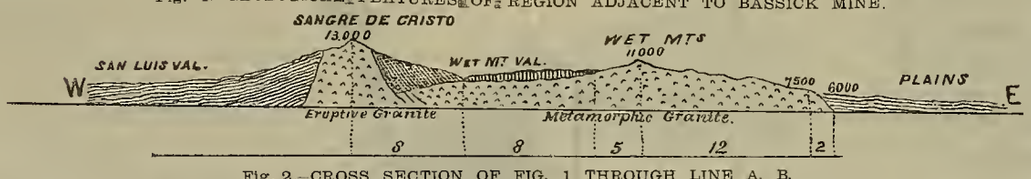

Fig. 2.—CROSS SECTION OF FIG. 1 THROUGH LINE A. B.

To the west of this range lies the great San Luis valley, covered with lake drift. The distance from the eastern base of the Wet Mountains to the summit of the Sangre di Cristo is about 35 miles. Within this region, the principal tertiary eruptives occur on the west slope of the Wet Mountains, extending down into the valley. Here a mass of trachyte, 35 miles long, 4 miles greatest width, and about 1,000 feet thick, rests immediately upon the granite. It is just within the eastern limit of this trachyte, at an elevation of about 9,000 feet, and about 5 miles west of the highest summits of the Wet Mountain range, that the Bassick mine is located. A vertical cross-section through *a b* will make the relation of these rocks clearer.

The Bassick Mine.

NOTE.—In the following description of the Bassick ore deposit I have followed mainly Grabill: "On the peculiar features of the Bassick mine," Trans. of the Amer. Inst. of Mining Engs., Aug., 1882:

Coming now to the immediate vicinity of the Bassick mine, we find it located within the limits of the trachyte on the western flank of the Wet mountains, about half a mile from the contact with the granite formation. The ore body crops out on the summit of a small elevation known as Bassick Hill, which terminates a short spur running out to the southward from Mount Tyndall.

[Fig. 3 represents in plan the relation of Bassick Hill to Mount Tyndall, kindly sent to the writer by Mr. J. B. Farish. The dotted line connecting the summit of Mount Tyndall with the Bassick shaft indicates the course of the connecting ridge. Fig. 4 represents a cross section through A B of Fig. 3, taken from the mining number of the New York *Graphic* for October, 1879, the accuracy of which is vouched for by Mr. Farish.]

The hill is about 200 feet high, and from 700 to 1,200 feet across the base. This whole hill consists of an apparent "conglomerate," *i. e.*, of more or less rounded fragments varying in texture from porphyritic to quite compact; in color, from gray and pink to white; and in size, from the fraction of an inch to 'rarely' 20 feet; although most of the "bowlders" are not over 1 foot in diameter. At first glance, the bowlders appear to represent more than half a dozen different kinds of rocks, and, indeed, it would be difficult to convince an ordinary miner that such was not the case. A careful microscopic examination of those at my disposal has convinced me that all are primarily from at least three varieties of sanidine trachyte, a post tertiary igneous rock that has been poured forth in colossal masses within the limits of the Cordilleras. The causes of the variation in texture, color, and size, being intimately connected with the genesis of the deposit, I will explain subsequently. This bowlder appearance can also be traced for some distance up the ridge, connecting with Mt. Tyndall, where it gradually passes into solid, normal, igneous rock, identical in character with that of the bowlders, viz: sanidine trachyte. On the other side, to the south of Bassick Hill, the same gradual passage is observed, from the bowlder fountain to the solid, normal trachyte, also similar to that on the north. On the very summit of Bassick Hill, it was observed by the discoverer that each of these rounded bowlders was inclosed in a thin, uniform layer of ore. Subsequent developments have shown that a body of these ore-coated bowlders, varying from 60 feet to 100 feet in width, runs directly over the summit, and is traceable on the surface a distance of 400 feet. This ore body has been followed almost vertically downward over 1,000 feet, the entire mass consisting of bowlders with concentric coatings of ore.

The coatings vary, however, both in character and thickness across a horizontal section, and also in depth. In the center of the deposit and near the surface, the coat or shell usually consists of several concentric layers in immediate contact with one another, like the combs of an ore vein, but with the line of separation distinctly marked. The inner shell has a maximum thickness of about 3-16 inches and is a mixture of zinc blende, galena, and a double sulphide of lead and antimony, and carries about 60 oz. silver, 3 oz. gold.

The next coat or shell (not always present) is somewhat similar to the first, slightly thicker, but carries as high as 200 oz. silver, 100 oz. gold. The third consists mainly of coarsely crystalline zinc blende varying from ¼ inch to two inches in thickness, and carries the larger portion of precious metal in the mine, viz:

60.—120 oz. silver.
15.—50 oz. gold.

This is often the last coat, and when so, the angles of the sphalerite crystals project outward into the free space between the bowlders. A fourth coat, consisting mostly of chalcopyrite, is sometimes present, but exceedingly thin, carrying:

50.—100 oz. silver.
50.—100 oz. gold.

Rarely a thin sprinkling of pyrite crystals is found on top of the chalcopyrite, and may be looked upon as the fifth coat. The irregular space between the ore-coated bowlders is filled, partially or wholly, with powdery white kaolin; calamite and smithsonite are often met with in the upper portion of the deposit.

In passing from the center of the deposit outward, the coatings decrease in thickness: one or more disappear, until gradually, after becoming exceedingly thin, they disappear entirely, and this takes place *both ways* from the center *outward*.

From the center *downward*, the coats *increase* in thickness. At a depth of 150 feet below the summit of Bassick Hill one passes across a sharply defined water-line, above which all is oxydized, dry and "dusty;" below which the ore is bright, fresh, and very wet. Fahlore, the tellurides of gold and silver, with a quartz gangue, partially or completely fill the spaces between the ore-coated bowlders. The coatings become so thick as at times to *completely displace* the bowlder nucleus, and apparent bowlders of solid ore result.

A further feature, and one that has attracted more attention, perhaps, than any other, is the occurrence of fragments of charred wood—actual charcoal—in various parts of the deposit, from the surface to the deepest workings. It is sometimes silicified. It is far from plentiful, in fact, is of rare occurrence, but a piece is found now and then, sometimes imbedded completely in the ore, sometimes between the bowlders, sometimes imbedded in trachyte or bowlder nucleus.

It is the occurrence of this charred wood in the ore body (it is found equally, however, without the limits of the ore mass) that has most completely puzzled those who have examined and spoken, or written on the subject. The particular form which their theories have taken has been determined largely by the necessity for accounting for the presence of this charcoal.

Theoretical Considerations

I have presented very briefly the principal features of this famous ore deposit. I do not go more into detail because I do not intend to consider any of the minor questions involved, questions of the utmost importance in themselves, but which are equally involved in a detailed theory of the genesis of all ore deposits of metallic sulphides.

I shall attempt to sketch only the general features of a theory. This mine has been represented as something marvelous, as something entirely unique. Mr. Rafter says of it that "if it had been examined by the traditional gentleman who believed nothing he heard, and only half what he saw, he would from that moment have rejected even this slight credit of his senses. It is so different from everything else in the way of mines, so superior to all previous mining experiences that it is difficult to realize it after one has seen it, and impossible to describe after one has left it."

Mr. Grabill finds it replete with unsolvable problems. Now, I wish to show that the deposit is not unique, except, perhaps, in respect to the *scale* upon which the phenomena are presented; that we do not have to modify the currently received explanations of geological phenomena a hair's breadth in order to include within them all that we find on Bassick Hill. Each single feature presented here, apart from the others, has been observed elsewhere, and satisfactorily explained. Their occurrence together, and on so large a scale, constitutes the only novel feature, and even this might have been predicted.

I wish, then, simply to bring the Bassick mine into line with other fissure deposits, to show that the same general explanation accounts for all, and that local conditions entirely explain local differences.

First, a few words concerning the theories already proposed, and my objections to them.

Prof. Newberry's Theory.

Prof. Newberry's was first suggested; it is briefly this:

An open fissure was first formed, into which the drift material from the surrounding region, consisting of rounded, water-worn cobblestones

(CONTINUED ON PAGE 230.)

MECHANICAL PROGRESS.

Coke Driving out Anthracite.

During the present year coke has made startling inroads into the foundry of anthracite coal in the Eastern and Middle states, where formerly the best grades of Lehigh lump were used to melt the iron, in cupolas, for machinery and stove castings. Connellsville, Snow Shoe, and other cokes are so extensively used that not more than one-quarter or one-fifth of the quantity of anthracite used years ago is consumed. The low price of the coke and the comparatively stiff figures for the anthracite, have, of course, brought about this revolution. It is likely that the difference between the price of the two grades of fuel will not remain so great for any length of time, but the new rival is undoubtedly in many respects better suited for the purpose, and it will be difficult to dislodge it.

In regard to the use of petroleum, a contemporary says: Favorable reports of the latest efforts to smelt iron with crude petroleum we greatly fear have possibly exaggerated into a success what at bottom was an altogether unpromising failure. The attempt was made at iron works in South Boston with the Hayden generator, an elaborate and costly appliance, the invention of a naval engineer, which seems to be a sort of combination of the best features of every other like intended apparatus hitherto invented. This apparatus and experimentation with it have cost large sums of money.

Crude petroleum is to be used of the grossest sort, and even residium according to the friends of this invention, but we have seen it flatly asserted that in the course of the Boston experiments naptha has been worked in equal parts, at least with the crude patroleum employed, and that no attempt has been adventured to use the crude oil alone, while the requisite apparatus is altogether on too large a scale, and the accompaniments of the real furnace are so many and so expensive that the method should present overwhelming advantages in order to be adopted by any parties not interested in the success of the company owning the method.

Band Saw Blades.

A correspondent of the *American Journal of Railway Appliances*, who has been making some experiments in the strain of band saw blades, says:

"While I do not consider that they are exhaustive, I think they pretty nearly represent the average practice. Of course there is a wide difference in the ideas of operators about the necessary amount of tension on a blade, and my figures are based on my own judgment. The strain was weighed on an ordinary platform scale, by means of a lever and suitable fulcrums.

"For 3-16 inch blade, No. 21 gauge, running 3,500 to 4,000 feet per minute in ordinary sawing, the strain is 151 pounds. For ½ inch blade, No. 21 gauge, same conditions, 214 pounds. For one inch blade, No. 20 gauge, same conditions, 258 pounds. These figures are actual tension on the blade, the weight of the wheel and its bearing, and the friction on the ways first being deducted.

"On a heavier machine of my make for splitting or re-sawing, a 2½ inch blade, No. 20 gauge, running 5,500 feet per minute, cutting 19 inches wide, has usually from 1,100 to 1,300 pounds tension, including the weight of wheel and bearing and the friction on the ways."

In this connection it may be remarked that not every person can run a band log mill as they are now made. This is the principal reason that band-sawed lumber sells for more than circular-sawed. The man who successfully engineers a band saw mill is always capable of doing first-class work, and with the advantages his machine possesses over the circular mill for nice work, there is little wonder that his produce sells for more. There is likely to be a fond call for competent band saw millers within the next few years.

Asphalt Mortar.

THE *Centralblatt der Bauverwaltung* describes a patented composition made at a factory in Stargard, Pomerania, which has for some years past been used with perfect success on the Berlin-Stettin railway for wall-copings, water-tables and similar purposes requiring a water-proof coating. The material is composed of coal tar, to which are added clay, asphalt, rosin, litharge and sand. It is, in short, a kind of artificial asphalt, with the distinction that it is applied cold, like ordinary cement rendering. The tenacity of the material when properly laid, and its freedom from liability to damage by the weather, are proved by reference to an example in the coping of a retaining wall which has been exposed for four years to the drainage of a slope thirty-three feet high. This coping is still perfectly sound, and has not required any repair since it was laid down. Other works have proved equally satisfactory. In applying this mortar, as it is termed, the space to be covered is first thoroughly dried, and after being well cleaned is primed with hot roofing-varnish, the basis of which is also tar. The mortar is then laid on cold to a thickness of about ⅜ inch, with either wood or steel trowels, and is properly smoothed over. If the area covered is large, another coating of varnish is applied, and rough sand strewn over the whole. The water-proof surface thus made is perfectly impregnable to rain or frost, and practically indestructible. The cost of the material laid is estimated at not more than about ten cents per square foot, and it is stated that this price can be reduced by at least two cents for large quantities put down by experienced workmen.

CARE OF MACHINES.—If, says the *American Machinist*, manufacturers could get a saving clause inserted in a contract for machines that should make clear exactly the kind of treatment they would receive after they left their hands, it would sometimes be of more value to them than the price they received for them. That machinery is ruined by improper care, or for want of ordinary care, does not matter much to them; but the fact that their reputation is frequently unjustly injured by such causes is a matter of considerable importance. Whether machines are properly set, lubricated properly, or with the cheapest oil that can be bought; whether they are handled with reasonable care or knocked about any way; whether they are kept respectably clean, or run in an accumulation of grease and dirt; all these things, and a good many others that are supposed to make no difference to the builder after the sale is effected, really do often make a good deal of difference to him so far as future sales are concerned.

LENGTH OF BOILER TUBES.—Nine-tenths of the boilers which are now being put into the woolen and cotton mills of the United States are of the horizontal tubular type.

The usual length of the tubes in these boilers is 15 or 16 feet, and hence the heated gases travel 30 or 32 feet in their journey from the fire to the rear end of the boiler and back through the tubes to the entrance to the chimney. * * After the gases have traveled a distance of 32 feet they have generally become incapable of adding further to the heat of the steam, and hence it is almost a general law that boilers in which the gases travel more or less than 32 feet from the grate-bars to the chimney are uneconomical.

NOVEL NAVAL AND SIEGE GUNS.—The French government is experimenting near Lille upon some naval and siege guns of novel construction and enormous power. One of these, as described by a technical journal, is of steel, and nearly thirty feet long. The tube is strengthened with ten coils of plaited steel wire one millimeter (.039 inch) in diameter. The composition is such that the cannon, after a few discharges, becomes elongated by three millimeters. The weight of the gun is fifty tons; it projects a shell weighing 297½ pounds, capable of penetrating armor plates nearly six inches thick at a range of seven and a half miles, and its cost has been $116,160.

LOSS OF HEAT.—A source of considerable loss of heat in many American locomotives is the fragile condition of the ordinary run of ash-pans, that do not admit of being closed tightly by the damper doors. More loss of heat is caused by this than what is generally supposed. We observe that Rogers' Locomotive Works are putting boiler-sheet ash-pans on some of the locomotives they are turning out. We commend this plan to the attention of master mechanics.—*American Machinist.*

PAPER FROM SOAP-WEED.—Pueblo, Col., is soon to have a paper and textile mill, devised to utilize the soap-weed plant that grows so abundant in the southern part of the state. More than three years ago the editor of the Denver *Journal of Commerce* sent large quantities of this soap-weed to Hadley, Mass., to test its adaptation to paper purposes. This mill at Pueblo will be the result of that experimenting.

COMPLICATED MACHINES.—A writer in an Eastern journal says: "The tendency to complicate machines and make them universal, or machines of many kinds, is fast becoming extinct. It has been usually found to be a very much more costly way to produce work than with special machines made for one kind of work, or at least not many kinds of work, and then only when they were similar in their processes and manner of production and operation."

THE WEAKEST PLACE in a boiler will always be found along the line of some seam. This is due to the fact that the edges of the sheets are frequently hammered to close seams, and sometimes so carelessly that the skin of the iron is broken; and to the further fact that scale forms most readily along seams, for reasons which are obvious.

TRAP-DOORS IN CAR ROOFS.—A gentleman who was present at a most distressing railway accident where it was necessary to break open the roof in order to extricate some of the passengers—one car lying on its side on the ground, and another actually lying full length upon the first one—suggests that trap-doors be provided in the roofs hereafter.

SPIRAL SPRINGS.—It is strange, says the *Journal of R. W. Appliances*, that with all the march of modern improvements, in theory, practice, and the adoption of theory to practice, so little has been done, and so little is known, as in the matter of spiral springs.

SCIENTIFIC PROGRESS.

Man and Insects.

The only nerves (worth mentioning) in the human body, which are not under the control of the brain, are those of the heart and other internal organs; and over these parts, as everybody knows, we have not any voluntary power. But all our limbs and muscles are moved in accordance with impulses sent down from the brain, so that, for example, when I have made up my mind to send a telegram to a friend, my legs take me only to the telegraph office, my hand writes the proper message, and my tongue undertakes the necessary arrangements with the clerk. But in the insect's body there is no such regular subordination of all the parts composing the nervous system to a single central organ or head office. The largest knot of nerve matter, it is true, is generally to be found in the neighborhood of the sense organs, and it receives direct nerve bundles from the eyes, antennæ, mouth, and other chief adjacent parts; but the wings and legs are moved by separate knots of nerve cells connected by a sort of spinal cord with the head, but capable of acting quite independently on their own account.

Thus, if we cut off a wasp's head and stick it on a needle in front of some sugar and water, the mouth will greedily begin to eat the sweet syrup, apparently unconscious of the fact that it has lost its stomach, and that the food is quietly dropping out of the gullet at the other end as fast as it is swallowed. So, too, if we decapitate the queer Mediterranean insect, the praying mantis, the headless body will still stand catching flies with its outstretched arms, and fumbling about for its mouth when it has caught one, evidently much surprised to find that its head is unaccountably missing. In fact, whatever may be the case with man, the insect, at least, is really a conscious automaton. It sees or smells food, and it is at once impelled by its nervous constitution to eat it. It receives a sense impression from the bright hue of a flower, and it is irresistibly attracted towards it, as the moth is to the candle. It has no power of deliberation, no ability even to move its own limbs in unaccustomed manners. Its whole life is governed for it by its fixed nervous constitution, and by the stimulations it receives from outside. And so, though the world probably appears much the same to the beetle as to us, the nature of its life is different. It acts like a piece of clockwork mechanism, would up to perform a certain number of fixed movements, and incapable of ever going beyond the narrow circle for which it is designed.—*Grant Allen, in Knowledge.*

Reptiles in Disguise.

Everybody is fond of birds, but it is possible that some people might like them less if they believed them to be only reptiles in disguise. Now, Sir John Lubbock, addressing the British Association in 1881, said: "It seems to be generally admitted that birds have come down to us through the Dinosaurians (wonderlizards), and, as Huxley has shown, the profound break once supposed to exist between birds and reptiles has been bridged over by the discovery of reptilian birds and bird-like reptiles; so that, in fact, birds are modified reptiles." Popular likes and dislikes are no disproof of relationship. Birds with teeth and reptiles with feathers have been cited in evidence, although, indeed, they are very like "Cuckoo, cuckoo, welcome bird, seldom seen, but often heard" of. Birds and reptiles are alike reproduced from eggs; their blood corpuscles are equally oval, not round, as in mammal animals. Both, apparently, swallow their food without tasting it. Possibly the stomach may be, with them, the seat of taste, as it often is with us when we have taken physic or eaten stale fish, or too much sage and onion stuffing with duck. Both are musical. Serpents are fond of melody, though they cannot make it. Batrachians as well as bipeds have their grand united choral societies. American bullfrog concerts are celebrated as well as numerously attended. The song of thrushes and the wailing of nightingales may, therefore, be only developments of the green European tree-frog's resonant croak, effected, as with birds, by inflated expansions of the throat, very curious to witness. Froggy looks as proud as his predecessors in the fable, and one wonders that he does not, like him, burst. Feathers may be only a modification of scales. The so-called feathers of butterflies are really scales, whence their name Lepidoptera.—*London Society.*

Storm Sounds in Telephones.

A correspondent of *L'Ingenieur Conseil* occupied himself, during a violent thunder storm which occurred at Brussels some months ago, in listening to the storm sounds in a telephonic wire. It was furnished with a good lightning conductor, and, under such circumstances, he is convinced that the experiment was not attended with danger. During the height of the storm there was a continuous noise, which could only be compared to that of frying. From time to time it would grow louder; sometimes there would be a little popping sound, like a bubble bursting; sometimes the series of crackling noises which follow the fall of a drop of grease on a red-hot iron plate. This last noise came abruptly and loud with each flash of lightning, and seemed to precede it. The observer was satisfied that he could hear the sound before he could see the flash. The same noises were often produced when there was no accompanying flash, but then they were less loud. Their force seemed to have no connection with the peals of thunder. On the 600 lines of telephone wir which focus at Brussels not one apparatus was damaged by the storm, its effects being altogether expended upon the lightning conductors and storm-warning apparatus. This security may encourage other observers to follow the example of "E. B.," who considers that in this manner it is possible to obtain valuable contributions to the study of atmospheric electricity. He is of opinion that the constant noise heard in the wires proves the existence in them of a current of atmospheric electricity flowing into the earth, and that a network of telephonic lines overspreading a town would be its best possible protection against lightning.

Earthquakes and Outbursts of Gas in Mines

The recent disastrous earthquake near Naples has renewed the discussion of the probable cause of these upheavals of the upper crust of the earth. As described in a British exchange, the terrestrial crust reposes on lava, in all probability, of a declining temperature, and the solid portions formed at the surface of the crust internally are moved upward by masses of a high temperature, tending by fusion to diminish the thickness of the crust in certain places, thus producing eruptions. A similar cause and effect is stated to result from sudden outbursts of gas in coal mines, and a British mining engineer of some eminence, who has paid a good deal of attention to these phenomena, records several sudden outbursts of gas which forced up the floors of mines and continued blowing off for weeks without intermission. At one colliery the pressure, as stated, amounted to 135 pounds to the square inch. This is analogous to the effect of an earthquake, but of course on a much smaller scale. In other ways, also, there is a similarity between outbursts of gas in mines and earthquakes, more especially as regards premonitory warnings. It is a fact frequently recorded that outbursts of gas in mines are preceded by a trembling of the earth. From these circumstances conclusions may be drawn favoring the opinion that earthquakes proceed from something like the same cause as these outbursts in mines, being the pressure of pent-up gases in the earth.

THE EFFECT OF LIGHTNING ON TREES.—The frequency of thunder storms in Switzerland this summer has afforded Professor Colladon, of Geneva, a great authority on electricity and meteorology, ample opportunity of continuing his observations on the effect of lightning on trees and vegetation generally. He has ascertained that when lightning strikes a tree it leaves very few marks of its passage on the upper part and middle of the trunk, a peculiarity which he ascribes to the fact of those parts being more impregnated with sugar, a good conductor, than the lower part. As the electric fluid descends to the neighborhood of the heavier branches, where there is less saccharine matter, it tears open the bark and in many instances shivers the tree. It is no uncommon thing to find the lower part of a tree literally cut by the lightning, while the upper portion and the higher branches seem to have suffered hardly at all. Oaks, however, would appear to present an exception to this rule, for they are often found with tops quite blasted and the passage of the lightning lower down marked by a gouge-like furrow. These furrows sometimes go completely round the tree, like a screw, the reason of which is said to be that the lightning follows the cells of which the bark is composed lengthwise, and in certain sorts of wood these cells are disposed spirally.

TESTING OILS.—Rosseau has shown that the oils, with the exception of olive oil, which has nearly one seven-hundredth the conductivity of other oils, are good conductors of electricity, and has devised an instrument to detect adulterations of that oil, which is called the diagometer. The test is made by measuring their conductivity. The instruments used are simply a galvanometer and a small voltaic battery, the current of which is passed through a small drop of the oil to be tested, and its intensity is then measured by the galvanometer. A comparison with known oils gives the evidence sought. The effect of heat upon oils furnishes another means of determining their character and of detecting falsifications. The temperature of distillation of petroleum products varies from 80° to 250° F. (27° to 120° C.); for the napthas, 250° to 600° F. (120° to 315° C.); for illuminating oils, 600° to 800° F. (315° to 425° C.), for the heavy lubricating oils. The very best oils of the latter class have no bad odor, and only vaporize at 600° F. (315° C.) or higher. Their density is about 27 or 28 B. (.890 Sp. Gr.) They are rarely used unmixed with lighter oils.

A SUBSTITUTE FOR QUININE.—Professor Fisher of Munich has succeeded in obtaining from distilled coal a white crystalline substance, which, as far as regards its action on the system, is exactly the same as quinine, though it assimilates with the stomach more easily than quinine does.

THROUGHOUT all the wine districts of France the crop is the finest in quantity and quality since 1858. In the champagne districts the crop is enormous and of the highest excellence.

YELLOW fever is still raging at Hermosillo, and the rate of deaths increasing. Many bodies are buried without being coffined.

Mining Share Market.

Nothing startling has occurred in our stock market this week. Our stock tables show what slight fluctuations have occurred. The *Enterprise*, in speaking of the explorations in the Union and Sierra Nevada, says it is pretty certain that a great amount of quartz will be found on the 3100 level, and should the improvement be as great between the 3000 and 3100 as it was between the 2900 and the 3000 levels, a great deal of ore should be found. That ore will be found on the 3100 level is pretty evident from the fact that streaks are now coming in at the bottom of the winze, but a few feet above said level, that assay from $20 to $50. In drifting west on the 3100 level there is every indication that ore will be found.

The Hale & Norcross folks are now drifting north and south from their 2700 station, and will soon be out far enough to start cross-cuts. When the drifts are each out 40 feet, it is intended to start two cross-cuts west. Counting the width of the station at 20 feet, these cross-cuts would be about 100 feet apart. They are now in ground of a favorable appearance. The new cross-cuts will be very closely watched by mining men.

At Gold Hill all the mines are preparing to resume the regular extraction of ore. The winter storms having now set in, there is likely soon to be sufficient water in the Carson River to allow of all the mills being run to their full capacity.

At the Alta they are fast clearing out the lower evels of water and will soon be down to the 2150 level at the present rate of progress.

Bullion Shipments.

Christy, Oct. 4th, $4,036; Northern Belle, 3d, $14,365; Christy, 8th, $3,330; Alhambra, Sept. 27th, $4,880; Mt. Diablo, Oct. 3d, $9,350; Hanauer, 3d, $3,130; Stormont, 3d, $3,020; Vienna, 4th, $1,441; Ontario, 4th, $4,580; Horn Silver, 4th, $21,000; Vienna, 5th, $1,463; Ontario, 5th, $4,296; Horn Silver, 8th, $21,000; Hanauer, 6th, $2,600, Crescent, 6th, $3,720; Stormont, 6th, $4,600; Ontario, 6th, $5,161; Vienna, 6th, $1,333; Horn Silver, 6th, $12,000; Vienna, 7th, $1,418; Horn Silver, 7th, $15,000. During the week ending October 5th, there were shipped from Salt Lake 44 cars of bullion, 1,134,120 pounds, sent East; 17 cars of ore, 362,000 pounds, sent East; 10 cars of ore, 288,030 pounds, sent West, and one car white lead, 25,000 pounds, sent West, making a grand total of 72 cars, aggregating 1,809,150 pounds.

BACKED DOWN.—About two weeks ago the Grass Valley papers stated that the long-standing $1,000 challenge of Adams & Carter, that the Frue concentrator could do better work than any other machine, had been accepted by the Hendy and Farwell concentrators. And further, that the contest would take place at the Empire mine, in Grass Valley district. We learn from undoubted authority that the contest will not take place, as the proprietors of the Hendy and Farwell concentrators have not sufficient faith in their machines to back their opinions, thus leaving the Frue in the field as the champion concentrator of the World.—*Nevada Transcript.*

THE National Bank of New Orleans has brought suit against the Postmaster-General for $100,000, for directing that money orders addressed to the bank, but intended for the lottery company, shall not be delivered. Plaintiff considers that the order was intended to charge the bank with fraudulent practices and illegal action, and has seriously damaged its business.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SEATON.—*Ledger*, Oct. 5: This week the company paid off the liabilities, and the attachments were released. It is understood that new parties have purchased an interest, Alvinza Hayward among the number. Work on the mine has been resumed. The shaft is down 500 ft. It is the intention to sink 50 ft further. Assays of rock taken from a depth of 500 ft yielded handsomely. Although the outlook is encouraging.

NOTES.—The contractors at the tunnel at Middle Bar tried running by hand drills, but they found the rock so hard that it was impossible to make wages. The Bunker Hill mill was started again Wednesday with 20 stamps, after a period of idleness on account of scarcity of water.

PLYMOUTH.—Cor. *Dispatch*, Oct. 6: The rain has done wonders for Plymouth. The Empire mill is running 50 stamps, and just before the rain they could only get 15 stamps to go with the head of water they had. If the water continues to improve, the mill will have 60 stamps going before the week is out. It makes Reeves, the mill boss, laugh to hear the thunder of so many stamps once more.

ANOTHER RICH STRIKE.—Mr. Crannis struck a large body of extraordinarily rich rock the other day in his mine at Middle Bar on the Mokelumne River.

VOLCANO.—If the rain will continue a little while longer the gravel miners will make a start. All the quartz mines are making progress. R. C. Downs is sinking 200 ft in south shaft of his mine. We understand that he has very rich rock. Gillick & Philips are about to start up their mill, as they have 75 tons of rock which will average $35 to the ton. We have seen a specimen from the mine which will run $500 to the ton. All the mines on Pioneer are working. Jake Griesbach is getting out rich rock, also the Modoc. The Tunnel Co. have completed their new flume and are ready for water.

SUTTER CREEK.—The Mahoney mine complication is still in an unsettled state. Another agreement has been gotten up. The outside creditors, some of whom are men of means, are willing, on being secured, to advance money required to start up the mine. The water is being kept out, and every effort is being made to perfect arrangements.

Calaveras.

MURPHEY'S.—*Citizen*, Oct. 6: The Oro Plata mill will soon shut down for repairs. The prospects of this mine are flattering. On the 100 level the vein has widened to six feet, in splendid rock, assaying $12 per ton.

CALAVERAS MINE.—Tom Goodwin started the compressor in the Calaveras Mine on the 29th ult. Everything is looking well in the mine, the vein on the 400 level opening out splendidly.

NOTES.—*Mountain Echo*, Oct. 4: A piece of quartz about 10 pounds weight, was taken from the Gold Hill mine last week, which is estimated to contain over $400.

Rumor says that good ore has been struck in the Porter mine, located on Carson Creek. Some say that the ore assays as high as $200 per ton

GOLD KING.—*Sierra Tribune*, Oct. 4: Mr. Weldon located the Gold King claim by the use of his magnetic survey. There was no ledge visible where he started a tunnel. Several months ago the ledge was encountered, since which time 150 tons of ore has been taken out. Mr. Weldon states that this pile of ore will pay him for every dollar he has expended thus far. Recently a winze was sunk 18 ft. The ledge is from 4 to 5 ft in width, showing gold freely. A survey is being made for a tunnel that will tap the ledge 100 ft below.

El Dorado.

EUREKA.—*Gazette*, Oct. 5: Since the trouble with the Tasker pulverizer has been overcome, it has been working very well. It appears that the ball had been running too tight in the mill. Since the loose ball has been working, two and a quarter tons of rock has been put through the mill with a No. 40 screen in 1 hour. The amalgam is accumulating nicely, showing that the ore is yielding good returns. Some rich ore has been struck in the mine this week.

Fresno.

MT. RAYMOND.—Mariposa *Herald*, Oct. 5: Alfred Cannon of Fresno Flats was in town Tuesday. He says there is as much interest in Mt. Raymond now as there was 6 weeks ago. It is believed that George Hearst wants to secure a number of claims, and so speaks unfavorable of the mines. San Pedro, however, has men at work taking out rock. He says he will prove that he was not exaggerating when he pronounced Mt. Raymond the biggest silver discovery of recent years.

Inyo.

CLOVER PATCH.—*Independent*, Sept. 29: M. G. Nixon, was in town during the week. He sold his interest at Darwin in the Defiance mine and furnaces, but will not leave this section. J. M. Nicholson accompanied him. The property consists of the Banner mine and the Wild Rose mill, situated 7 miles south of Benton. The mine has been well developed, and is already credited with a yield of $50,000. Mr. Nixon will start up the mill within the coming week.

Mariposa.

NUMBER NINE.—John Mitchell writes the *Gazette*, Oct. 6: Between the 2 shafts, several thousand tons of ore have been taken out, which paid in free gold from $7 to $15 per ton, and I venture to say there is at least 20,000 tons yet remaining between these shafts that will mill $7 per ton, which can be dropped at the mill for $2 per ton.

Mono.

STANDARD CON.—Bodie *Free Press*, Oct. 2: During the week there were shipped to the mills 1051 tons of ore. The bullion shipment was valued at $38,233.72. The east cross-cut, 1200 level, was advanced 13 ft. South drift No. 2, 1000 level, was run 11 ft; total length 325 ft, showing 5 ft of vein.

BODIE CON.—During the week ending the 29th 137.45 tons of ore were sent to the mill. The assay value of the pulp was $50.45 per ton; that of the tailings was $5.87 per ton.

BULWER CON.—The west cross-cut from the north drift, 700 level, is in 485 feet; progress during the past week 10 feet. The ground is hard. North drift, same level, was run 8 feet.

KENTUCK.—Between $18,000 and $20,000 per month is being taken from this mine. The ore assays high. The small mill is kept in operation night and day.

Nevada.

CENTENNIAL.—*Transcript*, Oct. 4: Since the storm the surface water has been pouring into the shaft of the Centennial so fast that the machinery could not control it, and further sinking has been postponed while 70 ft of tunnel is being run. This tunnel will carry off the surface water, and the shaft can be pushed down without delay.

HUSSEY.—*Tri-Weekly Herald*, Oct. 6: John Hussey, of You Bet, has purchased a one-half interest in the Hussey quartz mine at Willow Valley. The property promises to be one of the best in the district.

Placer.

DAMASCUS.—*Cor. of Herald*, Oct. 6: The Hidden Treasure is the boss mine at present. They employ about 90 men, wages $3 per day, and it pays a handsome dividend every month to its owners. The Mountain Gate Mining Co. are sinking a new shaft at the far end of the lower tunnel and about 800 ft from the present incline. When completed it will be 50 ft deep. A large overshot wheel will be used to pump the water and hoist the dirt. It will take two or three months before much pay can be taken through the new works. The main tunnel is 7,200 ft, and the gravel channel 300 ft wide, no doubt continues on to the celebrated Hidden Treasure mine on the other side of the ridge. Farther up the divide is the Golden Fleece, Hogs-back, Black Canyon, Greek Claim, and others too numerous to mention, all expecting big things in the future.

ALTA.—Dutch Flat *Times*, Oct. 6: The Alta Placer Mining Co. have organized and gone to work. They are now sinking a shaft which will probably reach the bottom at a depth of 220 ft, with a fair promise of favorable results. It is well known by miners generally that the location covers the junction of two extensive gravel channels. It is only a question of time to develop the great wealth that lies buried in these ancient river channels for many miles to the east, and also west to Dutch Flat.

San Bernardino.

CALICO NOTES.—Calico *Print*, Oct. 6: Work is progressing on the Blackfoot, and fine ore is being taken out. Mr. Sinclair has resumed operations on the Mountain View. Burke & Hutchins are taking out ore from the Sam Houston No. 2. The Taggart mine has closed down for the present. The Oriental has closed down and the hoisting works are removed. The last we heard from the Cuba No. 1 boys, they were making their work pay. Work is progressing on the Snow Bird; good ore is being taken out. The King mine has sixty men at work and is progressing in first-class order. The bullion shipment still remains about $12,000 a week.

Sierra.

RICH QUARTZ.—*Messenger*, Oct. 6: Rich quartz has lately been discovered in the Fisher & Bros. ledge on the east branch of the South Fork, two miles above Sierra City. Several specimens valued at from $10 to $250 have been found. Streaks of gold a quarter of an inch thick seam the quartz. A tunnel is being run on the ledge, and the vein is from 18 to 20 inches wide.

SWALLOW.—The Swallow Co. has received $1,100 of the $1,500 for which they sold their tailings. The Co. has let a contract to run 200 feet of tunnel, for the purpose of reaching a back channel which has been worked by the Exchange Co.

GIBSONVILLE.—Cor. *Messenger*, Oct. 6: Union Co. have been working with an incline. Gravel averages $2 per carload. But just enough water now to prospect. Their main tunnel is 4,000 ft long, with but two turns, like that of the Bald Mt. Extension, Forest City. Gravel is carried out this distance by Chinese carmen. Forty men are employed. Fully 10,000 carloads of gravel in the dump awaiting water. Nine hundred carloads a day are being rolled out. Last spring, $26,000 in coarse gold, assaying 935 fine, was sluiced out. Incline is 100 feet long and 30 feet perpendicular. The cost of pumping at incline per day $11. Hooker pump used. Gold worth at mint, $19; sells at Wolter Bros. for $18.25 an ounce. Largest nugget found here weighed 80 ounces. There are 1,000 feet of flume. The Union tunnel was started in '56 and has been almost continuously worked.

Trinity.

SPECIMENS.—*Journal*, Oct. 6: From John E. Gibson, of Deadwood, we have received several pieces of splendid-looking quartz, some from the Enterprise, at 50 and 185 ft, and some from the Black Bear, 70 ft below the tunnel or 430 ft from the surface. Rowles & Diener send us some rich specimens from their Skidmore mine on the forks of Buckeye, on which they have a tunnel 70 ft. We learn that an assay of this rock returned $107 to the ton.

Tuolumne.

BONANZA POCKET.—*Independent*, Oct. 6: The papers of Amador have made a big breeze about the pocket recently come upon in that place, and claimed for it the largest amount of gold ever taken out at one time in California—the sum being $100,000. The Clark & Bray find in Sonora, or the "Bonanza Pocket," so called, turned out 960 pounds of gold, which coined in the neighborhood of $198,000; since which time, from $75,000 to $100,000 has been taken out.

LUCKY MARCUS.—There are rich veins at Sawmill Flat, about Bald Mountain. Antone Marcus recently got six ounces to the pan from a lead about 5 or 6 inches wide, which runs from Sawmill Gulch into Bald Mountain.

TIOGA.—*Democrat*, Oct. 6: From a gentleman who has just returned from Tioga the *Union Democrat* learns that the prospects for that camp are bright. The tunnel of the Great Sierra Mining Co. is in over 1000 ft, and it is expected to tap the Mount Dana and Sheepherder ledges by the first of January. Several small stringers have been cut, some of them carrying fine galena.

HOLMAN.—Mr. S. H. Teeters exhibited at the *Democrat* office some exceedingly rich quartz, showing free gold and sulphurets, from the Holman mine in the Sugar Pine district. Mr. Teeters is down on

the Holman 60 ft. The vein in the bottom is 6 inches in width; all fine milling quartz.

WEBSTER.—We learn from Major Phil. Stoner that the Webster Mine at Yankee Hill is showing up well. The shaft is down 40 ft with a ledge of first-rate milling quartz eighteen inches in width in the bottom.

THE LAMPHIER.—An incline shaft has been sunk to a depth of 165 ft on the ledge. In the bottom the ledge is 3 ft thick, all solid milling quartz. From the bottom of the shaft a drift is being run north on the vein. This drift is in 30 ft, with 20 inches of very rich milling quartz in the face, much of it showing heavy sulphurets. On the dump is a large quantity of quartz which will mill $45 to the ton just as it comes from the mine

NEVADA.

Washoe District.

UNION CON. - *Enterprise*, Oct. 6: The joint Sierra Nevada winze below the 3000 level is nearing the 3100 level. The bottom shows a stratum of quartz, which is dipping to the east at an angle of 75 degrees. This quartz has the appearance of being part of a solid deposit of considerable size.

OPHIR. Good progress is being made in the several exploring drifts on the 150 level. In running these, some ore is being saved for milling, but regular mining has not yet been commenced.

YELLOW JACKET.—The exploring drifts on the Sagebrush level are making good progress. In running these, some good ore is being found and saved for milling. No regular mining is yet being done.

MEXICAN.—The connection between the raise from the 2900 and the winze down the 2700 level has not yet been made. The raise appears to be too far east to strike the bottom of the winze. The main north drift on the 3100 level is in ground that continues favorable.

HALE AND NORCROSS.—The drifts north and south from the 2700 station will each be extended about 40 feet, when two west cross-cuts will be started and simultaneously driven into the vein.

CROWN POINT.—Work is being resumed in the upper levels, and as soon as the mills on the river start up, a full force of men will be set to work.

ANDES.—Some good ore is being extracted from the streak of quartz lying upon the west wall in going north. Are drifting north and south from the bottom of the winze.

SIERRA NEVADA.- On the 2900 level the main north drift in progressing at the rate of 20 ft per week.

GOULD AND CURRY.—On the 2500 level east drift No. 3 is making over 50 ft per week. The ground is not so hard as it was last week.

CALIFORNIA.—Since setting up the hoisting engine more rapid progress has been made in sinking joint Con. Virginia winze No. 2.

CON. VIRGINIA.—More rapid progress has been made in sinking joint California winze No. 2 since the setting up of the hoisting engine.

SOLID SHAFT. - During the last week the miners have been fixing up and repairing the timbering.

ALTA.—The water is out to a point below the 1800 level, and still continues to be lowered rapidly.

UTAH.—The north drift on the 1350 level is being pushed ahead at the rate of 30 ft per week.

SCORPION.—The west drift on the 500 level is in ground of a favorable character.

IMPERIAL.—Are preparing for the opening up of the old levels of this mine, the Alpha and the Exchequer.

COMBINATION SHAFT.—The big station for the new hydraulic pump at the 2600 level will soon be completed.

OVERMAN.—Are extracting some very good ore from the old upper levels.

UNION SHAFT.—Are still engaged in easing timbers at the 2300 station.

BELCHER.— Are preparing to resume the extraction of ore.

Belmont District

BELMONT MINE.—*Courier*, Sept. 29: Official report of Supt. is as follows: Shaft No. 1 in Laity ground is being pushed down rapidly and showing good ore. All the stopes in this as well as Moore & Martin ground show splendid ore. Track is being laid in south tunnel preparatory for hoisting ore. Shall commence hauling ore to mill to-day. Mill repairs progressing well. Expect to start the mill about the 10th.

Bernice District.

LOVELOCK.—*Silver State*, Oct. 1: Our Lovelock correspondent writes that C. W. Gilbert, just in from Bernice, reports the camp lively. In consequence of the scarcity of water the mill is running only on half time, but for all that, Supt. Bothwell has a bar of bullion ready for each stage. As soon as rain falls it is expected that there will be water enough to run the mill steadily.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Oct. 6: The streak of sulphurets in the southwest drift on the fifth shaft level has improved somewhat in width, and a stope has been started. The main cross-cut on the same level continues in very hard quartz, and has advanced 10 feet. The new cross-cut on the fourth shaft level has been extended 10 feet, making its total length 31 feet. The stope on this level is producing some very good ore, though limited in quantity. The total bullion shipments amounted to $30,839.65 for the month of September.

MOUNT DIABLO.—The drift from lower winze No. 2 has developed some 10 inches of $40 ore. The stope from this winze shows some improvement, and is giving considerable $60 ore. The stopes below the third level, near winze No. 1, are yielding a good deal of $50 ore. The stope above the west drift on the third level is giving some $40 ore from a wide ledge. A bullion shipment was made September 27 of $4,962.67, and one on October 3 of $9,350.36 making a total of $51,708.74 on September account.

COLUMBUS CON.—All work in this mine during the week has been followed by good results. The connection lately made between the new shaft and the Bonanza winze has proven to be of great advantage. When sinking was resumed in this winze, it was down to a depth of 83 feet. It has now reached 107 feet. The bottom shows streaks of very rich ore.

Eureka District.

EUREKA CON.—*Sentinel*, Oct. 7: This mine was looking better yesterday than for the past twelve months. The recent development on the 1200-foot level has gradually improved. Other parts of the mine, worked through the old shaft, have also brightened materially during the week. The developments in the K K ground continue with cheering results. Yesterday the pump was again lowered in the Locan shaft to within 28 feet of the drift, although the water stands at about 58 feet. If no accident happens to the machinery, it is thought the flood can be reduced to the pump-level within a few days.

NOTES. *Sentinel*, Oct. 4: Richard Berryman, from the Fair Play mine, is awaiting settlement for ore shipped to the furnaces. Uncle Dan Hall has a magnificent specimen of ore from the Sunset mine on Prospect Mountain. It is heavy with lead, and very rich in gold and silver. Graham & Co. are sinking the new shaft on the Page & Corwin mine, Secret Canyon. Not only are the indications good, but small bunches of good ore are daily encountered. Martin Piantoni reports the Dead Broke mine looking well. He has made two new strikes during the week; the ore, although in no large bodies, is exceedingly rich. In the mines on Adams Hill and Prospect Mountain, there are hundreds of thousands of tons of what is known to the furnace-men as dry ores, containing little or no lead, that will yield from $20 to $30 per ton in gold and silver. Eighty-five tons of ore was shipped during last month from the Silver Connor mine on Prospect Mountain, to the Eureka Con. furnaces. It yielded at the rate of $37 per ton, $28 of which was gold. The owners received for it $18 per ton, which left them a good margin after all the expenses of mining, etc. were paid.

Pioche District.

MENDHA WORKS BURNED.—*Record*, Sept. 29: The works at the Mendha mine, the property of the Day Co., at Highland, nine miles from Pioche, were destroyed by fire on Tuesday. It is supposed that the fire was caused by the forge in the blacksmith shop. It was thought that the men would be able to get down into the mine on Friday, and learn what damage had been done by caves, if any. The hoisting works were good substantial buildings, having been erected a little over a year ago. The destruction of the works will occasion some little delay. If it had not been for the mine having two shafts, the men in the mine would have been smothered.

OSCEOLA.—Ward *Reflex*, Sept. 25: This mill will certainly drop stamps before snow flies. Between 10 and 15 men were to have been placed to work in the mine on Friday, and more will be put on as fast as room can be made for them. About fifty men will be employed. The hoisting works are well under way.

Railroad District.

BULLION.—Elko *Free Press*, Oct. 5: One of Yeates' teams arrived from Bullion, Railroad District, this morning, with 85 bars of bullion, weighing 8,180 pounds. Another team is expected to-night or to-morrow morning with about 20,000 pounds of the bullion. This is the first run from the new furnace, which is working splendidly.

Tuscarora District.

NAVAJO.—*Times-Review*, Oct. 5: The air compressor now being erected at the Navajo mine, will effect a radical improvement in the system by which work in the Navajo, Belle Isle and North Belle Isle is conducted. A drift is being run from the North Belle Isle to connect with the Belle Isle, and when completed, there will be continuous connection along the entire line of the three claims. Pipes will be laid along the entire length, and Burleigh drills will be worked by the same power by all. The connection will be made by the end of the present month.

WHITE ROCK.—*Times-Review*, Oct. 1: B. Wisker, prospecting at White Rock, has made a number of locations. One in particular, the "Monarch of the West," which had been located and abandoned, shows up remarkably well. Mr. Wisker ran an open cut about 70 feet from where the first locators did their work, and struck a vein of rock, eighteen inches in width, through which mineral is uniformly dispersed, and which from appearances will assay well in silver. The ledge is nearly eighteen feet in width on the surface.

GOOD HOPE DISTRICT.—There are fifteen men employed, and all are satisfied with the prospects. The Con. Buckeye, owned by Dallas & Hainc, is leased for a term. The shaft has been sunk 50 feet and 150 tons of ore milled, some of which worked upwards of $300 per ton. The Patience mine is producing a considerable amount of high-grade ore. The Golden Era is producing some very fine ore. The ledge is narrow at the surface but is widening uniformly. The Big Muddy has a perpendicular shaft of 60 ft, showing at the bottom high-grade black sulphuret ore which assays from $100 to $900 per ton.

ARIZONA.

PINE SPRING MINE.—*Miner*, Sept. 28: From Mr. Wm. R. Morgan, one of the owners, we learn that the original shaft on this mine was carried down 102 feet, which was as far as it could be carried with their present hoisting machinery, and they are now running a drift south at the 72-foot level. Here the ore is a heavy wire-silver; specimens thus far obtained are very high grade, and go to show that the output excels in richness anything heretofore discovered in this section. Work is being actively pushed with all the force at command.

NOTES.—*Courier*, Sept. 28: A concentrator is being put up by the Howell company at Lynx Creek. Henszey and McCann were in town yesterday from Turkey Creek. Mr. Henszey is pushing work on the Goodwin mine, and Mr. McCann is developing the Yankee Boy. He has sunk a twenty-foot shaft, and has struck a streak of ore which assays $2,000 to the ton. The United Verde smelter is running at its fullest capacity. A large body of copper ore was unearthed Monday in the Belle mine. The ore assays very high. A big rush is being made for the White Mountains, Apache County, where rich gold discoveries have been made. Smith and Mishler, of Lynx Creek, will leave for the new bonanzas this week. The mountains are 180 miles east of Prescott.

THE MANZANAL.—Tombstone *Epitaph*, Sept. 28: The mill is on the Sonora River, 45 miles south of the line. It was erected one year ago. The Manzanal mine is on the east slope of the range of mountains from which it derives its name, five miles from the Sonora River. The Manzanal was discovered, or rather re-discovered (for it is an old mine and bears evidence of having been worked in bygone ages), about three years ago. The main shaft is down 100 feet, from the bottom of which they are drifting along the ledge. The ore is principally chlorides, being liberally sprinkled with native and horn silver, and is absolutely free-milling and containing a trace of copper. Mr Martin, lessee, brought up with him the second shipment of bullion since the starting of the mill, and the result shows an average of more than $200 per ton for the ore thus far reduced. Like nearly all the old mines of Sonora, the Manzanal has a traditional history, which in this instance has been preserved in the archives of the Catholic church at Magdalena. According to these ancient records, some two centuries ago the Manzanal was the richest mine in Northern Sonora. It was worked by the old Spanish padres, and yielded an immense amount of bullion. But these early workers were attacked and driven off by the Apaches.

COLORADO.

GOLDSMITH.- Denver *Tribune*, Sept. 26: The most important strike of the season has lately been made in the Gold Belt. The strike was made in the Goldsmith mine, and discloses a body of mineral fully 25 ft wide from wall to wall. Of these 25 ft of ore, 15 to 22 ft retain their old characteristic gold-bearing quartz, oxidized and mixed now with cubes of sulphide of iron, while about 6 ft lying nearest the hanging wall is as fine smelting ore as ever this camp produced. The ore is a fine grained milky white quartz completely honeycombed and very brittle. It carries sulphide of lead and carbonized lead. The amount of lead varies from 29 to 68 per cent. Besides this, it carries gold, as per tests made this week at the German assay office: From 3½ to 13 ounces of gold and from 35 to 60 ounces of silver per ton.

INDEPENDENCE.—*Miner*, Sept. 29: Mr. J. P. Williams, for a test, brought down a sack of ore from the bottom of the shaft of the Independence mine, East Argentine, last Monday. It ran 70 ounces in silver and half an ounce in gold. There is a 12-inch streak of iron ore, which carries on the foot wall the ore above tested. An assay from a point a few feet higher up, gave 11½ ounces gold and 569 ounces silver per ton. There are some 12 men leasing in different parties on this mine, and all have paying ore.

CALUMET AND HECLA.—The *Tribune* says of this mine: We note by its last report, for the year ending May 1, that in the 12 months prior to that date, it spent no less than $1,250,000 in mining land. It is no wonder that the stock sells at $246 a share on $25 paid in. The managers of the company understand their own interest, and are far-seeing, sagacious men. They have paid over $23,000,000 in dividends, and a steady adherence to their present far-sighted policy will probably enable them to pay as much more hereafter.

IDAHO.

MORTON.—Wood River *Times*, Sept. 26: The transfer of the interest of 1,000 ft in the Morton mine, in Lee's Gulch, five miles south of Hailey, has been made. The price to be paid is at the rate of $30,000 for the whole mine. Messrs. Scott & Price intend to work the property for all there is in it, and to either knock the bottom out or make a mine. They are experienced mining men.

ROCKY BAR.—Mr. Richter, manager of the Alturas Co., has struck a new vein of rich ore, which is 3 ft to 3½ ft in width, and stripped for 35 ft along the vein. About 200 tons of this ore, that will yield an average of $100 per ton, is on the dump; extracted during the past 10 days.

ATLANTA.—Idaho *World*, Sept. 28: Another rich strike has been made in the Atlanta mine—fourth level. The company talks of sinking 100 ft deeper in main shaft, which is now down 400 ft. A force of 25 men are at work in the Leonora mine. The machinery of the company's 20-stamp mill is going up. The Last Chance mine is working 40 men, and their stamp mill is running constantly. The Buffalo Co., which suspended operations sometime ago, will soon sink 150 ft from surface to connect with main shaft in tunnel below. We will soon have 6 20-stamp mills running in this camp.

BANNER.—The Banner mill turned out $12,600 from the 12th to the 19th instant. Nine bars were molded, valued at $1,400 each. Ore rich in horn-silver has been struck in the east drift in the Banner mine.

SHEEP MOUNTAIN.—The Daily boys have had 30 tons of ore from their mine smelted at Bayhorse this season, and it ran up to 126 ounces per ton. The ore was taken from a 2-ft vein of galena, which is of uniform richness. There is 8 ft of red dirt alongside the vein that runs $80 per ton the lowest, and assays have been made that ran up to 140 ounces. It is the intention to put up a smelter early next season.

SAWTOOTH.—The Silver King, near the Pilgrim, was lately sold for $125,000. The Minnie Alto, joining the Scotia, had mill tests made of 8 tons first-class and 5 tons second-class ore at the Columbia and Beaver mill, the lowest going 442 ounces. The ledge is small but very rich. The Wire Silver, which adjoins the well known Lucky Boy, has a 10-inch vein from which assays have gone up into the thousands. We were shown a large block of the ore yesterday, very rich in black sulphurets and ruby silver, which we were assured would assay nearly $4,000 per ton.

MONTANA.

ANACONDA.—Butte *Miner*, Sept. 29: The immense smelting works are being pushed to completion as rapidly as possible, and Supt. McCaskell hopes to have them enclosed before the severe winter weather sets in. The main building will be seventy feet high in the center, and will inclose all the matte floors and furnaces—matte cars. The fifteen large stacks are looming up in stupendous proportions. The two calcium furnaces are each to be ninety feet high.

GRANITE MOUNTAIN.—Helena *Herald*, Sept. 29: This mine, near Philippsburg, is largely owned by St. Louis capitalists, who were on the point of abandoning operations, when all at once the workmen broke in upon the displaced vein, which since has proved to be a veritable bonanza. Developments since have exposed an ore body of the average width of five feet for a distance along the ledge of 730 feet, the quality of the ore being very rich. The Algonquin mill, under contract, is working continuously on the Granite Mountain output, handling twenty tons per day and turning out $4,000 in refined bullion every 24 hours. Ruby ore abounds throughout the ledge, and the ore averages 200 ounces to the ton.

TIDAL WAVE.—Cor. of *Inter-Mountain*, Sept. 28: Nearly all the leads are represented and work is progressing, for the miners, in anticipation of the starting up of the new 20-ton smelter, are anxious to get out ore, as they can sell it to the smelting company as soon as extracted. Several mines have been bonded and are being worked. Among those bonded is the Silver Lion. The party working this mine have fifteen tons of ore on the dump, that will average 200 ounces. The Tidal Wave mine is the oldest discovery. A large pocket was struck last week, and one man took out 243 sacks of ore in six days. The ore will average 200 ounces to the ton.

LEXINGTON.—The Lexington, owned by a French company, with head office at Paris, is developed by a 500-foot shaft. The mine produces 60 tons of ore per day of milling character, which requires chloridizing. It pulps $55, of which 5 per cent is gold. There is enough ore in sight above the 400-foot level to last two years. The first dividend of 1,000,000 francs was paid on July 1st. During the first six months of this year the bullion produced realized $638,458. The mill consists of 60 stamps, 50 of which are running on ore and 10 on salt, all of which is dry crushed.

NEW MEXICO.

LOST PLACERS FOUND.—Las Vegas *Gazette*, Sept. 26: At last the lost fields are reported found, and last night about 12 o'clock, parties started from this city on horseback, heading for the White Mountains, where the placers are supposed to be. Word came in from Camp Fleming that one of the lucky finders arrived in camp with about one-half pound of gold nuggets, and the excitement spread with the report, and the town is nearly depopulated. Provisions left this morning in wagons, following up those who left last night on horseback. Other parties are making preparation to follow as soon as possible.

BULLION MINE.—Kingston Cor. of *Tribune*: The Bullion will ship a car-load of ore from Nutt the present week. Large quantities of high-grade ore are being extracted, three ore sorters being kept constantly at work. A new hoisting shaft will be commenced shortly, on the contact about 200 feet south of the present workings. Hoisting machinery will be erected at the new shaft as soon as sufficient depth is gained. The new boiler and pumping machinery is in place on the Superior mine, and will be fired up in a few days. A large quantity of ore is already sacked and awaiting shipment.

LAKE VALLEY. The air shaft connecting the two new shafts on Bella mine has been completed, and exposed to view a face of ore thirteen feet high, top and bottom of which has not yet been reached, and fifty feet long. From these shafts, some four car-loads of ore have been shipped, and there remains on the dumps at this time about two hundred tons. Again, developments have in two cases shown places, where good ore has been walled in and covered by broken limestone, by parties who previously worked the mine. An entirely new Board of Directors will at once be elected.

OREGON.

NOTES.—Jacksonville *Times*, Sept. 28: Anderson & Wells are interested in quartz ledges in the Siskiyou mountains, near the state line, and will prospect them at once. Simmons & Co. are engaged with their mining enterprise near Waldo, probably one of the most important in the state. A copper excitement has again started up in Josephine County. Wimer & Sons of Josephine County are enlarging their ditches and flumes and expect a giant of the latest pattern and 1,400 ft of hydraulic pipe in a short time. N. DeLamatter of Kerbyville is getting his claims, in readiness and will mine on a more extensive scale than ever next season. I. T. Bryan, who is mining on Brush Creek, Steamboat District, has been getting $2.25 a day with a rocker.

UTAH.

LITTLE COTTONWOOD.—Salt Lake *Tribune*, Oct. 3: The Flagstaff is working a few men. The Emma is at work with a good force, and the vein shows well. Capt. Morrill is pushing his mines ahead well and profitably. Wagner, in the Moltke mine, has struck rich ore in paying quantities. City Rocks is at work with a full force, and is showing as well as ever. Altogether Cottonwood promises fairly to be a lively camp again. The Evergreen is at work with a force of men, at a depth of 300 ft, taking out good ore.

The *Tribune*, of the 5th, in compliance with the request of a correspondent, makes the following correction: "The ore referred to above came from the Eureka mine, adjoining the Scotia. The Minnie Alto is hardly known in the district, and has never produced a ton of ore."

WASHINGTON.

THE NEW MINES.—Cor. Nez Perce *News*, Sept. 27: The excitement is for the east branches of the north fork of the Coeur d'Aleve River. The diggings are 47 miles from the old Mission. There are but four claims opened as yet, and they are paying from $10 to $25 a day to the hand. Prichard Creek, for 15 miles, prospects about the same. By going down in the bedrock you can obtain from 10 cents to $1 to the pan. On claims I located I raised bedrock 18 inches under water, and from the clay adhering to the rock obtained 80 cents to one pan. There is but little gold in the gravel. That the camp will prove extensive I have not the least doubt. In fact it is my belief the camp will give employment to more men than any camp struck since Boise Basin was discovered.

The Virginia *Enterprise* gives later news from the new mines. The excitement is at fever heat at Spokane Falls, and many are preparing to go and spend the winter in the new mineral region. The gold is reported to be coarse, nuggets found ranging in value from $2 to as high as $40. Those who have been at work are reported as averaging from $20 to $30 per day, with only the most primitive tools and processes.

A SCIENTIFIC chemical compound that gives health and strength is Brown's Iron Bitters.

The Bassick Ore Deposit.

(CONTINUED FROM PAGE 226.)

and bowlders of all sizes, including, also, fragments of charcoal, was swept by surface drainage. Metallic solutions then came from below, coated each bowlder with ore, and cemented the whole mass firmly together.

Objections.

My objections are these: The theory requires the existence of definite vein walls. The transition from the bowlder formation to the solid country rock should be sharply defined. We find the contrary to be the case. The transition is exceedingly gradual. The presence of the charcoal, according to Newberry, proves that the bowlders have been washed in from the surface. One word about this charcoal. All observers agree in using the term "charcoal," instead of "lignite." The difference between the two is an important one. Lignite is formed from wood by a slow process at ordinary temperatures, and retains a large proportion of volatile hydrocarbons. Charcoal is produced from wood by a quick process, at high temperatures, and all of the hydrocarbons is eliminated. Lignite is very commonly formed by processes that are now, and have always been, active; in fact, it may be generally stated, that the moment woody tissue ceases to live, the process of lignitization sets in. Were the Bassick substance lignite, I could not object to its being derived as drift material from the surface.

The formation of charcoal demands exceptional conditions. Previous to the advent of man and his discovery of fire, I can conceive of but two natural processes that could produce it, viz: melted lava and conflagration produced by electric discharges. The former process would never yield drift charcoal. Lava would inclose most of the wood with which it came in contact, and whatever pieces of charcoal might be produced on the borders of a lava stream in a dense forest would not stand transportation in running water, but would rapidly be ground to the finest powder, because of its brittleness and friability. The possibility that charcoal may be produced by forest conflagration resulting from electric discharges, I will not deny. I believe it to be of comparatively rare occurrence, however. It must be considered as looking to a remote source for the Bassick charcoal. Such charcoal, furthermore, would not bear transportation with drift material, and we should not have explained the occurrence of charcoal imbedded *in* trachyte.

Newberry's theory fails, therefore, to account for the gradual transition of bowlder structure into solid country rock, and it is compelled to resort to peculiar conditions to account for the charcoal.

Grabill's Theory.

Mr. Grabill's theory may be called the "Geyser theory." According to Mr. Ewer, of the MINING AND SCIENTIFIC PRESS, it is also held by Mr. Smith, the Colorado State Geologist, and in fact may be said to express the popular view of the matter. According to this theory the present ore deposit has been the scene of action of a gigantic mineral spring, or boiling geyser, carrying the ore minerals in solution. The boiling motion of the water caused the fragments which fell into the geyser hole from the walls to be rounded and polished by grinding with much friction against one another; subsequently they were coated with ore by depositions from mineral solutions which continued to come up from below. Mr. Grabill confesses himself unable to explain how the separate bowlders were supported apart from one another while the ore shells were being formed about them. He explains the presence of charcoal near the surface by supposing that trees grew on the edge of the geyser hole, were undermined, fell in, carried into the depths, and there, by some mysterious process, converted into charcoal. The presence of charcoal five, six and seven hundred feet below the surface he considers a profound mystery.

Objections.

This geyser theory leaves many important features of the deposit unexplained. It does not attempt to bring into genetic relation with the ore body itself the gradual transition of the bowlder formation into the solid country rock. It confesses itself unable to account for the charcoal in the depths of the mine, and its explanation of that nearer the surface will not hold. It is simply inconceivable that charcoal could be produced under water at the temperature of a boiling geyser. Finally, we do not need the boiling and swirling motion of the geyser to account for the rounded bowlders.

Ewer's Statements.

The statements concerning the deposit collected by Mr. Ewer at Denver, and forwarded to the MINING AND SCIENTIFIC PRESS, are farthest from the truth of any yet made. They represent the bowlders as nearly spherical, and thoroughly water-worn fragments of all the rocks of the neighboring country, granite, porphyry, limestone, trachyte and sandstone, interspersed with loose sand, and with here and there a water-worn bowlder of pure ore.

This popular misconception of the character of these bowlders is founded upon the differences in color and texture produced by different stages of decomposition and disintegration of the *same rock*, a misconception that is all but universal in the minds of those who have not made the subject a careful study. Of course, any ideas of the genesis of the deposit founded upon such a fundamentally wrong premise must be far from true ones.

Rafter's Theory.

Mr. Rafter's theory is expressed in a few words, in the New York *Daily Graphic* for August 28, 1879. I should not advert to it were it not so close to what I conceive to be the true explanation. It is, briefly, this: The bowlders within the ore-body are of different rock from the trachyte forming the country rocks on the south and north sides. He considers both to be trachytes, but bases his distinction upon a difference in texture.

First an open fissure was formed. This was filled with a new trachyte, which solidified. Later disturbances fractured this second trachyte, breaking it into fragments of all sizes. Mineral solutions from below then rose through this fissured zone, corroding and rounding off the sharp, angular corners of the fragments, producing the bowlders, and depositing, simultaneously, the ore in concentric shells. Mr. Rafter makes no further statement concerning his theory; gives premises in no greater detail than I have here stated them in connection with his views; is apparently unfamiliar with many of the most important structural details, as developed subsequently in Mr. Grahill's paper; makes no mention of charcoal, the occurrence of which, perhaps, more than anything else shaped the views of both Newberry and Grabill; and finally, does not seem inclined to adhere very strongly to his own suggestions.

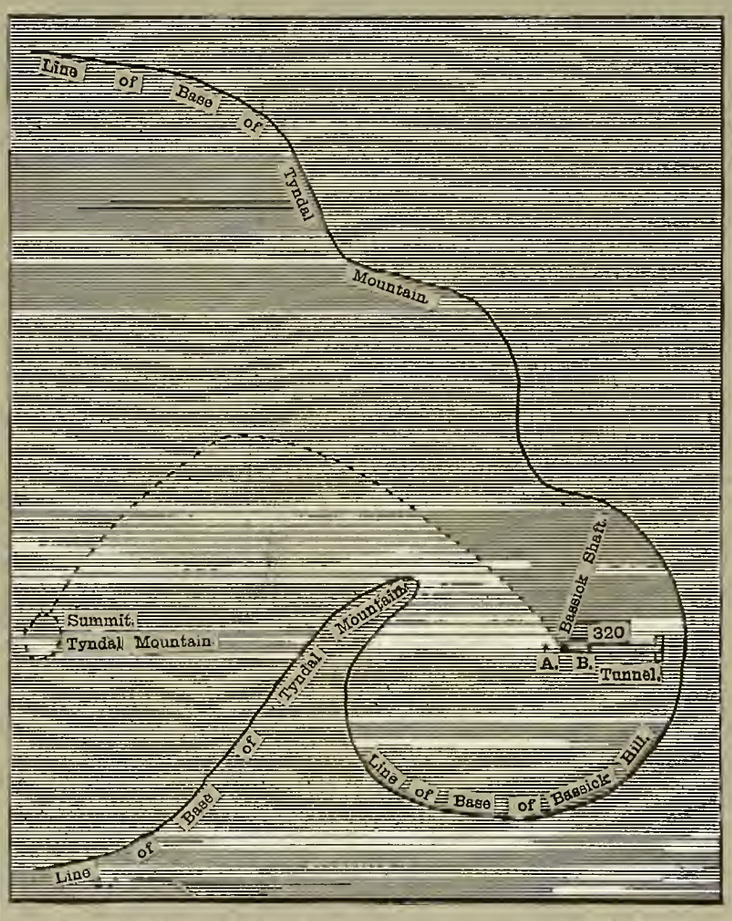

Fig. 3.—BASE LINE OF TYNDAL MOUNTAIN AND BASSICK HILL.

How remarkably close he came to what I conceive to be the true explanation, will appear upon the statement of my own views and the evidence upon which they rest.

Jackson's Theory.

I will first suggest an explanation of each of the more notable features of the deposit, and then sketch briefly the succession of events in the order in which they occurred resulting in the formation of the ore body as we now find it.

Charcoal.

First as to the charcoal, there can be no question that it is not *drift* charcoal, but that it was formed as charcoal just where we now find it. It resulted from an overflow of igneous fluid lava, over a surface covered more or less with vegetation. As I have already said, the formation of charcoal must be a rapid process, requires a high temperature, and exclusion of air. Precisely these conditions are realized when a fragment of wood is enveloped in melted lava. My specimen shows the charcoal actually imbedded in the lava, which could only have come about while the lava was plastic; and my microscopic examination of the rock, showing the presence of glass cavities in the feldspar, and the absence of liquid cavities, and the presence, furthermore, of glassy base, proves the rock to have been extravasated as an igneous, fluid mass, *i. e.*, at high temperature, and not as a volcanic mud. The charcoal is found both within and without the limits of the ore body. There is no genetic relation between charcoal and ore. How the charcoal at times comes to be completely imbedded in the ore sulphurets, I will explain when speaking of the deposition of the ore itself. The occurrence of charcoal at various depths from the surface to below 1,000 feet, may be explained in either of two ways: Either the trachytic mass has been built up by successive outpores of lava with sufficient interval between to admit of the formation of soil and a growth of vegetation, to be swallowed up and charred by the successive lava flows; or else the charcoal formed at or near the base of the first overflow was brought to the surface, inclosed in its original matrix by subsequent dyke eruptions. The data are not at hand for determining which is true or whether both may not have been operative.

The Trachytes.

Next, with respect to the bowlder nuclei. A satisfactory examination of the material at my disposal, even in thin sections under the microscope, is exceedingly difficult, in fact impossible, to carry out, owing to the fundamental decomposition which they have undergone. The open, porous texture of the trachyte has especially invited this decomposition, which in many specimens has gone so far as to reduce the whole rock to white, pulverized kaolin. The rocks can be properly studied only by tracing up in the field the fresh, normal rock. Such normal specimens were, unfortunately, not at my disposal. Nevertheless, I succeeded in satisfactorily distinguishing at least three varieties, and hence at least three independent eruptions.

The first variety is distinctly porphyritic, with sanidine-feldspar and hornblende crystals. (It is called "porpbyry" by the miners.) The latter are for the most part dissolved away and replaced by magnetite granules. Patches of the original substance remain in a few crystals, showing the pleocbroitic and absorption phenomena, as well as the oblique extinction of hornblende, while in one case an end section showed the characteristic angles of hornblende, viz: 124° 30′, and 117° 45′. (Observed: 125° and and 118° 30′.) I shall speak of this variety as the *porphyritic trachyte*.

A second variety is entirely compact in hand-specimens, shows no porphyritically disseminated feldspar or hornblende crystals, as in the preceding case. Under the microscope, however, their sections show exceedingly minute brownish needles plentifully disseminated throughout the ground mass. Their average size is about 0.018 m. m. long, and 0.001 m. m. thick, and from this down till they can scarcely be distinguished with the highest powers. The oblique extinction and scarcely perceptible pleochroism and absorption prove these needles to he hornblende. They are present in the ground mass of the preceding variety, but to nothing like the same extent. It is quite possible that these two varieties are from different parts of the same lava flow, representing only different conditions of cooling. No special significance attaches to the view that they are of different age. The fact could only he settled by further field investigation. I shall speak of this variety as the *compact trachyte*.

The existence and absolute independence of a third variety rests upon more satisfactory evidence than difference in texture or in composition. One of my specimens shows sharp cornered disintegrated fragments of the porphyritic trachyte and the compact trachyte completely imbedded in darker colored, fresher and harder trachyte. It is difficult to gain an exact conception of the composition of this third variety, as it is so completely filled with fragments down to microscopic dimensions of the other two varieties. Hornblende is absent from my specimens. It is sufficient for my purpose, however, if we can establish its igneous character and its younger age than the other varieties. Microscopic sections show it to be an igneous rock. With an enlargement of 530 diameters, one can just detect a more or less continuous network of brownish amorphous (isotropic) base lying between the minute crystalline granules that, with lower powers, appear to constitute the entire groundmass of the rock. This is a remnant of the original fluid rock magma, which solidified before it had time to differentiate into sanidine, hornblende, etc.

The inclosed rock fragments of the other varieties and their more advanced stage of decomposition, prove that they had not only solidified, but had had time to become considerably acted upon by disintegrating solutions before the third variety had been erupted. It is consequently the youngest of them all, and I shall speak of it as the *youngest trachyte*. It is to this rock the Bassick mine owes its existence. Mr. Grabill speaks of but a single trachyte. Mr. Rafter, by means of a difference in texture, distinguishes between two varieties, one of which he places entirely within the ore body, and the other entirely without it. I have shown the existence of three varieties of at least three different ages.

The porphyritic and compact varieties are both found within the limits of the ore body. I find no ore shells adhering to my specimen of igneous breccia, the cement of which is the youngest trachyte. Mr. Farish says of it simply that it comes "from the mine." It was probably taken just without the limits of the ore body, perhaps from the first tunnel run into the hill from the south.

Bowlder Structure.

Next, with respect to the bowlder structure. It commonly happens where an igneous rock has been forced through a superincumbent rock-formation to the surface, that the older rock is broken and crushed into sharp-cornered fragments, by the mechanical force of the eruption, for very considerable distances out into the mass of the rock from the line of greatest disturbance. As this distance becomes greater, the effect of the disturbance becomes less and less marked, and finally disappears altogether. Within this zone of disturbance the entire mass of the rock is converted into angular fragments, and the internal crushing is often so great as to grind the rock into very small fragments, or even, locally, into powder. Instances of this are so common in every extensive igneous region that it is unnecessary to mention special cases.

The fragments produced in immediate proximity to the outpouring lava will be mechanically inclosed in the fluid rock-matter, and will be retained in the solidified rock, forming an igneous breccia such as I have already described from the Bassick. Furthermore, fragments inclosed in such manner will be brought from below, and thus fragments of any deeply covered rock-varieties that may differ from that on the surface may be brought to the surface and mingled with the fragments of the latter in the same hand-specimen, as I have also described as occurring at the Bassick.

The sharp-cornered fragments thus produced may subsequently be rounded by the corroding action of the mineral solutions, which follow the eruption of the youngest rock. This also is a very familiar phenomenon. At the Sulphur Bank Quicksilver deposit in Lake county, Cal., rock fragments 'originally angular' have had all their irregularities rounded off by the action of the metallic alkaline solutions of sulphides which brought to the surface and deposited the cinnabar now found between the bowlders. And here as at the Bassick mine the bowlders of decomposition in place, were pronounced by the first observers to be of sedimentary or pluviatile origin. The parallel between the two deposits extends further still. As at Sulphur Bank, so at the Bassick, the decomposition below the waterline has been an alkaline and not an acid one, whence silica has been dissolved out of the rock and deposited largely in the interstices, as a siliceous gangue, while the silicate of alumina has been left as a residue in the form of clay, and this also we find between the bowlders, "Bassick tale," as the miners call it, often highly impregnated with sulphurets of the precious metal, assaying from $900 to $1,000 per ton. In this manner then the bowlders are produced, "bowlders of decomposition in place," and not bowlders produced by the action of running water such as we ordinarily see in river beds.

Ore Shells.

Next, as to the deposition of the ore in concentric shells around the bowlders. Mr. Grabill speaks as follows concerning this feature of the deposit: "One most peculiar fact regarding this deposit, and one which I am at much loss to explain, is that the nuclei or barren fragments are rarely tangent to each other, while the

(CONCLUDED ON PAGE 233.)

Wyoming Gold Fields.

Among the passengers on last Tuesday evening's train was Mr. J. M. Charles, of this place, an old and experienced miner, who for the past year has been prospecting for gold in the Wind River mountains, northern Wyoming, 125 miles north of Green River station, on the U. P. R. R. Mr. Charles says that the veins are all true fissures, carrying free-gold quartz in large bodies. The Bullion lode, one of the richest and largest of the district, is thirty feet between walls at at its present depth of 50 feet, as has been demonstrated by crosscut drifts. The ore is free-gold and resembles the celebrated Homestake ore in the Black Hills, and averages from $10 to $50 per ton. The Anaconda is the east extension of the Bullion, and is owned by Mr. John Charles. At a depth of 30 feet, a six foot crevice with pay interspersed throughout was disclosed. The Overland, another of Mr. Charles' lodes, looks very promising at 30 feet. The Wolfe, 1,000 feet north of the Anaconda and Bullion, and parallel with them, is a tremendous vein. It prospects well, running as high as 25 to 50 cents to the pan. There are many others equally as good.

The country is not all staked off and taken up as in many other camps, but there is plenty of room for all who may wish to invest in most excellent prospects, which, with development, will undoubtedly prove bonanzas. There is but one mill, and that is at the Bullion mine. It has ten stamps and treats 18 tons per day. This little mill makes $600 a day. It and the mine are running steadily day and night.

The great want of the camp at the present time is proper mills for treating the ore, and some capital; with these, Mr Charles says, it will be a glorious camp, and one of the richest and largest ore producers in this western country. He will return in the spring and open up his claims on a grand scale.—*Georgetown Courier.*

Arizona Copper.

The Clifton *Clarion*, in an article on the probable future of the copper mines in that locality, their handsome returns to their owners, and of the several promising mining districts in that section, expresses the belief that the copper bullion output will be trebled in another year. That the *Clarion* has good grounds for the prediction, we have not the least doubt. Globe is another permanent camp that will increase its yield of copper bullion. Good reports also reach us from Ray Camp, where they are taking out native copper in considerable quantities, aside from ordinary ore. The Copper Queen, which up to this date has surpassed all other copper mines in Arizona in the quantity of bullion produced, continues to yield all the ore that the smelters can make use of. There are also some fine copper mines in the southeastern corner of Yavapai county, which ere long may be expected to contribute their portion of copper bullion in Arizona, having in sight enough ore to keep a thirty-ton smelter running four years, to say nothing about further developments. We have no doubt that the yield of copper bullion from Yavapai county, in the region of Prescott, will be greatly increased, now that the Atlantic and Pacific railway has been extended through the county. Copper mines exist in every county in the Territory, and the annual increase must be rapid and permanent.—*Tucson Citizen.*

Novel Prospecting Shaft.—From a Mr. Jackson, an old resident of the Comstock, who has been visiting in Plumas County, California, for the past year, the Reno *Gazette* learns that a novel prospecting shaft is being sunk in American valley, near Quincy. A tube of boiler iron four and one-half feet in diameter is being sunk, and is now down 228 feet, inside of which an immence plunger, weighing 1,800 pounds, with a nose or point of steel, loosens the earth, which the plunger receives through a valve, and when filled is hoisted to the surface. Whenever boulders are encountered the machinery is removed from the shaft and the miners go down and blast them out. This company, which is an Eastern one, and managed by a man who has had a large experience in the Lake Superior copper mines, and in the oil regions of Pennsylvania, by the name of Mills, except to find a rich deposit of gravel, and the material being taken from the shaft, or tube, seems to justify the belief that such a deposit exists in this vicinity. This method of prospecting for gravel mines is something new, and the result will be watched with great interest by all miners.

A Great Mine.—The gold quartz mine in Venezuela which H. C. Perkins recently left this county to take charge of as superintendent is named the El Callao. It was originally worked as a placer mine, the surface abounding in auriferous gravel of a high grade. Operations have been carried on there for a quarter of a century past. There are no drifts or tunnels, but the ore is quarried out, leaving a pit that is now about 500 feet deep. Although the workings are now lower than sea level, and a large river courses through the locality, no trouble is experienced with water, which fact causes surprise among mining men. Last year the El Callao produced about two million dollars worth of bullion, the expenses being about one million dollars. The ore pays something like $100 a ton. The owners want to reduce the working expenses, and they have no doubt secured the right man in Mr. Perkins to inangurate a more economical management.—*Nevada Transcript.*

Useful Information.

Workshop Notes.

A varnish compound of 120 parts of mercury, 10 parts tin, 20 parts green vitriol, 120 parts water, and 15 parts hydrochloric acid of 1.2 specific gravity, furnishes a good coating for iron exposed to the wet.

Among the advantages resulting from having dry bearings running coolly and smoothly are saving in power and in time, increase in capacity of machine, quiet, freedom from dirt and grease, saving of bills for lubricating material, freedom from loss from stoppages, etc.

To make gum for thick labels, dissolve one pound of gum arabic in one quart of cold water, and strain through flannel. For chemists' labels, take one pound of gum arabic and dissolve it in three pints of cold water, add one tablespoonful of glycerine and two ounces of honey; strain through a flannel, and apply with a piece of Turkey sponge, which will last in constant use three or four months—common sponge goes to pieces almost directly; lay the sheet to be gummed on a flat board, and gum over evenly.

A lacquer of elasticity, perfectly supple and not liable to peel off, is made in the following manner: about 120 pounds of oil varnish is heated in one vessel, and 33 pounds of quicklime is put into 22 pounds of water in another. As soon as the lime causes effervescence, 55 pounds of melted India-rubber are added. This mixture is stirred, and then poured into the vessel of hot varnish. The whole is instantly stirred, so that the ingredients may become thoroughly incorporated. When required for use it is thinned with the necessary quantity of varnish, and applied, hot or cold, to wood, iron, walls, water-proof cloth, paper, etc.

Silver may be kept from tarnishing by painting it with a soft brush dipped in alcohol in which some collodion has been dissolved. The coating can be removed by dipping the article in hot water, but it completely protects it from tarnish.

To stain cherry in imitation of mahogany, digest logwood chips in vinegar or acetic acid for twenty-four hours or more. When ready to use, heat the solution, then dip the wood until the suitable color is obtained.

Chimes of Bells.

Knight's Mechanical Dictionary says: "The making and arrangement of a suit of bells to constitute a perfect chime is a matter of considerable difficulty. The tone of the bell depends conjointly on its diameter and thickness, a small or thick bell yielding relatively a more acute sound than one which is larger or thinner, owing to the greater rapidity of the vibrations of the metal. The founder endeavors to regulate the diameter and thickness so as to produce a certain note in each bell of a set of chimes; but as this is difficult to be attained by the mere operation of casting, it is generally necessary to remove some of the metal afterward, to produce a perfect note, by either reducing the diameter at the lower edge when the note is too low, or reducing the thickness of the part struck by the clapper when too sharp." Spon gives the method of finding the key-note of a bell, when the diameter at the mouth and the thickness at the sound-bow (that part of the bell near the mouth which receives the blow of the tongue), are given as follows: Multiply the sound-bow thickness by 58,000 and divide by the square of the diameter. The answer is in vibrations per second. For example, the key-note of a bell with a diameter of 44 inches, and sound-bow 3.52 inches thick, is found by multiplying 3.52 by 58,000 and dividing the product (204,160) by the square of 44 (1,936); the quotient, 105.45, is the number of vibrations per second, which corresponds nearly to the note A in the first octave below zero in the bars.

Artificial Wood.—A German named Herr B. Harrass, has (it is said) discovered a new method of making artificial wood, which is likely to prove of considerable service to all manufacturers of fancy goods. Common cellulose in paper form is reduced to pulp in water, and after being strained, three parts by weight of starch and two parts of wheat or maize meal are added to it. The compound is then boiled over a water-bath in thin metal tubes, which it leaves in the form of a liquid glue. Now sawdust is added, and the whole is dried in a hot room and set to the consisteney of wood. Any shapes can be made by the aid of molds and great pressure; and any color, polish, or veneer can be imparted. It is the old patent coal and rock asphalt principle over again; and we should think could be developed to almost any extent, as the compound may be required to leave the molds all ready for the most delicate and artistic uses.

Qualities of Flour.—The color of flour delivered from rolls differs greatly from that produced by buhrs, and the cause is easily found if one closely studies the construction, mode of operation, and arrangement of machinery in the mill in which it is made. Experience shows that rolls moving at differential speed produce yellower flour than those whose motion is equal. The same principle prevails with millstones, for with well ventilated sets of buhrs, whiter flour is made than with those which run with much heat. One need not, however, exclusively attribute the difference in the whiteness of flour to the continuous and injurious heat engendered in grinding, but it depends in a measure on the quantity of middlings made, if not more, perhaps, on the bran bolted therefrom. The nutritive value of a flour depends not so much upon the kind of milling which produced it as it does upon the quality of the grain, the arrangement of machinery in the mill, and the manipulation of the miller. The better and more perfectly the grain is cleaned, so much the more is the flour free from foreign matter, and it is the more nourishing. That the flour product of rolls is whiter than that of buhrs is beyond cavil; my theory is, that, without doubt, its nourishing properties are also greater, for it is most true that the flour is freer from bran than when made on buhrs.

Sensitiveness of Infants. Dr. Gedzmer states that the sense of touch is present in infants at birth, although the faculty of feeling pain is slowly developed, and is clearly indicated only after the child has reached the age of four or five weeks; smell and taste are not distinguishable in the first, or, at latest, the second day of life; light is quickly perceived immediately after birth, but evidences of complete visual power do not appear for four or five weeks, and it is only after four or five months that colors are clearly distinguished.

Patent plastering was a novelty exhibited at a recent building exhibition held in London. It is claimed for it that it saves both time and labor. The material is prepared beforehand, in slabs which are fixed to the joists direct, with great speed, forming the ceiling at once. Thus, plastering that would occupy weeks to execute, can be accomplished by this slab system in as many days.

Dr. Venukoff, during his late journey in Central Asia, discovered the horse, the camel and the goose in their wild state. No alarm was shown by some of their number after others of their associates had been shot.

Good Health.

Sleep.

It is scarcely possible for the brain-worker, the delicate and nervous to sleep too much. Indeed I do not know what special harm could result to these classes, though the heavy, dull and naturally stupid might become more indolent and inactive, in consequence of an unnecessary amount of sleep. The former classes "work on nerve," or are constantly under the influence of excitement—are running the human machine on the "high pressure" principle, always at a great disadvantage. But the "wear and tear" of life, from whatever causes, find an alleviation in good and refreshing sleep. Indeed, it is the mission of sleep to soothe the excited nerves, to aid in restoring the jaded body and to resuscitate in general. It is during natural sleep that nature performs her most beneficent work in the removal of disease, while it is as true that the grand work of consolidation then proceeds untrammeled, the solidification of the blood—made from our food and intended for general repairs of the body—into the tissures.

It is utterly impossible to determine the precise time to be spent in sleep, the age, temperament, sex, employment, manner of life and habits of diet being so various. It is said that John Wesley was able to perform an immense amount of mental labor, living very abstemiously, and yet slept but about four or five hours daily, but it is probable that very few would survive ten years of such labors with that amount of sleep, if the usual style of living should be adopted.

Among the animals it is known that a wide difference in the sleeping habits exists. The herbivorous, sleeping at night and living on a bland food, sleep less than the carnivorous. Though the herbivora are more hardy, are longer-lived, stronger or more enduring, they demand less sleep, are less exhausted by active effort, demanding less recuperation than the carnivora.

It follows that those who stimulate, either by food, by the exciting articles of the castor or by ardent spirits, implying a corresponding waste of vital energy, demand much sleep as a means of restoring the poise of the system or of regulating its action. The frail female, if nervous, those subject to unusual cares, anxiety, excitement, annoyances, etc., so generally succeeded by depression, with all real brain-workers as clergymen and the like, demand an unusual amount of rest and sleep, and sleep under favorable circumstances. One important condition is that it be secured at night, and, as far as practicable in the early part of the night, when the birds secure theirs, though it may not be strictly true that "one hour before midnight is worth two after." Another is that the sleep shall be undisturbed, implying quiet, darkness, and an empty stomach, or the "periodical suspension of all of the functions of external relation." It is a state of rest, rest of the body as a whole, the stomach included, and of the body, a dreamless sleep. The half sleep or dozing in the morning or that disturbed by harassing dreams, either from gluttony or undue excitement, not only can not refresh one really, but must prove more or less depressing. To secure real sleep it is well to take a very light and plain supper, such as will digest before the hour of retiring.

Dr. Hall says that a single slice of bread and butter and a cup of weak black tea are enough for an ordinary person. I should recommend, instead of even weak tea, none, a cup of cocoa, or still better the cocoa shells, a good nervine, are preferable. If the tea aids one in keeping awake while watching, it is evident that it does so by irritation, and that if we would secure the best sleep it may safely be omitted, at least at night. Instead of the bread, a light oat-meal mush, or that made of "granulated coarse wheat," resembling the crushed wheat," would be an improvement, while all pastry difficult of digestion should be discarded, by those at least needing much sleep.—*Dr. Hannaford, in Golden Rule.*

Austrian Mud Baths.—This is the *modus operandi* of a mud bath in Austria, according to the correspondent of a contemporary medical journal. We are going to see the baths in a few days, and will observe whether the description is correct: "Here in Austria they excavate a marsh where decaying vegetable mold and water is in abundance, cart it to the bath-houses, grind it in a mill, and pass it into a large tank, where it is mixed with water and heated by steam. From the tank it is drawn off into portable bath-tubs, where it is again mixed, more water added, and the temperature brought to the desired grade. Then it is wheeled into the bath-room, and the unfortunate bather plunges into a black, bad-smelling mixture, where he remains from twenty minutes to half an hour, when he steps into a second tub, full of pure water, to cleanse himself. The mud is too precious to be wasted, so, after being used, it is deposited in a great heap, where it is said to remain ten years before it will be fit for use a second time. These heaps remind us in more ways than one of those which the dairy farmer accumulates behind his cow stable. The mud bath is popularly believed to be very beneficial in all cases—a veritable cure-all. The physcians questioned on the subject were unwilling to commit themselves as to its indications and effects, except in the case of hypochondriacs, with one exception, and he said where a poultice for the whole body was necessary he knew of no more convenient method of applying it."

Sewer Gas and Typhoid Fever.—Dr. Geo. Hamilton, in the *Medical Record*, takes issue with those who assume the conveyance of germs of typhoid and scarlet fevers, diphtheria and dysentery by contaminated drinking water, and who do not believe that sewer gas can spread the infection or originate the diseases. Referring to the epidemics that sometimes occur suddenly in cities fed with drinking water from some common source, he says that their sudden appearance and as sudden disappearance can not be attributed to the character of the water, except on the supposition that the water changes suddenly from purity to impurity, and *vice versa*, a supposition incompatible with the delivery supply of water from reservoirs. Walled-up cesspools, he says, are common in the city, and not usually found in the country, and the exhalations from unventilated and uncared-for vaults have much to do with the prevalence of typhoid diseases.

Transfusion of Blood.—The *Presse*, of Vienna, lately described an operation of the above kind successfully carried out by Professor Nothnagel in conjunction with Herr Ritter von Hacker. On account of the unsatisfactory results recently obtained in several cases by using human and lamb's blood, it was resolved to try a better method, already suggested by several physiologists. This consisted of a solution of common salt of .6 per cent. rendered alkaline by two drops of concentrated solution of soda. The patient treated on this occasion was a young man who was in imminent danger from weakness of the heart, consequent upon loss of blood by reason of an abscess in the stomach. An incision was made in a vein in the upper part of the arm, and by means of a funnel-shaped receptable about two pints and three-quarters of the fluid in question were introduced into the system of the patient, who is now expected to recover.

Hot Water and Beef.—A writer in the New York *Tribune* sounds the praises of hot water and chopped beef as a wholesome diet. The chopped beefsteaks are made from the most tender and juicy part of the round, chopped in such a manner as to separate the nutritious part from the tough cellular or fibrous structure that contains it, and which forms more than one-third of the substance. This pulp is carefully removed with a spoon and lightly formed into a cake of the thickness of an ordinary beefsteak, broiled and seasoned with salt, pepper and other condiments. This is pronounced perfectly digestible, and far more delicious than a fillet steak. Two glasses of hot water taken an hour and a half before eating, and a diet of this beef, will, it is said, give the most incorrigible dyspeptic new views of life.

Effect of Brain Work on the Teeth.—The French medical journals have recently been discussing the relation of the teeth to the brain, and their conclusions are of considerrble importance to all brain workers. It seems to have been clearly established that excessive and prolonged mental labor causes the teeth to decay by consuming the phosphates which would otherwise nourish the dental structures.

TABLE OF CONTENTS.

EDITORIALS.—A New Virgularian Zoophyte; An Improved Lubricator; International Electric Exhibition; A New Prospecting Machine, 225 Passing Events; Mineral or Non-Mineral Lands; Alum, Tellurium and Ozocerite; New Dry Gold Separator; Early History of the Comstock, 232. Blasting in Mines, 233.

ILLUSTRATIONS.—Conway's Lubricator; Prospecting Machine, 225. Bass Line of Tyndal Mountain and Bassick Hill, 230. Cross-Section of the Bassick Mine, 233.

MECHANICAL PROGRESS.—Coke Driving out Anthracite; Band Saw Blades; Asphalt Mortar; Care of Machines; Length of Boiler Tubes; Novel Naval and Siege Guns; Loss of Heat; Paper from Soap Weed; Complicated Machines; Trap-Doors in Car Roofs; Spiral Springs, 227.

SCIENTIFIC PROGRESS.—Man and Insects; Reptiles in Disguise; Storm Sounds in Telephones; Earthquakes and Outbursts of Gas in Mines; The Effect of Lightning on Trees; Testing Oils; A Substitute for Quinine, 227.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 228.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 228-29.

USEFUL INFORMATION.—Workshop Notes; Chimes of Bells; Artificial Wood; Qualities of Flour; Sensitiveness of Infants, 231.

GOOD HEALTH.—Sleep; Austrian Mud Baths; Sewer Gas and Typhoid Fever; Transfusion of Blood; Hot Water and Beef; Effect of Brain Work on the Teeth, 231.

MISCELLANEOUS.—On the Structure and Genesis of the Bassick Ore Deposit, 226. Wyoming Gold Fields; Arizona Copper, 231.

NEWS IN BRIEF—On page 236 and other pages.

Passing Events.

A week of fine sunny weather marks our October days, and causes us all to delight in our California climate. An earthquake has greeted us, too, which is not unexpected in October. All fear of yellow fever contagion is over, the offending steamship having been fumigated and everything done to the satisfaction of the health officers.

News from the north tells of the discovery of a very large river emptying into the Pacific, and second only to the Yukon. Down this latter, by the way, Lieut. Schwatka has come on a raft 1,800 miles. Lieut. Ray's expedition from the Arctic has returned here all well. The miners from up the Yukon report poor luck when the character of the country is considered.

Prospectors are beginning to come in from the mountains and take up quarters in the town for the winter. The debris suit is still going on in this city. There is little of note from the various mining districts.

THE NEVADA BORAX FIELDS.—The Walker Lake *Bulletin* says: The largest supply of borax in the world is in this county, partly on the line of the Carson and Colorado railroad, and partly in Fish Lake valley and Columbus basin. From some of the marshes the cotton-balls are shipped to Europe to be worked. At most, however, the borax is manufactured on the ground. There are three large works near Columbus, which, when in operation, can turn out about six tons daily. In addition to these there are five smaller establishments that together can make two tons daily. The large mills are closed at present, as they have a great quantity on hand, but the small places are steadily at work. From Rhodes' marsh the raw material is nearly all shipped to Liverpool, and Gray & Turner, near Columbus, are making preparations to ship to the same place. They sent samples off last Saturday.

Mineral or Non-Mineral Lands.

A few years ago the Overman and Caledonia mining companies, on the Comstock lode, desiring to sink a deep shaft at a point about 4,000 feet to the east of their claim, so as to reach the lode on its dip at the requisite depth, attempted to obtain possession of three certain tracts of land. Two of these tracts were in conflict with the Yankee claim, in Gold Hill district, located April 21, 1876. This Yankee claim applied for a patent December 10, 1878, and two adverse claims were filed by the Overman and Caledonia companies respectively, during the period of publication.

The two companies, in order to get possession of the land, filed a petition in the District Court to have it condemned, alleging the non-mineral character of the land. The Yankee people alleged its mineral character. At the trial, after an abundance of testimony, the court decided that the land was non-mineral; and upon further finding the necessity for the use of the land by the two mining companies, judgment was rendered in favor of the condemnation. The case was appealed to the Supreme Court of Nevada, but the judgment of the lower court was affirmed.

A feature of the case was, that in the suit brought upon the filing of the adverse claim, the complaint set forth the idea that the determination in respect to the mineral character of the land was binding on the defendant. In their answer, the defendants averred its mineral character, and offered to prove it. But the court held, the determination of that question in the condemnation suit was conclusive between the parties, and excluded the testimony.

The Commissioner of the General Land Office, when the matter came before him, said the Yankee claimants had had no opportunity, except in the condemnation proceedings, to show that the land in controversy was subject to exploration and purchase, and that he "must hold that the law has cast upon the executive department the duty of disposing of the public land, and, as a necessary incident, the authority of determining whether certain tracts are subject to sale under certain laws." He therefore ordered a hearing to determine the following points, viz.: 1. Whether the land is valuable for mineral deposits. 2. If so, whether the Yankee location is a legal one.

A hearing was held and testimony taken; and all the testimony in the condemnation trial was also submitted, as well as that in the adverse claim trial. The Land Commissioner decided the matter by dismissing the application of the Yankee Company, and they appealed to the Secretary of the Interior. He has just given his decision.

The only thing the Secretary of the Interior had to consider was, whether the Yankee claim contained a vein or lode bearing minerals. He concluded that the testimony bearing on this question in the cases had been carefully considered. During the hearing ordered by the Commissioner, the judge who presided at the condemnation suit trial was called as a witness, and testified that he had had large experience in trying mining cases in the district; that he went upon the ground and into the shaft, and made a personal examination of the claim in respect to the mineral-bearing qualities, before rendering his decision. The decisions of the District Court and of the Supreme Court and of the Register and Receiver of the district, all agreed that the Yankee claim contained no valuable mineral or lode. The Commissioner of the General Land Office so decided; and the Secretary of the Interior finally has arrived at the same conclusion.

Perhaps, however, the most practical proof of this fact is, that since the Overman Company entered on the land in 1878 a deep shaft was sunk on the ground in controversy at an expense of some half million of dollars, and no mineral-bearing rock has been found. The Secretary of the Interior incidentally mentions this apparently unimportant fact in his decision, and, perhaps facetiously, adds: "Taking into consideration all the testimony in the case, and giving it due weight, it clearly establishes the conclusion before stated. The decision dismissing the application for patent is therefore affirmed."

It will be seen from this that the law's delays sometimes are advantageous in proving that the law is right. A mass of testimony, costing much money, was taken by the law to prove a certain point, and five or six years' time was used up. Meantime the miners were at work finding out the same thing. It was too bad the Secretary could not have decided the question without that shaft having to be sunk to prove there was no mineral there. It would have been a great saving. As it happened, however, the sinking of the shaft proved the department's theory was right; so there is some comfort in that. It is not often that the officer to judge of a point can have the matter practically decided for him before he commits himself on the subject.

New Dry Gold Separator.

There are several forms of dry gold separators, as they are called, which operate by blowers or fans, or the action of percussive blasts of air. A form of these useful machines has just been patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, by S. C. Chaney, of Chico, Butte Co., which is essentially different in operation from any heretofore designed.

Through suitable pulleys, belts and a power device, motion is transmitted to revolve certain conveyers, and a fan blower. The conveyers are hollow cones, the open ends of which open into a smoke-stack. A fire is started on the grate bars under the conveyers. The suction of a fan causes a draft through the grate bars, and also through both conveyers. The draft carries the flame with it through both conveyers. The auriferous earth, sand or quartz is fed into a hopper, and goes through the upper conveyer. It passes down the inclosed portion of the upper conveyer and drops through a passage, where the large rocks are caught on bars, and then into the lower conveyer, which inclines the other way and carries it back again. Here it drops into still a third conveyer, which discharges it, the larger portions falling out at the end, while the smaller pass through perforations and are caught separately.

In its course through these conveyers the material is gradually concentrated by increase of the opposing draft, which carries off the very light dust through the stack. The fire dries it thoroughly, causing a good separation and permitting it to crumble. It is only the heavy concentrative material which finally passes through into the last conveyer. This last one is not subjected to the fire, and in it the concentrations are cooled.

Within the two upper conveyers are provided arms carrying heavy weights or hammers, which in the revolution of the conveyers fall down upon and crumble the material. Means are provided for cutting off the flame from the conveyers when necessary. It will be seen that the combination of heat with the draft is the essential feature of this machine. The method of crumbling is also peculiar.

Regulations Under the Mining Laws.

On October 31st, 1881, the General Land Office issued a circular to Registers and Receivers, entitled, "United States Mining Laws and Regulations Thereunder." These we published in full at the time, as they are of great interest to the mining community. Additional regulations have been promulgated amendatory to to that circular, which, except as modified by these, remain in full force. The following are the new regulations:

1. No application will be received, or entry allowed, which embraces more than one lode location.

2. A party who is not an applicant for patent under section 2325, revised statutes, or the assignee of such applicant, is not entitled to make entry under said section, and in no case will the name of such party be inserted in the certificate of entry. This regulation has no reference to proceedings under section 2326.

3. Any party applying to make entry as *trustee*, must disclose fully the nature of the trust and the name of the *cestui que trust;* and such trustee, as well as the beneficiaries, must furnish satisfactory proof of citizenship; and the names of beneficiaries, as well as that of the trustee, must be inserted in the final certificate of entry.

4. Where an adverse claim has been filed and suit thereon commenced within the statutory period, and final judgment determining the right of possession rendered in favor of the applicant, it will not be sufficient for him to file with the Register a certificate of the clerk of the court setting forth the facts as to such judgment, but he must, before he is allowed to make entry, file a certified copy of the judgment, together with the other evidence required by section 2326, revised statutes.

5. Where such suit has been dismissed, a certificate of the clerk of the court to that effect, or a certified copy of the order of dismissal, will be sufficient.

6. In no case will the relinquishment of the ground in controversy, or other proof filed with the Register or Receiver, be accepted in lieu of the evidence required in paragraphs 4 and 5.

7. Where an adverse claim has been filed, but no suit commenced against the applicant for patent within the statutory period, a certificate to that effect by the clerk of the state court having jurisdiction in the case, and also by the clerk of the circuit court of the United States for the district in which the claim is situated, will be required.

8. Possessory title to a lode claim held and worked for a period equal to the time prescribed by the statute of limitations for mining claims of the state or territory where the same may be situated, may, in the absence of any adverse claim, be established in the same manner as now allowed in placer claims, and indicated generally in paragraphs 67, 68 and 69 of the circular hereby amended.

9. No entry will be allowed until the Register has satisfied himself, by a careful examination, that the proper proofs have been filed upon all the points indicated in official regulations in force, and that they show a sufficient bona fide compliance with the laws and such regulations. A strict observance of this regulation will be required.

Alum, Tellurium and Ozocerite.

On this coast there are many minerals which we do not consider of economic value—not because they could not be sold if mined, but because the conditions are not right to work them. They may occur associated with other minerals, or in such a shape that we have not had the requisite experience to make them pay. Among these is

Tellurium.

Though not very abundant, tellurium can hardly be called a rare metal in the Pacific division of the United States, having been found at several localities in California and reported elsewhere in this region. The principal deposits of this metal, so far as discovery has gone, are at the Meloues mine on Carson Hill, in Calaveras, and at the Raw Hide and Golden Rule mines in Tuolumne County, California, where it is found in combination with gold, silver, sulphur, etc., many large and exceedingly rich samples of the telluride of gold having been taken out of these mines. Tellurium has also been found under like conditions in Utah, but the extent and value of the deposits there remain undetermined.

Alum.

This mineral exists in the form of an efflorescence on argillaceous rocks in the Silver Mountain District, Alpine County, California. But the deposits here are too light to be of much practical value. In the early part of 1875, the discovery of what was termed an alum lode was reported to have been made on Howell Mountain, Napa County, California. As is often the case with these reputed finds, much was claimed for the extent and purity of this deposit; but as very little alum from that locality ever found its way to market, these first accounts of this discovery were presumably much exaggerated. Some of the springs of the Geyser group, Sonoma County, also small springs near Owen's Lake, carry a small percentage of this mineral. Certain clays found in Santa Clara and Calaveras Counties, show a strong taste of alum; but if any valuable deposits of this mineral have ever been found in the Pacific Coast, the fact has not become generally known.

Ozocerite.

Ozocerite was discovered in Southern Utah during the summer of 1877. This find was considered so valuable that a company having their headquarters in Boston was formed the next year for working the deposit, which has since been worked quite extensively and with some profit. The crude material is said to be of good quality; samples sent to England to be tested having been pronounced equal to the best Turkish article. Other samples analyzed in San Francisco were found to contain a large percentage of white wax, of the kind used in making paraffine candles. This substance can be mined and delivered in Boston at a cost of four cents per pound.

NOTE.—India rubber erasers are often hard, and in this condition, instead of erasing a pencil mark in a cleanly manner, convert it into a smudge. To render such an eraser useful, soak it for a few days in ammonia. C. H. A.

MINING STATISTICS.—By laborious statistics running through thirty years in the United States, from 1850 to 1880, from a large list of mines reported, it is shown that while $700,000,000 have been expended on mines of gold, silver and lead, these mines have returned $2,200,000,000, being 300 per cent profit in cash.

THE Director of the Mint authorizes the purchase of 410,000 ounces of fine silver for use at the Philadelphia, New Orleans and San Francisco Mints.

The Bassick Ore Deposit.

(CONTINUED FROM PAGE 230.)

shells surrounding them are so tangent. Where we should reasonably expect to find actual contact between the bowlders themselves, we frequently find instead at the point of approximate contact two separate shells of ore between them, one belonging to each nucleus, thus showing that, although the similar coatings upon the different nuclei must have been deposited at the same time, the fragments could not at that time have been in contact. What supported them during the period when the coating was taking place seems to be as much of a mystery as was to the ancients the base on which Atlas stood."

And such a mystery it would remain if we supposed, as Mr. Grabill evidently does, that the *inner* shell was the first deposited, and that those following successively toward the exterior were deposited successively, the outer coat being the last of all. As a fact, just the reverse took place. The *outer* coat was formed first, and the inner coats successively followed toward the center, space for each succeeding coat being obtained by the gradual solution of the trachyte. The alkaline solutions bringing the metallic sulphides for silica simply exchanged the metallic sulphides for silica and silicates of the alkalies and alkaline earths contained in the trachyte, mol ecule for molecule, and thus a veritable "pseudomorph" of ore after trachyte bowlder was produced. This process might go on until the entire nucleous was dissolved and replaced by ore, and such "bowlders" of ore have actually been found in the mine.

There is nothing unusual about this formation of concentric layers of mineral matter by successive depositions toward the center. Precisely the same thing is seen in the formation of amygdules in the cavities of igneous rocks. Chalcedony amygdules usually consist of many concentric layers, not infrequently lined in the center by quartz crystals with their crystalline facets projecting inward. Sometimes we can discover a definite channel through which the solutions make their way inward. At other times, none such exists, and we must suppose a process of gradual exusion of succeeding coats through those already formed. Either, or both of these processes has been operative in the case of the Bassick bowlders, and thus the whole mass has been solidly supported throughout the entire period of formation.

Barren Bowlder Zone.

The last feature, to which I shall especially advert is the existence of the barren zone of bowlders upon both sides of the ore mass, and between the ore mass and the solid trachyte, to the north and south of the deposit. Why is the ore found near the center of the bowlder zone, and not immediately adjacent to the solid rock? Mineral solutions circulating through the rocks always follow channels of least resistance. Given such a case as we have before us, where an igneous rock has broken through superincumbent rocks, crushing and fracturing them along the line of disturbance, such a channel of least resistance will be formed near the center of the crushed zone and not near either of the solid rock masses, for the fragments of the older rock near the contact with the younger eruptive, will be cemented together by the solidified rock magma of this later rock which will permeate, while in a fluid state, a certain distance among the fragments; while on the opposite side of the zone of disturbance the rock will gradually become more compact, owing to the increasing distance from the seat of mechanical disturbance. If the supply of metallic solutions were unlimited, the whole brecciated zone would become filled with the metallic deposit. If limited, as in the present case, the heaviest deposition of ore would take place along the center of the channel pursued by the solutions in their upward course, and from this center outwards in both directions, the thickness and number of coats would gradually diminish and finally disappear altogether.

I have given now my explanation of each of the peculiar features of this very interesting ore deposit. The other problems connected with it are such as are common to all deposits of metallic sulphides, and will not be considered in this connection.

General Statement of Theory.

I will recapitulate in a few words and in their natural sequence, the various processes resulting in the formation of the Bassick ore deposit. First, and as an isolated instance of what took place at about the same time, all over the Cordillera system, occurred the eruption of the porphyritic trachyte, and the compact trachyte, probably in many successive outpours from one or more local sources, building up a mass of eruptive material, over 1,000 feet thick and resting immediately on the Wet Mountain granite. The first and perhaps subsequent eruptions were poured over surfaces more or less covered with vegetation. The woody material thus enveloped became converted into charcoal through the high heat of the lava, and exclusion from air by being enveloped in the liquid material.

Subsequently a third variety of trachyte was forced up through the others in a liquid condition, fracturing them in the neighborhood of its upward course, penetrating some distance in among the fragments and cementing them together into an igneous breccia. Fragments of underlying varieties containing possibly charcoal were thus brought towards the surface. Following this eruption, came alkaline solutions containing metallic sulphides which found their way to the surface through the brecciated zone produced by the last eruption. These alkaline solutions at once attacked the angular fragments between which they circulated, rounded off their sharp angles and edges, deposited in the spaces between the bowlders thus formed, and concentrically around each bowlder, one or more shells of ore, depending upon the supply of mineral solution immediately at hand. When more than one ore shell was deposited about the same nucleous, the outer shell was formed first, the others following in order towards the center. In some cases the entire nucleous was dissolved out and replaced by ore.

Any fragment of charcoal inclosed in the trachyte bowlder was left untouched by the alkaline solutions, which, however, dissolved away the surrounding trachytic material, replacing it with ore, leaving thus the charcoal completely imbedded in ore. The silica dissolved out of the trachyte was, in part at least, deposited as a siliceous gangue between the bowlders, sometimes also within the pores of the charcoal forming silicified charcoal.

The kaolin left as a residue after the total destruction of the trachyte was deposited between the bowlders.

All of the trachyte for some distance either side of the deposit was strongly decomposed by the combined action of solutions from below, and of superficial circulating waters, determining thus the various shades of gray, pink, and white which have misled most observes into the belief that many kinds of rock were present among the bowlders.

A practical consideration of the highest importance is the extent, the continuity of the ore body. This depends upon the form and extent of the youngest trachyte. If this is a dyke eruption, the ore is liable to be continuous horizontally, or, discontinuous bodies of ore similar to the Bassick are liable to occur in a horizontal direction so long as the youngest trachyte holds out horizontally. If this trachyte is not a dyke eruption, but has come up through a more or less cylindrical opening, like the throat of a volcano, then the deposit will be of a restricted horizontal extent. In either case it will extend indefinitely downward, behaving in this respect like an ordinary fissure vein, of which class of deposits it is indeed but a variety modified in character by the local conditions attending its formation.

It is with considerable hesitation that I have prepared this paper concerning a geological problem which I have never been able to study on the spot. The opinion of observers who have had the opportunity to examine the local conditions, have seemed to me so fundamentally erroneous (if we except Mr. Rafter's), and have surrounded the deposit with such an atmosphere of mystery that even the general considerations which I could advance, so far at least as they were based upon a careful study of specimens, appeared to be not without some value.

A. WENDELL JACKSON.

Blasting in Mines—No. 11.

Classification of Rocks.

Of course very few miners can classify rocks geologically, or tell the mineral constituents. Still some slight knowledge of this kind ought to be acquired, as it will enable him to apply his skill and strength to the best advantage. Some knowledge is acquired in daily practice, and careful observation will greatly increase this. He should observe the character of the rock he is working on, and the kind of tools employed for special work. Great variation exists in the hardness and coherence of rocks. A rock that is abundantly jointed may be excavated with much greater facility than one in which the joints are sparsely developed.

It is also evident that a stratified rock will yield more readily than one of the igneous class where there is no lamination. The classification of rocks, therefore, according to their power of resistance to excavation and the adaptation of tools and other means to the requirements of each class, constitute a matter of great importance in mining. The use of unsuitable means, or suitable means improperly employed, occasions waste. Ignorance in respect to the classification of rock often results in accidents also, and loss of life. Andre, in his "Coal Mining," says on this subject:

For the purposes of excavation, rocks may be classified into (1) loose rock; (2) soft rock; (3) tender rock; (4) compact rock; and (5) hard rock. The first of these classes, or loose rock, includes uncompacted sand, vegetable earth, and disintegrated rock of any kind that has little or no coherence among its particles. Soft rock comprises plastic clay, loam and marl. Tender rock includes all rocks of an indurated character that have but little coherence between their laminæ, as shale, or that are much broken up by joints. Compact rock includes rocks of a moderately fine texture that have been firmly compacted and cemented, as sandstones, and some limestones. And hard rock comprises the igneous rocks, the hardest limestones, and the conglomerates.

Loose and soft rocks may be easily cut by the shovel and spade, and these tools will, therefore, be chiefly employed in excavating them. The pick will be required as an auxiliary instrument to loosen the rock in some cases. In excavating tender rock, the pick will constitute the chief tool, the shovel being used merely to clear away the dislodged rock. In applying this tool, it must be borne in mind that rocks of a shaly structure cleave readily along the planes of lamination, but are often very resisting in the direction of right angles to these planes. When the rock is jointed, there will always be one direction in which any given block will yield more readily than in another. By taking account of the planes of lamination, cleavage, and jointing, means will be perceived by which the block may be dislodged with the least expenditure of force. Also the most suitable form and angle of cutting-edge and degree of temper may be determined by a consideration of the mineral composition and structure of the rock. These and other circumstances peculiar to the case to be dealt with will afford abundant opportunity for the exercise of the judgment. When tender rock of a jointed character occurs in the roof of underground workings, it is of the highest importance to note its features attentively.

Hardness and strength are qualities by no means identical. A rock-bed composed of silicious materials strongly cemented together may be so fissured by jointing as to fall readily when undermined. To ascertain the strength of a rock roof, the miner strikes it with some sharp instrument, as a hammer, sledge, or pick. A dull sound indicates the existence of joints, and a sharp sound, free from ring or echo, continuity and strength. In placing the prop timber, it is obviously necessary to consider the character of the jointing, in order to obtain a maximum degree of security with a minimum expenditure of material. The excavation of compact rock is effected by means of the pick, the wedge and explosive compounds. In proportion as compact rock approaches in character tender rock on the one hand, and hard rock on the other, the use of the manual tools or of the explosives will predominate. It must be remarked, however, that the use of explosives is rapidly extending even to rocks of the tender class. The dislodgement of hard rock can be effected only by means of explosives. The pick and the wedge are required as auxilliary tools to complete the dislodgement of blocks which have been only partially effected by the action of the explosive. The effective placing of the blasting holes requires a full appreciation of the character of the rock relatively to its mineral composition, its structure, texture and system of jointing. In rock-drilling by machinery, the structure and texture are particularly important, for while the mineral composition of the rock will determine the proper temper of the drill and the angles of its cutting edges, the structure and texture will determine its most suitable form. A celular or "vughy" rock, for example, may be best penetrated by a form of drill which would prove less effective in a rock of compact texture.

THE CANNON-BALL QUARTZ CRUSHER.—The Grass Valley *Union* says: Another trial of the Dyer Cannon-Ball Quartz Crusher was made yesterday at Brunsteter's planing establishment, in the presence of a number of spectators. The quartz provided for the trial was hard clear quartz without any admixture of earth. A number of tests were made, one of which gave a crushing of 600 pounds in one hour and twenty minutes; and one of 100 pounds in ten minutes; one of 100 in seven and a half minutes, the machine being driven at different rates of speed. The quartz passed through a No. 5 screen, and was discharged as a fine pulp, ready for any amalgamating process. The machine is rated as capable of crushing six tons of quartz in 24 hours. The tests made yesterday and on previous occasions show that it will do more. As a prospector and for ordinary mining operations it seems just the machine that is needed, and such was the opinion of those who saw it at work yesterday.

REAR ADMIRAL PIERCE CROSBY, commanding the naval forces in the Asiatic station, telegraphs the Secretary of the Navy, asking to be relieved and placed upon the retired list.

Metallurgy and Ores.

Nevada Metallurgical Works.

HYDRAULIC GRAVEL ELEVATORS.

The Great Problem of Shallow Hydraulic Mining Solved.

NEW FIELDS OF ENTERPRISE IN HYDRAULIC MINING OPENED UP.

These machines are thoroughly effective for working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon.

At the property of the Yreka Creek Gold Mining Company, in Siskiyou county, Cal., an Elevator of the Improved Form has been introduced, which, with a head or pressure of water of 266 feet, is elevating through an 18-inch machine to a vertical hight of 46 feet from bedrock to upper flume.

☞Descriptive Catalogues and prices furnished on application to the undersigned, who are the sole manufacturers of these machines.

WANTED. Situation as Mining or Mill Superintendent by a graduated Mining Engineer and Metallurgist, who has had many years practical experience in Arizona and Mexico. Best of references given. Address, ENGINEER, this office.

THE ROLLER ORE FEEDER.

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use.

It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery, as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LARGEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast Iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

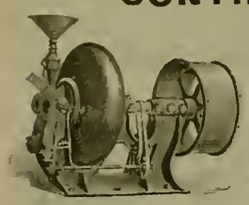
Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,

Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.



CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pluc Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x00. This latter size furnished J. B. Haggin for Giant and Old Abe Co., Black Hill also Corliss Pumping Engines, 26x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars. McCaskell's Patent Car Wheels and Axles—Best in Use.

Principal Office and Works, Fulton and Union Sts., Chicago, Illinois. New York Office, Walter McDermott, Manager, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.

For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, OOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanica in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

Paper Rulers & Blank Book Manufacturers

505 Clay Street, (southwest corner Sansome),

SAN FRANCISCO.

COPP'S U. S. MINERAL LANDS,

Laws, Forms, Instructions and Decisions.

Has no surplus verbiage. Contains Dr. Raymond's Glossary. Explains how to examine mining titles. Contains numerous court decisions. Gives the Public Land Commissions Codification, and gives many an improved forms. Price—Full law binding, extra paper, $3.00.

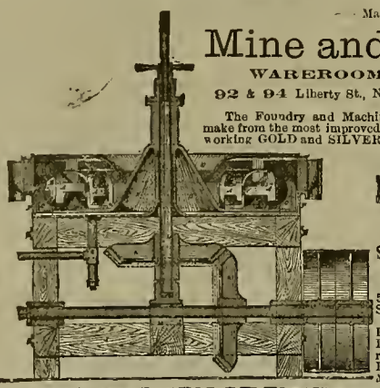
For Sale by DEWEY & CO., San Francisco.

Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

[ESTABLISHED 1864.]

THE MOREY & SPERRY MINING MACHINERY COMPANY,



Successors to MOREY & SPERRY,

Manufacturers of all Kinds of

Mine and Mill Machinery

WAREROOMS: 92 & 94 Liberty St., New York. WORKS: Newburg, - New York.

The Foundry and Machine Shop having been enlarged we are now prepared to make from the most improved patterns QUARTZ and STAMP MILLS complete, for working GOLD and SILVER ORES.

MOREY'S IMPROVED PULVERIZER.

MOREY'S IMPROVED PULVERIZER,

For WET or DRY Crushing.

SIMPLE, EFFICIENT and DURABLE

The Balls revolve **Horizontally** without friction. 5 ft. size, weight 7,000 lbs., and does more work than 15 Stamps. 3 ft. size, weigh 3,000 lbs.

Concentrating Mills, Rock Breakers, Amalgamating Pans and Separators, Roasting Furnaces, Hoisting and Pumping Machinery, Engines and Boilers, any size required, Hydraulic Giants and Pipe, Ore Cars, Ore Buckets, Safety Cages. The Hand Power Two-stamp Mill weighs 250 lbs. THE EUREKA WIRE ROPE TRAMWAYS, Concentrating Riffles for Mills and Hydraulic Sluices.

Steel SHOES and DIES for Stamps, and Mine and Mill Supplies. Agents for IMLAY ORE CONCENTRATOR and the MINERS' HAND ROCK DRILL. Information and Estimates cheerfully given **Send for Catalogue.**

Address, THE MOREY & SPERRY MINING MACHINERY CO.

DEWEY & CO.'S

Scientific Press

Patent Agency.

[ESTABLISHED 1850.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

Manufacturer of all kinds of Chemical Stoneware —FOR— Manufacturing Chemists. Also Chemical Bricks for Glover Tower.

Mechanics' Fair Notes.

California Brass Works.

The California Brass Works, one of our old-established local manufactories, has a display which shows that their work is confined to no special class of goods. Messrs. Weed & Kingwell, the proprietors, have been in business here a long time, and have built up a steady trade. Among the articles exhibited are several forms of hinges, bells, gongs, steam-whistles, basin bibbs, cocks, railing, valves, lubricators, nozzles, row-locks, boat-hooks, gauges, couplings, block-sheaves, latches, safety-valves, brass nails, spikes, etc. These articles are exhibited just as they are made and ready for sale, no fancy finish having been added.

Organ Manufacture.

In the art gallery there is on exhibition a large Bergstrom organ, made for the Episcopal church at Los Angeles. It is a handsomely finished instrument, and well made in all its parts. The factory of Bergstrom & Co. is one of our well established and growing home industries. Mr. John Bergstrom began the business here in 1864 on a very small scale, but it has grown so there is a large factory, well equipped for making small or the larger size organs. The largest organ on the coast, that in the Metropolitan Temple, was built by this firm. They make the whole organ here except the reeds, and all the details of the mechanism are carefully carried out. California woods are used wherever practicable. Organs made by this firm are in use all over the coast, not only in California, but in Oregon, Washington Territory, Nevada and Arizona. Some have even been sent to Central America.

The San Francisco Tool Company.

The exhibit made by this company is one of the most creditable in the fair, not only from the character of the articles, but from the excellent workmanship and originality of the designs. From a small beginning the works have been much enlarged, and the scope of their manufacture greatly increased. As an entirely new industry on this coast, its growth and prosperity is very satisfactory. They exhibit a 24-inch and 16-inch engine lathe, standard, and a 24-inch hollow spindle lathe. There is also one of the new drilling machines with an improved motion. It is a curious machine. The spindle is moved rapidly for a range of twenty-four inches up and down, and when stopped at any point within that stroke is ready to operate instantly.

The feeding mechanism is similar to that employed on the engine lathes made by these works, operating by friction, and yielding when the pressure is too great. The table for supporting the work, contrary to the usual practice, is made rectangular, with a solid angle plate attachment at one side, which does not prevent the lathe from being turned around the same as a circular one.

The dimension sawing machine for making patterns is the first ever shown here. It is the finest specimen of mechanical work in the fair. It is not a sawing machine, in the ordinary sense of preparing lumber ready for planing, but is so made, and the saws are so arranged, that all kinds of pieces are cut to absolute dimensions ready for varnishing for use, requiring no planing afterwards. Thirty of the large engineering establishments in Europe use these machines, which will hereafter be made here.

They also exhibit 2, 4, 6, 8 and 10 inch turbine pumps. The ten-inch one is a departure from all the methods of construction followed heretofore, either by these works or others. It is a double pump in every way. There are double inlets, double pulleys, four bearings on the shaft, and the casing is parted horizontally. The pump weighs about 1,200 pounds. There is also one of their well known planers of large size. There is a new shaping machine designed within the past year, such as we illustrated not long since.

Another object of interest is the experimental blower made preliminary to going into the manufacture of this class of goods. It is made analogous to the turbine pumps, and one of them has lifted eleven inches of water. The casing is solid in one piece. The runner is of wrought iron and steel plate, there being no castings about the runner. A remarkable feature is the small size of the blower in proportion to its capacity. The runner is nearly as large as the casing. This is rendered possible by the discharge being tangentially and over the side of the runner and into the casing. There is also exhibited a hydraulic mandrel-driving machine, made on the plan of Messrs. Smith & Carpenter, of Manchester. The San Francisco Tool Company are going to make these machines here. A very fine piece of workmanship, indeed, is the head of the new planing machine now being constructed. It will be thirty-three feet long, and will plane twenty-nine feet long and thirty-six inches wide. This piece of work has attracted great attention from skillful mechanics. They also show some of their gauging implements, measuring machine, etc. They have also a hydraulic jack made wholly of steel, weighing about half what these things usually do. It is a four-ton jack.

Almalgamating Plates.

On the side wall near the right-hand entrance to the machinery department is a large silver-plated sheet of metal, which to the ordinary observer would hardly appear so important a thing as it is. This is a silver-plated amalgamating plate, one of the appliances which has done much towards a more perfect system of saving gold on this Coast since its first introduction by Mr. Denniston, of the San Francisco plating works. It is used for quartz, gravel and placer mining, and for saving fine gold is unsurpassable. In fact the old-fashioned bare copper-plate has been entirely superseded in all good quartz mills, these plates taking their place. The San Francisco plating works are fitted up to make very large plates of this kind, making a specialty of the business. They not only supply this state, but Oregon, Idaho, Montana, Utah, Colorado, Arizona and New Mexico. The plating is quite heavy, and will not scale or break off. These works have lately been enlarged, and their facilities increased to keep pace with the business. Gold, silver, nickel and copper plating on all metals is done. Mr. Denniston is the pioneer in this business on the Coast.

Pacific Saw Manufacturing Company.

This old established and successful representative of progressive home industries always has one of the best arranged exhibits in the annual fairs in this city. Not only is the display arranged with taste and judgment, but the variety and style of the products also calls for commendation. The invention of Spaulding's improved insertible saw teeth a long time ago had the effect of making this company known all over the United States, and the manufacture of these saws and teeth is still a specialty with the company. They make their saws of metal of superior character, and keep track of every improvement in their line. They make not only saws of every conceivable kind, but saw mandrels, springs, planers and curriers knives, gummers, etc. About fifty men are employed here in the various branches of manufacture. Circular saws up to 75 inches in diameter are made. The company is also agent for C. B. Paul's files, a widely known brand of this useful implement.

The Judson Manufacturing Company.

This company is one of recent growth, but its development has been so rapid that it has taken its stand as one of the representative home industries The character of the products are such as to bring them into very general use. The company control the Clipper Gap Iron Mines, Placer County, this state, the largest iron mine on this coast. The establishment near Oakland, is one of the largest in California. There are numerous buildings, blacksmith shops, a rolling mill, etc. The equipment of the establishment is very complete in all respects. One of the most interesting features of this factory is the manufacture of tacks. At the exhibit in the fair is a case with 350 kinds and sizes of tacks, clout, trunk and finishing nails. The Judson file works is represented by a fanciful arrangement of files on the side wall of the display. This is a new industry on this coast. Various styles of files are made. The California Victor Mower is one of the principal articles of manufacture. This machine has been very successfully introduced by the company, and is specially adapted for heavy crops and hard work. Among the varieties of hardware made by the company, are barn-door hangers, rail and pulleys, well wheels, cast washers, sledges, hitching weights and posts, etc. The Judson horseshoe nails form another very important branch of local manufacture. The California Iron and Steel Co., at Hotaling, have in this display samples of iron ore, pig iron, etc. The products bring high prices in our market, and are well known.

Medals and Diplomas.

A partial list of the award of medals and diplomas sent in by the committees is a follows:

Gold medals, class 21—Larkins & Co., best general display of carriages; Waterhouse & Lester, best display of articles used in the manufacture of carriages and best display of bicycles; David Kerr, best two or four-horse truck.

In class 22, the California Furniture Manufacturing Company takes the gold medal for the best general display of furniture; the J. M. Brunswicke & Balke Co. for the best display of billiard tables; the Statham Piano Co. for California-made pianos; John Bergstrom for best pipe organ.

The silver medals have so far been adjudged as follows: Robert Reed, for artificial limbs; P. F. Butler, for milliuery; Adolph Ghoring, for artificial flowers; Mark Sheldon, for sewing machines; Mrs. Ober, for corsets; Kohler & Chase, for brass wind instruments; Zeno & Mauvais, for musical instruments; Charles Morrell, for California-made banjos; Studebacker & Brothers, for carriages other than California manufacture; Larkins & Co., for best hack, best coupe and best top buggy of California make, separate awards; David Kerr, for best single or one-horse truck and dump or coal cart; Jerry Lowney & Son, for best platform spring wagon; A. W. Sanborn & Co., for milk wagon; Baker & Hamilton, for four-spring, two-seat wagon; M. J. McCue, open rockaway, also phaetons; Charles Oester, axles; J. A. Bills, two-wheel carts; Studebacker Bros., farm wagons; West Coast Furniture Company, parlor set, bedroom set, sideboard, separate awards; Indianapolis Chair Company, extension bed lounge; Wakefield Rattan Company, rattan furuiture; Hardie & Darling, decorative wall hanging.

The bronze medals are thus far distributed to P. Liesenfeld, billiard-table cushion; J. M. Brunswick & Balke Co., billiard tables for parlor use; California Furniture Co., best dining-room set; also for assortment of chairs; Chadbourne & Co., folding bed; B. F. Farrar, sofa bed; G. W. Clark & Co., window shades and fixtures; also for wall paper; Gilbert & Moore, office desk; A. J. Bailey, ostrich feathers and plumes; W. E. Shaw, open buggy; Geo. Hall & Co., farm wagon; M. J. McCue, carriage and buggy wheels; Henry Hartop, butcher cart; W. E. Shaw, double cart; B. Grave & Co., jump-seat buggies; E. D. Boncelli, musical instrumeuts; Hallet, Davis & Co., imported pianos; B. Galland, portable bath.

The approved diplomas are awarded to: J. M. Brunswick & Balke Co., billiard balls, cues and racks; Gilbert & Moore, office furniture; Pacific Spring Co., slat spring-bed; T. S. Clark & Co., metal spring-bed; C. H. Townsend, kitchen table; S. & G. Gump, pedestals; California Furniture Manufacturing Co., easy chair; Waterhouse & Lester, truck and wagon wheels not on vehicle; Wakefield Rattan Co., child's carriage; Walter Hyde, hobby horse; B. Grave & Co., specimen of carriage blacksmithing; M. J. McCue, buggy wood-work; San Jose Agricultural Works, fruit wagon; Henderson & Thompson, parallel spring for buggy; J. W. Coppage, machine-made buttonholes, Studabecker & London, tailor's square; G. H. Stebbins, steam bath; Wm. Beeman, trousers and braces.

THE very best iron preparation, and the one having the largest sale, is Brown's Iron Bitters.

THE Dominion government is making an effort to minimize, so far as possible, Sunday labor in connection with the postal service.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.
M. H. JOSEPH—Eureka, Nev.
I. M. LEIBY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county.
H. W. FOLSOM—Los Angeles county.
C. E. CURTIS—Kern and Inyo counties.
A. S. DENNIS—San Mateo county.
GEO. FRANCOEUR—Shasta county.
J. W. BOYER—Contra Costa county,

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time they intend to pay for it*, let them not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent.

INFORMATION WANTED.—Information is wanted of Wm. Erskine, who has been living near Hailey, Alturas county, Idaho Territory, for two years past. His wife has not heard from him since last Spring. He was President of the Miners' Union of Silver City, Idaho, five or six years ago. Any news of him would be thankfully received by Mrs. Hannah Erskine, of Nevada City, Cal., or R. H. McDonald, Los Angeles, Cal.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life The number of sea lions is increased, and there is a better chance to study their actions The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 27th day of September, 1883, an assessment (No 4) of ten cents (10c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 528 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Monday, the 19th day of November, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. MARTIN, Secretary.

OFFICE—Room 6, No. 528 California Street, San Francisco, California.

QUARTZ MILL FOR SALE.

A TEN-STAMP QUARTZ MILL COMPLETE, including Battery Frame, ten 750-lb. stamps, high mortars; one 9-foot Knight Water Wheel; about 1,000 feet iron pipe, 6 to 10 inches; one 14-foot buddle; shafting, belting, copper plates, etc. All in good condition and nearly new. At GRIZZLY FLAT, EL DORADO COUNTY, CAL.

Inquire of L. S. Taylor, Attorney-at-Law, Sacramento or Wales L. Palmer, at Golden State and Miners' Iron Works, 237 First St., San Francisco.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

286,158.—ELECTRIC CUT-OFF—John A. Tupper, Salt Lake City, U. T.
285,942.—ROAD ENGINE—John S. Woolsey, Gilroy, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

GRAFTING TOOLS.—Kenneth McLennan, Berkeley. No. 285,910. Dated Oct. 2, 1883. This invention relates to certain improvements in that class of grafting tools in which the cutting tools are adapted to be actuated by a hand implement. It consists in a peculiar angular knife fitted into one of the jaws of the implement, in an opposing block in the other jaw, against which said knife is adapted to operate, and in a means for adjusting and limiting the movement of the knife against said block. The object is to prepare the scions and stocks of young trees or vines for grafting by means of a peculiar counter graft on each, whereby the two may be fitted togcther with an advantageous union by close and perfect joint. Union of the stock and scion has been heretofore accomplished by a joint made by tools similar in operation to this, but with knives of such shape as not to be able to make a cut in each providing for so advantageous and perfect connection as this kind of knife permits.

GUARD FOR CARS.—John Craig, S. F. No. 285,975. Dated Oct. 2, 1883. This guard attachment is specially adapted for cable cars, and is intended to prevent accidents by furnishing a means for keeping persons from getting under the wheels. An iron frame with side pieces and cross pieces is secured on the axles. The ends of this frame are inclined downward until they reach within a short distance of the road-bed. The ends are hinged and limited in their downward movement. Under the lower bar, on the guard, are rollers which impinge on the track. The device is steady. Being secured to the frame it travels at a uniform distance from the road-bed, and will neither strike small obstructions nor rise up, thus adapting it for its purpose.

CLAMP FOR STONEWORK.—Jeremiah O'Connor, Piedmont, Alameda County, Cal. No. 285,918. Dated October 2, 1883. This invention relates to a means for clamping stonework together so as to form a solid permanent bond or union between the separate stones forming a structure. It consists of metal bars formed to enter the hole made in the stones to be united, and keys by which they are secured thereiu, and a union or screw coupling by which the two are drawn or held together.

ROAD ENGINE.—John S. Woolsey, Gilroy, Cal. No. 285,942. Dated Oct. 2, 1883. This steam or power road-wagon consists of a pair of friction wheels mounted on a shaft above the bearing wheels of the wagon, driven by the engines, means being provided for throwing them into and out of contact with the bearing wheels, so as to drive or stop the wagon. By applying the power on the rims of the wheels a saving is affected. Springs allow the boxes of the shaft carrying the friction wheels play enough so they will accommodate themselves to any inequalities upon the rims of the wheels, or to any stones or dirt that may adhere to them as they revolve.

ELEVATING AND CARRYING APPARATUS.—Ira Bishop, Benicia, Cal. No. 285,873. Dated Oct. 2, 1883. The improvements consist in a traveling elevator belt, provided with peculiar hooks; in a carrier belt above to receive the load, and in the mechanism for driving the belts and for changing the direction of the carrier belt. The general object of the invention is to elevate material or articles from one point to another, and to transport them to different places; but the particular use to which the apparatus is adapted is to raise material or sacks from the ground or lower floor of a warehouse to the upper floor, and to carry it along on said floors to points desired.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a leaf.

The Secret

of the universal success of Brown's Iron Bitters is simply this: It is the best Iron preparation ever made; is compounded on thoroughly scientific, chemical and medicinal principles, and does just what is claimed for it—no more and no less.

By thorough and rapid assimilation with the blood, it reaches every part of the system, healing, purifying and strengthening. Commencing at the foundation it builds up and restores lost health—in no other way can lasting benefit be obtained.

75 Dearborn Ave., Chicago, Nov. 7.
I have been a great sufferer from a very weak stomach, heartburn, and dyspepsia in its worst form. Nearly everything I ate gave me distress, and I could eat but little. I have tried everything recommended, have taken the prescriptions of a dozen physicians, but got no relief until I took Brown's Iron Bitters. I feel none of the old troubles, and am a new man. I am getting much stronger, and feel first-rate. I am a railroad engineer, and now make my trips regularly. I can not say too much in praise of your wonderful medicine. D. C. MACK.

BROWN'S IRON BITTERS does not contain whiskey or alcohol, and will not blacken the teeth, or cause headache and constipation. It will cure dyspepsia, indigestion, heartburn, sleeplessness, dizziness, nervous debility, weakness, &c.

Use only Brown's Iron Bitters made by Brown Chemical Co., Baltimore. Crossed red lines and trade-mark on wrapper.

NOTICE TO CREDITORS.

ESTATE OF ROSEMOND GREENWOOD, deceased.—Notice is hereby given by the undersigned, executor and executrix of the last will and testament of Rosemond Greenwood, deceased, to the creditors of, and all persons having claims against the said deceased, to exhibit them with the necessary vouchers, within four (4) months after the first publication of this notice, to the said executor and executrix, at the office of E. W. Blancy, Esq., attorney-at-law, No 526 Montgomery Street, the same being the place for the transaction of the business of said estate, in the City and County of San Francisco.

Dated at San Francisco, the 2d day of October, 1883.

GEORGE SPAULDING,
MARY WILLIAMS,
Executor and Executrix of the last Will and Testament of ROSEMOND GREENWOOD, deceased.

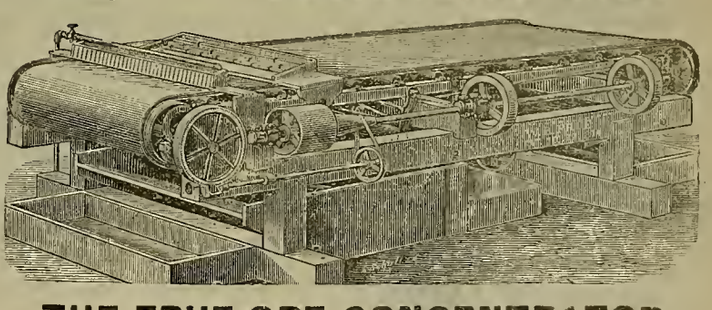
CENTRIFUGAL ROLLER QUARTZ MILL!

CAPACITY AND DURABILITY GUARANTEED.

MILLS ERECTED WITH ALL APPLIANCES COMPLETE.

After running one of those mills on the Wanden mine, in El Dorado county, over four months, and thoroughly testing its capacity and durability, I am prepared to offer it to the mining public, and claim for it the following advantages over the drop stamp mill:

1. The cost of same capacity is not more than one-half that of stamps.
2. Freight to mine one-fourth that of stamps.
3. Cost of erection at mine one-tenth that of stamps.
4. It runs with one-third the power per ton of ore crushed.
5. The wear is less than that of stamps.
6. The wearing parts are easily duplicated.
7. It has a much better discharge, and leaves the pulp in better condition for concentrating.
8. It is a better Amalgamator, saving fully nine-tenths of the gold in the mill; the balance can be saved on plates in the usual manner.
9. It is continuously crushing; not like the stamp, using power to suspend it in air ninety-nine one-hundredths of the time, and the balance making a thundering noise, and accomplishing *comparatively* small results. It is as far in advance of the stamp mill as the present method of making flour with improved rolls is over the Indian's mode of crushing corn in a stone mortar.



PATTEN'S CONCENTRATOR.

This machine requires less power, less care or attention, and is less liable to get out of repair than any concentrator now in use. All of which any practical miner will comprehend when seeing it in operation.

The wear and tear is nominal, and the construction so simple that any miner can put it up and run it; and the low price brings it within the reach of all mill men, as it will save enough to pay for itself in any mill in a very short time. One machine will concentrate the tailings from a five-stamp battery.

SHINGLE MACHINES AND SAWMILL MACHINERY OF EVERY DESCRIPTION.

$1,000 CHALLENGE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

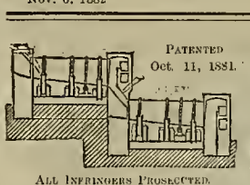
Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.



That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shake machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.

That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

VOLUME XLVII Number 16.

Copper Smelting Plant.

The practice with regard to smelting furnaces has changed very much in the past few years, and now water-jacket furnaces mainly are used for galena and copper ores. The furnaces and equipment are furnished complete ready for shipment, and very little time is lost in setting the outfit up on its arrival at the mine. The engraving on this page shows a complete smelting plant for copper ores, as built by Fraser & Chalmers, of Chicago, Ill., who make a specialty of the water-jacket furnace, and have fitted up a great many plants in different parts of the country. From their circular, giving the specifications for a thirty-ton copper-smelting plant, we take the following, showing, as it does, how many things are necessary aside from the furnace itself: Water-jacket copper-smelting furnace, with all latest improvements, including water-jacket made of wrought iron, 36 inches in diameter, 9 feet high, containing 6 tuyeres, wind-box, and improved water-circulating attachment; bottom plate, with dumping doors; four cast-iron columns for same; sheet-iron bonnet and smoke-stack, with guys; blast pipe, with necessary elbows and wind-valve; six improved slag pots, with cars attached; four hullion pots, with cars attached; hullion truck, dumping plate and track; pair of adjustable molds, and plate for slag brick; pair of hullion tongs; 350 pounds octagon steel furnace-bars; a four and a half Baker blower; No. 2 Blake crusher, 10x7, with extra set of jaw plates; belts for blower and breaker; fifteen horse-power 8x12 stationary steam engine for driving blower; twelve horse-power stationary steam engine for driving crusher. These engines are complete, including governor, foundation bolts, oil cups, main pulley, fly-wheel, etc. There is also a tubular boiler, 42 inches in diameter by 12 feet long; iron C. H. No. 1 flange used throughout; steam drum and mud drum; fire front grates, wall binders, back arch, soot door and frame; breeching No. 10 iron; smokestack 22 inches by 40 feet; 300 feet galvanized iron guy ropes; safety-valve, steam-gauge, and water-gauge; three register gauge-cocks; steam whistle; No. 3 Knowles steam boiler feed-pump; heater and exhaust pipe.

COPPER SMELTING PLANT.

The makers advise shipping with the machinery about 400 fire bricks and three barrels of fire clay. A furnace of the size described will require in the neighborhood of 25,000 gallons of water per 24 hours if allowed to run to waste. The greater portion of this water can be saved by using a reservoir and pumping back into storing tanks. By this method only about 3,000 gallons of water will be consumed per day. An extra steam pump will be required then for pumping. In all cases a steam pump should be taken to raise the water from the well to the supply tanks, if the source of supply is not so located that the water will flow into the works at the level of the supply tanks. With larger works, a single engine to drive every thing is recommended. In the furnace, 25 to 30 bushels of charcoal are required for each ton of ore, or one ton of coke to seven tons of ore, varying in amount according to character of both ore and fuel. For ores of base character, such as those containing sulphur, arsenic and antimony, additional appliances are necessary for driving off these substances before smelting. This can be done at small expense by roasting in heaps or in the various roasting furnaces made for the purpose. Sulphurets carrying silver can sometimes be worked to better advantage by reducing the whole product into a matte. The makers of this plant arrange the furnace stack so that a dust chamber condenser can be attached if desired.

ORIGIN OF THE UNIVERSE.—The well known Parisian editor, M. Moigno, has written a paper on the synthesis of the heavens and the earth. In this he makes the deduction that everything originated from ether, which first generated hydrogen. To an impulsation of ether he attributes the existence throughout the universe of the action of gravitation.

THE Treasurer of the Irish National League at Dublin has returned to the donors at San Francisco a draft letter for the benefit of the families of the Phœnix Park murderers, on the ground that the League would be placed in the attitude of encouraging assassination should it distribute the money.

A PERMANENT exhibition building is to be one of the attractive places of amusement in Baltimore, Md. It is to be built of brick, marble and iron, and is to cost $500,000.

Mules Underground.

Mules seem to be more useful about mining operations than horses. In running an arastra a mule is much better than a horse. He will get sly and shirk work if he can by going very slowly, but may be encouraged by rocks and other missiles to quicken his pace. He will stand this treadmill work well and thrive on it, while the nobler animal will wear out.

Underground the mule is preferable in many ways, and these animals are generally used there instead of horses. They are intelligent, and if they fall and are entangled, are apt to lie quietly while being released, instead of kicking and thrashing about to their own injury as a horse will do. Some people have a prejudice against them, alleging their tendency to kick, but underground they do not seem to do that, whatever may be the case above. They become very tame when underground. Mr. Sutro describes those in use at the famous tunnel as having become the miners' pets. He says the men become attached to them, and as the shaft mules pass along by the men at lunch, edibles are given them. When signal is given to fire a blast the mules understand the signal, and will try to get out of the way of it just as the men do. Of course the mules become accustomed to the darkness, and in going out into the sunlight can not see very well, and when they go back from the sunlight into the tunnel they can not see at all. At the Sutro tunnel they are in the habit of covering one eye of the mule until they go into the tunnel again, when the cloth is removed, so they have one good eye to see with. This plan had to be adopted, because the mule is so stubborn he will not pull unless he can see his way ahead. At this place another thing was found out about mules. They tried horses at first, but found that whenever anything touched the ears of a horse he would throw up his nose and knock his head against the roof; but if you touch a mule's ears he drops his head. The horses were given up, and mules answered very well.

Development Companies.

A new method of carrying on mining operations is shortly to be tried here which has some novel features that should make it popular both with miners and capitalists. The idea is to form a company which shall put up certain money for the purchase of mines. The first thing to do is to bond a number of small unprospected mines and prospect them, spending a few thousand dollars more or less on finding their value, and in case they develop well to buy them. Mr. John Hays Hammond, of the firm of Wagoner & Hammond, Mining Engineers, went East this week with the object of forming a company of this sort. Some gentlemen there, acting on his suggestions, propose forming a development company with a working capital of $250,000. If a miner has a good looking claim, with no money to carry it on and prospect it, the company proposes to bond it and prospect it themselves, with the privilege, previously secured, of purchasing at a stipulated price in case they think the property worth it.

It is intended to have experts examine these properties, of course, and two or three men may be kept in the field looking up favorable claims. It will of course be necessary to be careful in the selection of the mines to prospect, and to be also careful of expenditures in prospecting. In case of a few failures it will make little difference, provided a good mine is found occasionally.

Most men owning prospects ask too much for undeveloped properties, but it is thought that if they find the claims will be prospected they will be willing to bond on reasonable terms.

So confident is Mr. Hammond that his plan will work that he has given up a good position in Mexico to take up this system. He goes from here well recommended, and under favorable auspices. In his connection with the U. S. Geological Survey, the Census, and the Mint Director's work, he has become familiar with the mines of this state, and considers them preferable. There are very many good quartz mines here in California, now lying idle, which might be bonded for purchase with readiness. This plan seems in every way preferable to that of buying only one mine and spending many thousands to prove its value. By the system proposed, only those would be purchased which developments proved worthy, and those left on the owners hands would be better than when taken hold of, as far as developments were concerned.

THE arrival of the Carmel River water, conducted through the pipes of the Pacific Improvement Company, at an expense of over $500,000, was celebrated by the citizens of Monterey Sunday night.

Great Salt Lake.

A Voyage of Discovery on the Big Inland Sea.

With several members of the Agassiz Association an excursion trip was taken lately on Great Salt lake. Going out to Lake Shore on the swift little Rio Grande train, we landed in about half an hour and found our boat waiting for us. After stowing away our collecting bottles and cans, insect nets, egg baskets, hammers and other paraphernalia, we breathed easier, knowing that as long as they were out of sight no old toper would ask for a drink of our alcohol and corrosive sublimate, that no one would take us for perfumery and comb peddlers, nor wink with Western shrewdness at the idea of catching fish in the lake. At the pier we found the water only a foot deep, where two years ago it was three or four. Even the mud was furrowed up by boats which had come up to the landing.

Hoisting our sail we passed out toward the middle of the lake. For six or eight miles we sailed over water that was nowhere more than two or three feet deep. Some five or six miles out we struck broad patches where the bottom was covered with the dead shells of fresh water molluscs, washed in from Hot Springs lake, caught by the roots and stems of the salt grass and some bulbous plants, which forty years ago flourished there and were overwhelmed by the rising brine, and perfectly preserved for a generation. The water has so nearly reached its level of 1840 that the high waves wash up the roots and cast them upon the beach, where they are now to be found. The storm line of that year is now at the water's edge, and the ancient sagebrush that grew immediately behind it now stands like ghostly sentinels over their graves. For over forty years this same sagebrush has stood deep beneath the water, like the submerged forests of the Columbia river.

A stiff breeze soon sprang up from the south, and we went booming along in full view of Antelope (Church) Island, toward a dim, low island (Fremont's) to the north of it. Night dozed around us; midnight came and went, and just as Fremont Island loomed up in the darkness, a great red finger rose rapidly behind the distant Wasatch, and towering up, seemed to bend toward us as if to warn us not to disturb the island's solitude. The new moon never seemed so awe-inspiring nor more unlike itself as it rose half out behind the hills.

Fremont Island.

Ere long the gravelly shore of Fremont Island was reached, and soon all the party were fast asleep on the beach. One of them had taken the precaution to tie the halliard rope around his body, and in about two hours he found himself traveling toward the water, the strong waves having loosened the boat. About dawn he was again doubled up by the rope. Had it not been for this precaution, all the party would have graced the solitude with their presence, and the boat would have sailed alone. The next morning most of us studied the ancient beach of the island, and gathered splendid specimens of specular iron ore and slate. Our geological books informed us that the island was a mere pile of rocks, barren, and without water; what was our surprise, therefore, to find it smooth and rounded, with but few cliffs and dotted with sheep, which of course meant at least one good spring upon it. Descending to the shore, we found the sand to be angular, like that of the ocean and most fresh water lakes, this being almost the only place where the peculiar oolitic (egg-shaped) sand of the lake is absent.

Soon we were on our way toward the hazy western shore. As we passed along, the seagulls circled around us or floated on the water, their white plumage shining in the sunlight. Every now and then a hawkmoth would flit by or alight on the boat, dragon flies would stop long enough to gaze at us curiously and then spin off toward the distant islands. Occasionally a 17-year locust would hum past as if to mock at us for ever daring to believe that this is the

"Dead Sea of America."

As the bow plowed through the water millions of small *diptera* (flies) would rise from the water, where they were resting, and cover the bow of the boat till quarts of them could be collected. Wherever we went we observed the same thing. The water of the lake is their home, and they are as much at ease sitting on the water as a skipper is on an eastern pond. In some places when it is calm these flies darken the water for miles. Here (not on the beach) they lay their eggs; here they hatch, and here the larvæ live by the million till ready for the pupa state, when they attach themselves to the seaweed (floating everywhere in the water) and remain till they emerge as perfect flies. The larvæ doubtless prey upon the strange little shrimps that live in the water. There are infinite numbers of these, as there is scarcely a place in the lake where a bucket of water can be dipped without taking up from 20 to 500 of them. It is strange that people should call this a "dead sea," for though the number of species does not exceed 10 or 15, there is no lake, fresh or salt, in the world that contains half as many living things as Great Salt Lake.

Small Islands.

In the course of the forenoon we reached and explored several small islands near the western shore, then passed around the northern shore of

Stansbury Island.

This is the most interesting of all the islands of the lake. We had previously explored it, finding some very rare plants, insects and fossils. The eastern side is indented by numerous open bays, which sweep from point to point in arcs of circles like so many bended bows. The beach is composed of fine white sand, free from boulders, and slopes quickly to the water, where it forms a beautiful bottom. A few rods from shore the water is deep enough to satisfy the most fastidious, thus making the most delightful bathing places on the lake. The view obtainable from the island's lofty peaks is unexcelled.

Leaving Stansbury behind, we sailed for the north shore of

Antelope Island,

Passing over the deepest water in the lake. When we reached the shore the breakers were rolling so high that we could not land. Passing around the point we soon reached some springs of water where we quenched our thirst and refilled our empty cask. Here we saw considerable stock upon the hills.

The remainder of our trip to Lake Shore was without incident till we had almost reached the landing, when a terrific squall dropped upon us from the mountains near by, and almost lifted us out of the water. The waves hissed by and almost laid bare the bottom; when they struck us it seemed like so many Titan sledge hammers trying to shatter the boat. There is probably but one sea in the world where the shock of the waves is so terrific, not from the force of the wind, but from the extreme heaviness of the water. Though the lake has the reputation of being treacherous, we soon learned that it has some very good points. From 5 A. M. to 4 P. M. the wind usually blows steadily from the north or northwest; then there is a calm of an hour or two, when it blows from the south nearly all night.

Our three days' sail of 110 miles was voted a success by all. The breezes were comparatively gentle, not frightening anybody (as they did on a former trip, when the waves were seven feet high); the heat was not intense, the sea seemed so like a fresh water lake, and animal life was so abundant in and around it that we shall never again call this the "Dead Sea of America." MARCUS E. JONES.

Money for the Mines.

While primarily all our money comes from the mines, a good deal has to be expended in order to procure the raw material for coinage. Mining developments in this and adjoining states and territories have, for the last quarter of a century, been mainly carried on through incorporated capital, or rather through incorporations that call in their capital as needed, by means of assessments on outstanding shares. During the current month twenty-three assessments will become delinquent at the respective offices. Seven of these mines are in Nevada, twelve in California, one in Utah and three in Mexico. It is noteworthy that, so far as known at this office, no assessments are to become delinquent this month on mines in Arizona, Dakota or Idaho, though it is possible there may be some in each of these sections. The Mexican Mining Company is calling for the largest amount of money this month. The stockholders in this mine have paid up quite generally and promptly heretofore, and it is presumed they will respond to the present call in the same way. Following is a list of the assessments to become delinquent during the month of October:

Name.	Per Share.	Amount.	Del. Oct.
Best and Belcher	$0 50	$50,400	24
Campo Seco Copper	10	10,000	1
Con. Amador	50	15,000	20
Con. Reforma Lead	15	4,500	17
Christy M. and M.	20	12,000	31
Day	30	30,000	15
Detroit Copper	10	5,000	22
Double Standard	10	5,000	..
Eintracht Gravel	5	5,000	17
Eureka Consolidated	1 00	50,000	22
Gorilla M and M	10	5,000	3
Hale and Norcross	50	56,000	16
Mexican	1 00	100,800	23
McClinton	5	3,000	4
Mt. Potosi Con	25	25,000	30
Pleasant Valley	15	15,000	16
Red Hill Hydraulic	5	5,000	5
Ruby Gold Gravel	25	25,000	30
Silver Hill	5	5,400	8
San Miguel and L. T.	1 00	50,000	11
Trinity Gold	10	3,000	22
Winthrop	25	2,500	23
Yaquai	10	5,000	17

The Best and Belcher, Hale and Norcross, Mexican, and Silver Hill mines are in Storey County, and the veterans in the assessment field, having levied 27, 78, 24 and 19 assessments respectively. The Hale and Norcross is the only one of the five that has paid dividends, and the account between that mine and its stockholders runs somewhat as follows:

Assessments levied	$4,174,000
Dividends paid	1,598,000
In debt to stockholders	$2,576,000

The other three mines have been a dead loss to stockholders from the start. The amount of the respective levies has been as follows:

	No.	Amount.
Best and Belcher	27	$1,446,600
Mexican	24	2,909,800
Silver Hill	19	1,819,800
Totals	70	$6,176,200

These mines are apparently just as far from reimbursing stockholders as at any time in the past five years. How much longer they will be able to collect capital in this way without making any returns it is impossible to say, though it is evident that unless there shall soon be something more encouraging in sight than at present appears in the Comstock mines, it is going to be more difficult to collect assessments than it ever has been.

The other three mines in Nevada are the Day, in Lincoln County, Eureka Consolidated, in Eureka County, and Mt. Potosi, in Esmeralda County. This is the sixtb assessment on the Eureka Consolidated, and the total is $300,000. The mine has paid seventy-five dividends, amounting to $4,817,500. The Day has levied thirteen assessments of $190,000, and the Mt. Potosi ten of $200,000. Neither mine has paid a dividend. Four of the California mines are in Mono County. These are the Detroit copper, Double Standard, Gorilla and McClinton. This is the first tax on the Detroit, and the amount is estimated. It is the only copper mine in that county, so far as we know. The Double Standard has made six calls on stockholders, amounting to $52,500; the Gorilla, two, both this year, amounting to $10,000, and the McClinton nine, amounting to $116,000. The Eintracht Gravel and Ruby mines are in Sierra County, and the former has levied thirteen and the latter nine assessments. The Campo Seco copper mine, in Calaveras County, has levied two assessments this year, both of which are estimated at $15,000. The Consolidated Amador is in Amador County, and used to be the banner quartz mine of the state. As the Amador and Consolidated Amador it has paid several hundred thousand dollars in dividends. This is the sixth assessment under the present organization. The Pleasant Valley mine, in El Dorado County, paid several dividends last year, and this year has levied two assessments of $30,000. The Red Hill hydraulic mine, in Butte County, has levied nine assessments. This is the first assessment on the Trinity, in Trinity County, and the Winthrop, in Shasta County. The Christy mine, in Washington County, Utah, makes its first demand on stockholders this month, after paying several dividends. The Consolidated Reforma lead mine is in Mulege district, Lower California, and this is the third assessment. The San Miguel and La Trinidad mine is in Chihuahua, Mexico, and this is the third assessment, and the Yaqui mine is in Sonora, Mexico, and this is the second call. The money demands of the mines will be apportioned as follows:

Nevada—		
Storey County	$212,600	
Eureka	50,000	
Lincoln	30,000	
Esmeralda	25,000	$317,600
California—		
Mono County	18,000	
El Dorado	15,000	
Amador	15,000	
Calaveras	10,000	
Sierra	7,500	
Butte	5,000	
Trinity	3,000	
Shasta	2,500	76,000
Utah		
Washington County	12,000	12,000
Mexico		
Chihuahua	50,000	
Sonora	5,000	
Mulege District, L. C.	4,500	59,500
Totals	$465,100	$465,100

For the corresponding month last year, 26 assessments became delinquent, amounting to $503,900. Assuming that all the assessments levied on mines to become delinquent in the first ten months of the year have been or will be collected, the amounts may be apportioned as follows:

	1882.	1883.
Nevada	$4,383,825	$3,690,590
California	1,116,117	1,136,044
Dakota	95,000	.....
Arizona	220,450	142,000
Utah	30,000	32,000
Idaho	19,000	.....
Alaska	23,000	19,750
Mexico	95,800	197,500
Totals	$5,782,452	$5,217,884

For the same time in 1882 the amount was $7,817,800, against $11,179,400 in 1880, and $13,137,600 in 1879. We are not levying any more than half as much as we did three years ago, and it is safe to say that the proportion of the levies collected is much less. We know of several instances of default this year, and some of them for large amounts. But as all the assessments levied do not come under our observation, the omitted levies will probably make good the delinquencies in those reported. There certainly must have been some levies in Dakota and Idaho this year, and more in Arizona and Utah than we have reported above.

THE BIG ENGINES.—About 13 of the big engines are going to be put to hauling freight in the mountains between Truckee and Rocklin very soon. There is to be a new departure in the manner of hitching up the trains from anything ever practised on this coast. Instead of putting all the engines ahead, they will be divided, and one or two put in front and one behind. In order to do this the cabooses must be changed and have powerful buffers. The pilots of the engines are also being changed, and "stub pilots," as the boys call them, are being put in, so as to let the engines close up to the car they are coupled to. This permits the use of a link in coupling, instead of a draw bar, which might double up. Mr. Cooley, the master mechanic, says the engines are all right and are a complete success on the Tehachipi hill, and will be here. They pull 15 cars, while 2 of the old engines will pull 16. The big mammoth engine now building will be out in about two months.—*Reno Gazette.*

The Oil Interest of Southern California.

Few persons who have not given especial attention to the oil interest in this portion of the state realize its importance. A casual trip only through the region in which the oil developments are being made gives no idea of the results already accomplished. Take the Newhall or Pico district, for instance. The oil output of this district has averaged during the last year more than 1,000 barrels per day, of an average value of $2 per barrel, or in round numbers 365,000 barrels per year, of the total valuation of over $700,000. All this has been derived from a very limited area of territory, not over 1,000 acres all told.

So great has been the success of the parties who have inaugurated this enterprise at Pico, that they have determined to enlarge to an enormous extent their field of operation, and take in the whole of the Santa Clara Valley, containing an oil area of many hundreds of thousands of acres. Already have they formed corporations for pipe lines down the valley to Ventura, and the pipes are laid from Santa Paula down to the sea. In addition, there is piled up at Newhall large stacks of pipe, which would seem to be more than enough to pipe all the way from Newhall to Santa Paula and connect the wells already productive with the sea.

Companies of parties from Pennsylvania have been formed for putting down additional wells, and derricks are rising in all directions on the mountain sides of the Santa Clara. There are also piled up at Newhall large piles of pipe, six, seven, and eight inches in diameter, to be used in casing wells now being put down, or to be put down in the immediate future. The indications now are that more than one hundred wells will be put down in this valley alone in the next six months, and the output more than doubled.

Already is this the second oil-producing field in this country, and with the energy and pluck now being shown, it will not be many years before Pennsylvania, so long the oil monarch of the world, will be obliged to look to its laurels.

This increased development can be of incalculable value to our sister county, Ventura, and to its principal port, San Buenaventura. With a million or more of dollars flowing into it from its oil exports, with the increased valuation given to its productions by a home market established by the oil industry, Ventura County must, in the immediate future, receive a boom which will add a greatly increased value to its lands and prosperity to its people.

Without any jealousy of Ventura and its riches, we can call attention to the fact that the surface indications of oil in Santa Barbara County are every whit as good as those in Ventura, and that beyond question oil lies within the limits of this county, only needing stirring activity and business energy to bring it forth. Who will inaugurate this enterprise and put down a well, not 200 feet deep, but 2,000 feet, if necessary? There may be risk, but if successful the result will more than compensate for the risk run.—*Santa Barbara Independent.*

Wyoming Oil.

In the Sweetwater country in Wyoming, there are large deposits of petroleum. Dr. G. B. Graff, of Omaha, several years ago improved the springs there by digging some reservoirs to collect the oil and store it to hold for market. This oil has been used for several years for lubricating axles and machinery on the Union Pacific, and has gained a fine reputation for its excellent qualities. To make the oil property profitable, Dr. Graff has been engaged in organizing capital to develop it, and the result of his labors are set forth in the Omaha *Bee*, as follows:

"Dr. Graff, of Omaha, who is engineering the development of the oil field of Wyoming, has returned from a visit to England, where he is supposed to have secured the necessary capital for active work. The company, of which he is the working head, proposes to erect a large refinery at Point of Rocks Station, which is situated sixty-nine miles south of the oil fields. This will have a capacity of 3,000 barrels of refined kerosene per day. A pipe line will be built to the wells, at a cost of $225,000, to convey the crude oil, and bull trains will also run between the wells and Point of Rocks, transporting lubricating oil.

"The oil, in transit through the pipe line, will have to be carried over an elevation of 2,000 feet, but heavy pumps will do the work. Dr. Graff expects to have the pipe line in operation this fall, and the refinery under roof. A Pennsylvania expert, who recently examined these oil fields, thinks that the oil, if found in the paying quantities he anticipates, will be used principally as fuel for smelting the ores which are found in such abundance in the mountains of the territory. Smelting is now a very expensive process, as coke ranges in price from $25 to $80 per ton. Petroleum produced at the price now ruling in this region would cost but $7 per ton, and a ton of petroleum would do about three times the work of a ton of coke. It would undoubtedly, in time, prove a vigorous competitor of Pennsylvania oil for lighting purposes, as refined petroleum now sells in the territory at 20 cents per gallon. With continued growth of the West, there will be no lack of a home market for all that can be produced."

MECHANICAL PROGRESS.

The Cost of Wrought-Iron Framing.

Mr. P. Barnes, in an article in an exchange, remarks that it is a fact quite worthy of note in connection with the use of wrought-iron bars and plates, in the more modern designs of roofs and other similar framed-work in buildings, that the amount of what may be called blacksmith's work, or forged pieces, has steadily diminished in quantity and complexity, until now there is very little of it left. This fact does not by any means indicate that the fitting or joining of the parts has been slighted or been done carelessly, but it is due to the constant study of those who plan such work to simplify the whole, so that the usual range of work called for may be reduced in cost to the lowest practicable limit, and also, an equally important thing, so that there may be the largest possible inducement for the use of such work in new directions.

This need of simplicity of construction and of reduced cost has led to the furnishing by many rolling mills of bars of a great variety of forms, so that in the use of them, even in a complicated piece of framing, the only hand labor that need be done is found to be the bending, or twisting, or flattening out of these bars, all of which can be done at a comparatively low heat, and by men of very moderate skill. The joining of such parts has come to be almost wholly a matter of the fitting of plain pins, turned for the more important work, and the driving of rivets, all of which involve care and skillful oversight, but no special skill on the part of the individual workmen themselves. For some of the tension rods and similar parts of iron frames there will probably always be some welding needed, as these members are usually made of the best iron, and hence, to save cost, must be kept as light in weight as possible. Hence the need, in the ends of these parts, for joining them one to another, of a welded eye, so that the fullest strength shall be maintained for the size of the bar used, or, more correctly, so that the full strength shall be preserved throughout every part of it when made up into the finished form. In the forming and welding of these eyes, the smith's work is of the most elementary sort, the bending of the end back upon itself and the making of the simplest form of a scarf weld being the whole of it.

The great care which has thus been given to these details of design, both in the ideas involved in the combination of parts and in the putting of them into the forms of actual construction, has led to very large reductions in cost price of all such work, and hence to an expansion of the business of making wrought-iron framed-work, which is nearly incredible, even to those who have been familiar with each step of this advance during its progress.

Transmission of Power.

The distance to which wire-rope transmission can be applied ranges from fifty or sixty feet up to miles. "As a magnificent example of long transmission, we would mention that of Schaffhausen, in Switzerland, at the falls of the Rhine. Here eight hundred horse-power is carried diagonally across the Rhine, and extended for a distance of two miles and distributed among fifty different manufactories, situated in every imaginable position and embracing all the varied arrangements of changing directions."

Wire-rope transmission comes into use at the point where a belt or line of shafting becomes too long to be used profitably; and in point of economy it is much cheaper than its equivalent in either shafting or belting. This method has been largely introduced with great success in Europe for several years past, and is now receiving a rapid development in this country.

Power can by this method be transmitted in any desired direction, up or down hill, across rivers, around buildings or obstructions of any kind, and thus make available many sources of power which are now useless. The ropes hang free in air, and require no protection from the weather, excepting an occasional coat of warm coal-tar, which can be applied to the rope by pouring from a can into the groove of the wheel while running; or raw linseed oil can be swabbed on the rope to keep it from rusting, and thereby preserve it.

In the neighborhood of Frankfort-on-the-Main, in Germany, the power of a hundred horse-power turbine is conveyed for a distance of 3,200 feet, by means of a wire-rope transmission, to a cotton factory located in the proper place, for such a building—wheels of thirteen feet and a half; size of rope, five-eighths inch. A nearer site for a building could not be found, and this was the only way in which the power could be made available for that purpose.

Hundreds of cases similar to the above might be referred to in Europe, where permanent rope transmissions are numbered by thousands.—*Popular Science News.*

COMPOUND LOCOMOTIVES.—M. Mallet communicates to the French Society of Engineers a note from M. Borodine, giving the results of experiments to determine the relative economy of the simple and the compound system of engine for locomotives. The engines experimented with were those designed for the railway from Bayonne to Biarritz by M. Mallet. The trials extended over a considerable period of time, and the comparisons were made fairly complete. The result showed the compound system to have an economy of from ten to twenty per cent, according to the conditions under which they are carried out. The variation in the ratio of expansion is very greatly restricted in the compound engine. The use of the steam-jackets with which the engines were provided did not prove to be of advantage. The expenditure of steam was greater when they were in use than when they were shut off.

A Wooden Boiler.

While we hear of so many substitutes for wood as to make the hearts of the forest denudation alarmists beat for joy, it is very rarely we hear of forest products being put to a use for which wood has been hitherto deemed entirely impracticable. Such a case, however, has just come to our notice, and strange to say, it is not a Yankee invention either, and did not originate in the Land of Wooden Nutmegs, but is to be credited to the inventive genius of a New Jersey youth. It is said: "A Patterson, N. J., mechanic, named William Sutcliffe, is building a steamboat with a wooden boiler, which will be placed in the Passaic River above the falls in a few days. The boat is a propelier, 16 feet long. The boiler is made of a new alcask, and is said to be capable of standing a pressure of 200 pounds to the square inch. It has already been satisfactorily tested at 40 pounds pressure. This novel boiler is fitted with flues, and the fire, instead of being under, is on top of it, a draught being supplied by a tube from underneath. Mr. Sutcliffe is a thorough and practical mechanic, holding a responsible position in one of the Patterson locomotive works. It is the first time in history that an attempt has been made to raise steam in a wooden boiler, and it looks as if the experiment would prove a success."—*Cotton, Wool and Iron.*

LONG OR SHORT RAILS.—Bearing upon the question of long and short rails, it may be of interest to state that the first line opened in France, viz., that from Saint Etienne to Andrezieux, had rails only 3 feet 11 inches long and weighing 45 pounds. This was in 1828; but in 1832, on the line from Saint Etienne to Lyons, the rail had increased in length to about 14 feet 8 inches and weighed 132 pounds. Various increases were made up to 1855, in France, when the length reached 49 feet 6 inches. England came in with a rail measuring from 21 to 24 feet, with a weight of 110 pounds per 39 running inches. In Austria the Francis Joseph line far exceeded this length, but was one-eighth less in weight. The great objection to the lengthening of iron rail is that the rail exfoliates and is damaged at any point; in fact, the Southern of France Railway Company finds that only one-third of the rails are damaged at the ends. The greater length also involves more labor in the removal and replacement of rails. The use of cast-steel changed the whole question, and now rails are turned out in Belgium and France 85 feet in length. The long rail adopts a curve more readily, owing to the absence of joints. Considering the dilation owing to changes of temperature, the maximum length of a rail in France is thought best to be about 49 feet 3 inches and weighing 110 pounds.

WEAR OF IRON WORK.—In a comprehensive article recently written by Herr Wohler, he enumerates the various kinds of injury and wear to which axles, tires and rails are subject, and remarks that under normal circumstances railway material is not forcibly torn, bent or broken, and that when such violent force is brought to bear on it, then the limit of human precaution has already been passed. On the other hand, he considers that scientific tests have to be arranged in view of those small and sometimes almost imperceptible movements which, by their frequent repetition, affect the durability of the material subjected to their influence. The test applied by the Imperial railways of Alsace-Lorraine, of which Herr Wohler is manager, in the acceptance of axles, involves the sample bar being subjected to a load of 34.92 tons per square inch of the cross-section during ten minutes, without any further extension taking place during that time. If this test is withstood, the bar is subjected to a further weight until it is broken. After being broken, the cross-section of fracture must not exceed 65 per cent of the original cross-section.

PENNING'S STEAM JOINT.—An improved steam and hydraulic joint, invented by Mr. E. Penning, of London, England, attracted some attention at the recent engineering exhibition. According to Mr. Penning's system, the flanges of the pipes are furnished with grooves of a triangular shape, into which rings of a similar section are inserted, forming, when the joint is made, a triangular or wedge-shaped washer, of which the apex is nearest the periphery. The washers are made of prepared or ordinary India-rubber patent packing, asbestos, or any other suitable material. It will be understood that, from the form and position of the washer in the joint, it will resist considerable pressure. It is said to have been tested under a hydraulic pressure of 4,000 pounds, and to have given entire satisfaction.

SCIENTIFIC PROGRESS.

Ancient Glaciation of North America.

While the glacial area on our continent has not been fully explored, there is abundant proof for the following propositions: First, Glaciers covered most of the elevated portions of the mountain belts in the Far West as far south as the thirty-sixth parallel, and in the eastern half of the continent to the fortieth parallel of latitude. Second, The ancient glaciers, which occupied the area above described, were not produced by local causes, but were evidences of a general climatic condition. Third, They could not have been the effect of a warm climate and an abundant precipitation of moisture, but were results of a general depression of temperature.

The traces of glaciation are similar in kind and apparently in date over the whole area; they are therefore effects of general, not of local, causes. East of the Mississippi the evidence is even more widespread and impressive than in the Far West. The area bearing marks of ice action, and strewn with drifts, extends from New England westward parallel with the Canadian highlands, in a belt 500 miles wide and over 2,000 miles long. Its northern extension has not been traced beyond Winnipeg, but there are reasons for believing that it reached to the Arctic Ocean, and that the great lakes are pre-glacial river valleys, scooped out and modified by ice. Fully half the continent north of the thirty-sixth parallel was glaciated. So far as we now know the glaciation was synchronous.

The iceberg theory was opposed by Dr. Newberry on the following grounds: It postulated a water line with irregularities of level that are irreconcilable. The direction of the scratches and the lines of deviation of the bowlders require that the northern portion of the continent should have been all submerged, leaving no land for the origin and starting point of icebergs. If the icebergs could have been formed and floated, an incomprehensible tangle of ocean currents would be required to account for their movements. The evidence of sea-covering, in the form of marine shells, is totally absent from the great drift area of the interior, while they are found abundantly in the Champlain and bowlder clays of the coast. Finally, the inscription left by the eroding agency is characteristic and *sui generis*.

The record of the ice period on our continent is far more extensive and impressive than it has been represented. The phenomena were due to an extraneous and cosmical cause, not to any local or even telluric. The question here passes from the geologist, and must be addressed to the astronomer. Professor Newberry briefly recapitulated some of the theories which have been suggested by Croll, Newcomb and others to account for the glacial epoch.—*J. S. Newberry, of New York, in Science.*

The Comet.

The comet recently detected by W. R. Brooks, at Phelps, N. Y., has become an object of unusual interest since its identification with the comet of 1812, the return of which has been anticipated about this time.

The comet has exhibited phenomena of great interest in regard to the development of its structure, by its approach to the sun. When first observed this year, it was a very faint and small nebulous object, but the appearance of a stellar nucleus was noted. The nucleus was afterwards less distinct. This may have been due to unfavorable conditions of observation, or it may possibly indicate a preliminary series of changes like those which the comet has just exhibited. On September 21st, as seen at Harvard College Observatory, the comet was still very faint. A slight condensation at one place could be seen with the large equatorial, but this could hardly be called stellar. The next night, September 22d, the appearance of the comet had so completely changed that it was difficult to believe it the same object previously seen. It now resembled a star nearly as bright as one of the eighth magnitude. Very little nebulosity could be detected about it, but some was seen early in the evening, while the comet was sufficiently high in the sky. During the evening it appeared to be gaining perceptibly in brightness. The next night, September 23d, it was seen at times between clouds, and was found to have again changed its appearance. It was now even brighter than before, although still slightly inferior to a star of the eighth magnitude, but it had lost its stellar appearance, and had become blurred, regaining the ordinary character of a cometic nucleus. Traces of the development of a tail were also perceptible. The rapidity of this series of changes is very unusual, if not unexampled.

The comet will doubtless soon become visible to the naked eye, and will prove an interesting object; but from its position it can not be expected to rival the beautiful comets of recent years either in proportions or brilliancy.

MEASUREMENTS OF THE DEPTH OF SLEEP.—Two of Vierordt's pupils, Monninghoff and Piesbergen, have made the depth of sleep the subject of an investigation. They worked upon the principle that the depth of sleep is proportional to the strength of the sensory stimulus necessary to awaken the sleeper, that is, to call forth some decisive sign of awakened consciousness. As a sensory stimulus they made use of the auditory sensation produced by dropping a lead ball from a given height. The strength of the stimulus was reckoned, in accordance with some recent investigations of Vierordt, as increasing, not directly as the height, but as the .59 power of the height. For a perfectly healthy man, the curve which they give shows that for the first hour the slumber is very light; after 1 hour and 15 minutes, the depth of sleep increases rapidly, and reaches its maximum point at 1 hour and 45 minutes; the curve then falls quickly to about 2 hours 15 minutes, and afterwards more gradually. At about 4 hours 30 minutes, there is a second small rise, which reaches its maximum at 5 hours 30 minutes, after which the curve again gradually approaches the base line until the time of awakening. Experiments made upon persons not perfectly healthy, or after having made some exertion, gave curves of a different form.

Photographing Reichenbach's Flames.

The question of the actual existence of these flames surrounding the poles of powerful magnets has again been brought up for discussion in scientific circles. Numerous persons have claimed to be able to see them, and some even to be able to distinguish between the poles and color of the flames. Reichenbach himself attempted to photograph them by the daguerreotype process, but was apparently dissatisfied with the results he obtained. Mr. William Brooks has taken the matter up, and thinks he has obtained actual impressions of the flames, by means of photography, on sensitive dry plates prepared especially for the purpose. In total darkness a perforated blackened card was placed one-eighth of an inch above the poles of a permanent horseshoe-magnet, and a sensitive plate placed an eighth of an inch above the card. With five minutes' exposure he obtained a result; and this was repeated many times, the most remarkable thing being that sometimes he obtained a positive and sometimes a negative image, under precisely the same conditions. Another curious effect obtained was, that some printed matter, which was under the wash of Indian ink, used to blacken the card, was perfectly readable when the plate was developed. This latter result, however, was obtained on only one occasion. He also succeeded in obtaining prints through a glass plate on which were painted figures in black varnish. This was contrary to the experience of Reichenbach, who considered that the rays were not transmitted through glass.—*Science.*

PRIMEVAL TINDER.—There are some kinds of mushrooms, notably the woody and leathery ones, that no more suggest ideas of a meal to us than a log of timber or a pair of old boots do. But if we do not think of eating them, we can fashion them into excellent razor strops or other useful articles on occasion. Several polypores make first rate tinder, and for such purpose they have undoubtedly been used from very remote times. We infer that fires were kindled by their means in the ancient Swiss lake dwellings, from the fact that they occur among the remains in almost every one of these old habitations. The common tinder polypore has also been found in the lake dwellings at Lochlee, in Ayrshire. Perhaps they may have been put to some other use. These old lake dwellers were probably not without their vices, and may have pounded polypores to dust and snuffed that up as eagerly as certain natives of Northern Asia do at this day.—*Good Words.*

THE discovery of M. Heddehault is proving of considerable value. When cotton and wool are combined, he subjects the material to superheated steam, under a pressure of five atmospheres. The wool soon melts and falls to the bottom of the vessel, leaving the cotton or other vegetable fiber clean and in a condition suitable for paper-making. Afterwards, the melted wool is evaporated to dryness, when it becomes completely soluble in water, and is called azotine—a substance very rich in nitrogen, and of great agricultural importance.

MICRO-ORGANISMS IN WATER.—Osmic acid possesses the property of hardening protoplasm, hence microscopists make use of it for detecting animalcules in water. According to L. Maggi, the chloride of palladium may be substituted for the more poisonous osmic acid, an acid more dangerous than prussic acid. By adding to the water a solution of palladium chloride (one in eight hundred), he obtained a precipitate in which the bacterial forms could be recognized under the microscope just as distinctly as in those obtained with osmic acid.—*Gazz Chim.*

TESTER'S TELEPHONE.—M. Tester, of the French Telegraph Administration, has devised a magnetic telephone which has given good results. It resembles a watch, with the glass replaced by an ebonite mouthpiece. The iron plate vibrates before a double magnetic ring, having projections like the indented edges of two concentric cups. The magnetic polarity is different in the two rings, one ring presenting north and the other south poles. Each ring is provided with a fine coil of wire, and the entire magnetic field is traversed by the current.

THE Humanitarian Invention Association of Youngstown, O., has offered a premium of $3,000 for the best and most practicable invalid chair for the use in homes, hospitals, and public conveyances. An exchange says this premium ought to be won by some bright woman with inventive faculties and a practical experience in the sick room.

Mining Share Market.

Aside from the fluctuations which our stock tables show, there is little to record of the mining share market. In fact, stocks have very little animation in these days, and attract comparatively little attention from the public. No doubt, however, should rich ore be struck at any important point in the Comstock, there would be a revival of interest.

The showing in the joint Union Con. winze is said to be good, as is that at the north end of the Sierra Nevada.

The station for the new hydraulic pump at the Chollar-Norcross-Savage shaft is about completed, and they are now ready to set up the machinery as soon as it arrives.

The Mexican will now very soon connect the raise rom the 2900 with the winze down from the 2700 evel. Active prospecting will then be in order.

At the Imperial, a working station is being cut out at the 600 level. From this a drift will soon be started west. All the ground is virgin from the surface down to the 900 level, (has never been passed through by a drift) until the workings of the old mine (well out west) are reached, therefore there is a chance of finding a front ledge of some kind.

At the Gold Hill mines some work is being done at present, but a full force of miners will not be put on until the mills can take the ore.

Excellent headway is making in draining the Alta. The time is not now far distant when the miners will again be at work in the lower levels.

Bullion Shipments.

Ontario, Oct. 10th, $5,086; Horn Silver, 10th, $12,000; Vienna, 10th, $2,596; Hanauer, 11th, $8,520; Alice, 11th, $23,024; Ontario, 11th, $5,052; Alice, 12th, $16,293; Ontario, 12th, $5,407; Horn Silver, 12th, $12,000; Vienna, 12th, $2,864; Belleville, 12th, $1,993; Hanauer, 13th, $5,545; Horn Silver, 13th, $12,000; Ontario, 13th, $5,367; Stormont, 14th, $3,465; Hanauer, 14th, $2,483; Alhambra, 1st, $3,167; Mt. Diablo, 8th, $7,327; Bodie, 15th, $10,190; Northern Belle, 15th, $6,658; Contention Con, 13th, $15,523; During the week ending Oct. 13th, there were shipped from Salt Lake 45 cars of bullion, 1,183,044 pounds, sent East; 13 cars of ore, 376,170 pounds, sent West; 1 car of ore, 24,440 pounds, sent East, and 1 car white lead, 24,900 pounds, sent West, making a total of 61 cars, aggregating 1,608,554 pounds.

MODEL VETERINARY SCHOOL.—The Berlin Veterinary School was attended last winter by 247 matriculated students, the largest attendance during the century of its existence. The main building, with its three leeture halls, its large, well stocked library, and numerous lodgings for officials, etc., contains also an extensive anatomical department, with very valuable collections. The pathologieo-physiological institute connected with the establishment is situated in one of the new wings. The dog hospital, the horse hospital, the operating rooms, riding school, smithy, etc., are considered the best of their kind. In the cow stables are to be found the favorite races of all countries, partly for purposes of instruction, partly for the use of the dairy. The horse hospital can accommodate 100 sick horses. In it there were treated in 1882 no fewer than 2,241 animals; 600 were examined and dismissed; 7,085 sent to the polyclinic. In the stationary dog hospital 1,200 patients were treated; in the polyclinic, 3,215.

IT is stated that the Mexican Government has negotiated a loan of $10,000,000 with Americans and Germans, the bonds to be taken at eighty-four cents on the dollar, bearing nine per cent interest.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

A NEW STRIKE.—*Ledger*, Oct. 13: A strike which promises to be of much importance was made at Middle Bar last week, on the Wetzler claim, which joins the Mammoth on the south. The mine has recently been bonded for one year. We have seen samples of the ore. It is very similar in appearance to the rich ore met with in the Mammoth. It is decomposed quartz, carrying a heavy percentage of free gold. The value of this discovery cannot be ascertained at present, but it is not improbable that another rich deposit of gold has been stumbled upon.

Calaveras.

EMPIRE.—*Chronicle*, Oct. 13: The Empire gravel mine, in Old Woman's Gulch, run by the Cook Bros., is showing up well. The batteries of the mill were cleaned up the other day, after a six days, run, and the yield was over $600. The expense of getting out the gravel and milling it was $180, leaving a clear balance of $420. Ten men altogether are employed.

LEAVITT.—We were shown during the week some very rich quartz specimens from the Leavitt. This mine is near the Mokelumne River, a mile and a half from this place. The rock, which was taken from near the top of the lead, carried plenty of free gold. Considerable work in the way of prospecting the lead has been done of late.

CARSONS.—*Mountain Echo*, Oct. 11: The old and dilapidated town of Carsons is on the eve of a mining boom. A new forty-stamp mill has recently been completed on the Reserve mine, and is the finest mill ever erected in this county. William Irvine, Supt. of the Morgan, is building a mill, which will start with ten stamps but have a capacity for ten more if required.

El Dorado.

CANYON CREEK.—Georgetown *Gazette*, Oct. 12: It is rumored that a movement is being made towards the consolidation of all the leading seam-mines at Georgia Slide and the Canyon Creek mining property. As it now is, although the mines are paying very well, they are being worked under great disadvantage, on account of depth. All who are acquainted with these mines are satisfied that in connection with the Canyon Creek property no better investment can be found. The old Parsons mine alone would pay handsomely upon a tunnel from Canyon Creek.

ANOTHER SEAM.—Bill Lane has a seam-mine down in the bonanza neighborhood, a mile south of town, which is showing good prospects. He has two men at work sinking.

VOLCANOVILLE.—R. G. Hart, formerly manager of the Josephine quartz mine at Volcanoville, has purchased the Flora gravel mine, near that place, which he has been working for the past six weeks, with a force of 10 men. We learn that the force is to be immediately increased to 25 men. The mine is worked by drifting. The gravel deposit is immense.

MELTON.—Placerville *Republican*, Oct. 11: Since the return of Supt. McClellan, of the Melton mine, at Grizzly Flat, from the East, the mine has been running full-handed, and work is being pushed.

Inyo.

ELGIN.—*Independent*, Oct. 6: Baker, Keys & Barnes, of the Elgin mine, Beveridge district, last week cleaned up a short run of their arastra. Eight tons of ore yielded 40 ounces of gold, worth at the mint $16.75 per ounce. They will on Monday begin the construction of a trail to the McEvoy mill, and purposes hereafter to keep that institution running on $70 free-gold ore.

BULLION SHIPMENT.—Hupert Farians made a clean-up the other day at the Lasky mill, Beveridge district, by which he obtained 136 ounces of gold, valued at $2,100. This was the yield of 75 tons of ore.

BEVERIDGE DISTRICT.—Topographically, Beveridge district is the roughest in the state. Nevertheless, its output of gold bullion has been constant for years, first as that produced by a number of arastras, then of a 5-stamp mill, now of 2 such mills and a steam arastra.

BENTON.—The Eureka mill at Montgomery has been running steadily; also the Diana. At the Indian Queen, the 1600 ft tunnel is nearing the end. There is considerable deep prospecting going on all around. The mines and mill at Clover Patch will soon be "booming" again.

THE NEW FURNACES. In answer to inquires we can say that the indications are that both will fire up inside of 3 weeks. Ore from Cerro Gordo, and all needed supplies, are on hand and being received at the Swansea furnace, sufficient for quite a run.

ORE SALE.—Ten tons of silver ore from the Indiana mine, Swansea district, of the assay value of $4,600, were recently sold in San Francisco, for $3,200 net. Daniel Meyer & Co. were the purchasers, and the ore is to go to Europe for reduction.

Mariposa.

COULTERVILLE.—Cor. of *Herald*, Oct. 12: The Virginia or Coe mine will resume work in a short time, and the Cook mines have a prospect of starting work again. At the Red Cloud, the workmen have the machinery all in place. They are soon to commence crushing ore from the Red Cloud vein, which is very rich. The mode of reduction and amalgamation is new. Mr. Reardon, the Supt. and inventor of the amalgamator, is sanguine. The Banderita and Compromise are both running full-handed. The Shimer mine will be started up soon.

CANNON MINE.—This mine, situated near the Diltz, was worked by Mexicans in 1851. They used arastras, and a tradition is that a large amount of gold was extracted, and the Mexicans left it through fear of Indians. Preparations for opening up this mine have been made by Captain Diltz. The work of sinking a new shaft will be commenced immediately. Rich specimens have been found upon the old dump used by the Mexicans. The vein matter between the walls is fifteen feet thick, and shows a solid vein four ft wide.

Mono.

MAY LUNDY.—Homer *Index*, Oct. 13: No material change in the upper workings of May Lundy, but all the stopes are looking well. The lower levels show marked improvement. Fifteen feet below the floor of the lower or main tunnel an ore vein 3½ ft in width was unexpectedly encountered during the week, coming in from the southeast. An upraise has been started to tap this vein from the 90-ft level of the winze.

LAKE VIEW.—The incline sbaft following down the west ledge in Lake View is down 20 ft, and ore is being taken out to the southward, the breast carrying 2 ft of clean milling ore of high grade. The ore vein in the bottom of the shaft is 2½ ft wide. The incline shaft in the lower or easterly vein is down 25 ft, and carries 3 ft of good ore.

JACKSON.—The tunnel in the Jackson was advanced 10 ft during the week; total length, 125 ft. The course of the adit has been changed so as to follow the vein which recently came in from the south. In the present face this vein carries 12 in of very rich ore, and is steadily increasing in size and strength.

GORILLA.—The Gorilla mine and reduction works are crowded. Two feet of very rich ore is being followed by a drift from the winze at a point 120 ft from the surface and 300 ft above the lower tunnel.

STANDARD CON.—Bodie *Free Press*, Oct. 9: During the past week there were 1090 tons of ore sent to the mills. The bullion shipment amounted to $33,555.90. The east cross-cut, 1200-ft level, is in 580 ft; progress, 15 ft.

BODIE CON.—During the week 140.615 tons were sent to the mill, and 147 tons were crushed. The average assay value of the pulp was $34.66 per ton. The tailings was valued at $5.88. The bullion shipment was valued at $10,199.54.

Nevada.

EMPIRE.—Grass Valley *Transcript*, Oct. 10: The new mill of the Empire mine is nearly complete; about 2 weeks will find it perfect. The beavy timbers that support the batteries are being put in place, and all of the old timbers, inside of the mill are being replaced by new ones. The new self-feeders bave arrived. A "Triumph" concentrator is at work in the mill. In all probability the Empire Co. will adopt the Triumph. The mine is looking well underground, and the company are sinking for the purpose of opening up a 1400 level.

MT. AUBURN.—*Transcript*, Oct. 14: The Mt. Auburn mine is now being worked full-handed. Marked improvements have taken place in the appearance of the ledge within a few days. The Mt. Auburn has never looked so well as it now does.

PEABODY.—Grass Valley *Union*, Oct. 13: Work in the Peabody mine is now going on regularly. The drift in the first level below the drain tunnel has been extended 30 ft in a northwestly direction. The ledge is showing to the width of 9 inches. The new prospect shaft which is being sunk on the old Eureka ground has reached a depth of 90 ft, from which some good quartz has been taken.

Plumas.

CROMBERG.—Quincy *National*, Oct. 13: Paul Willet has discovered a rich quartz ledge a mile from Poplar Valley. He took out one mass of quartz that yielded $300 when crushed. I hear that some Pittsburgh men are going to take hold of the mine. The Consignee mine is running along all right. The large reservoir of Tefft & Evans is being pushed along as fast as possible. Mr. Bennett, brother of T. D. Bennett, of Mohawk, is running a prospect tunnel half a mile east of the Jackson claim. He has gone over 200 ft through solid bed rock, and thinks he will strike the channel by the 1st of Dec.

RICH GULCH.—Greenville *Bulletin*, Oct. 10: Angus Cameron reports the prospect over at Rich Gulch to be first-rate. The ledge in which Halstead and others are interested is 30 ft wide, and specimens of ore taken from it are immensely rich. By next spring there will be a big mining boom on that part of the river, and mines will be opened that will rival in richness the Eagle Gulch or Four Hills mines.

EMERALD MINES.—These are three ledges, owned by a corporation, of which Hardgrave is Pres. The most important is No. 2. This is a fine ledge, standing nearly vertical, with well defined walls, and bids fair to create a boom for Plumas. The extent of the pay chimney is not known, but it has been sufficiently developed to justify the building of a ten-stamp mill, there being an abundance of water for milling purposes.

San Diego.

SHENANDOAH.—National City *Record*, Oct. 11: While in San Diego, Saturday, we had an opportunity to examine some of the rich gold-bearing quartz from the Shenandoah mine of Mesa Grande. These specimens have been examined by experts and pronounced good for $1,000 a ton. They are now at the depth of 140 ft, and the ledge, which grows richer, has an average width of 2 ft.

Shasta.

IGO.—Cor. *Courier*, Oct. 13: Our town has been visited of late by a good many mining experts, looking for mines to invest in. All the arastras on South Fork are now running and yielding metal. The Hardscrabble mine will start up as soon as there is sufficient water to run the same.

Sierra.

RUBY.—Sierra *Tribune*, Oct. 11: H. Fowler was down from the Ruby mine Monday, and gave us the particulars of the recent rich strike. After running the main tunnel 112 ft north, across the channel, a winze was sunk and gravel encountered at a depth of 4 ft. Ten carloads of dirt were washed that yielded 1¾ ounces of gold, or $3 per load. Another lot of 17 carloads of gravel was then washed, and paid $7 per load. Another winze was sunk 50 ft further south on the channel, and 12 carloads of gravel taken out that yielded $3 per load. An incline has been started on the channel.

COLUMBO.—The company opening the Columbo mine, at Sierra City, are driving ahead as rapidly as it can be done with one hundred men. The mill has been shipped and will arrive soon.

SIERRA BUTTES.—The result of the working for the month of August was as follows: Total receipts, $20,182; total working expenses, $13,303; in addition to which $2,350 was spent on the ninth level, and $4,750 on the new mill.

KANAKA CREEK.—On Kanaka Creek, Fessler & Co., owners of the Bullion claim, are driving ahead their lower tunnel. In a short distance further the

vein will be tapped, when important developments are looked for. There is a fine ten-stamp mill on this property.

BUCKEYE.—The Buckeye gravel mine, at Allegheny, owned by Patton, Hucklebug & Bernhart, continues to yield handsome dividends. A fine lot of course gold was shown a *Tribune* reporter, the result of a recent clean-up.

San Bernardino.

ORO GRANDE.—*Index*, Oct. 13: Five bars of bullion arrived yesterday from Oro Grande, valued at $8,000. The Silver King is turning out an immense lot of rich ore from its lowest levels. About 30 tons of ore are crushed each day at the mill.

STRIKE IN CALICO.—*Print*, Oct. 13: A rich strike was made a few days ago in the edge of town back of the Pioneer House. A wagon road was being built, when a vein was struck, which proved to contain very rich ore. Some parties interested proceeded to dig down to ascertain the extent of the deposit. The indications are good that a rich lead may be developed.

Trinity.

GETTING READY.—*Journal*, Oct. 13: From all sections of the county we hear that miners are preparing their claims for winter work. There appears to be an almost unanimous opinion that the coming season is to be a wet one—plenty of snow, rain and high water; in fact, just such a season as we need in our business at this time. It has been several years since we have been favored with a good mining season.

BULLYHOOP.—From E. Cornell, who visited this mine a few days ago, we learned that the shaft is down 76 ft, that the ledge is 4 ft wide and contains a great deal of very rich rock. He brought us in a piece which shows considerable free gold.

STUYL.—The owners of this mine, Deadwood district, intend erecting a mill, there being a large lot of good milling ore in sight.

NEVADA.

Washoe District.

UNION CON.—*Enterprise*, Oct. 13: The joint Sierra Nevada winze below the 3000 level is nearly down to the 3100. The quartz and ore grow stronger as depth is attained. The ore is almost wholly gold-bearing. It is a pure white quartz, in specimens of which free gold is visible to the naked eye.

MEXICAN.—Are now running a drift from the top of the raise from the 2900 to connect it with the winze down from the 2700 level. The main north drift on the 3100 level is still in favorable ground.

YELLOW JACKET.—Considerable paying ore is found in running prospecting drifts on the Sagebrush level. The regular extraction of ore has not yet been resumed. The Brunswick mill, on the Carson, will soon be ready to start up with steam power, in case there should not be sufficient water in the river.

SAVAGE.—On the 2600 level, at the south line, a west cross-cut was run out 48 ft in quartz giving low assays—from a trace up to $4 or $5.

HALE AND NORCROSS.—The south drift (which is on a curve and will have the effect of a cross-cut, as also is the case in the north drift) is out about 40 ft. It has passed through an outlying stringer that gives good assays.

SIERRA NEVADA. The main north drift on the 2900 level is being rapidly advanced. It has about 50 ft to go to reach the point where a raise will be started to connect with the winze down from the 2700 level.

GOULD AND CURRY.—The east drift on the 2500 level is being pushed ahead at the rate of 50 ft per week in hard porphyry.

ANTES.—Some ore of fair quality is being extracted from the drift north along the west wall. The north and south drifts from the 75-ft station of the winze are passing through favorable material.

COMBINATION SHAFT.—The station for the new hydraulic pump is about completed. It is 80 ft long, 30 ft wide and 15 ft high, and is timbered wholly with spruce.

ALTA.—The water is being rapidly reduced. Changes are about to be made in the pumps from the Sutro tunnel level down to the 1850 level, which will increase their capacity.

CROWN POINT.—Work is gradually being resumed in the lower levels. As soon as the mills can crush the ore a full force of miners will be put to work.

OPHIR.—On the 150 level some old filling is found that will pay for milling.

IMPERIAL.—The main shaft has been put in good repair down to the 600 level, at which point a station is being cut.

CALIFORNIA.—Since setting up the hoisting engine, more rapid progress has been made in sinking joint Con. Virginia winze No. 2.

CON. VIRGINIA.—More rapid progress has been made in sinking joint California winze No. 2 since the setting up of the hoisting engine.

UTAH.—The north drift on the 1350 level is being pushed ahead at the rate of 30 ft per week.

SCORPION.—The west drift on the 500 level is still being advanced in ground of a favorable character.

OVERMAN.—Are extracting some very good ore from the old upper levels.

UNION SHAFT.—Are still engaged in easing timbers at the 2300 station.

BELCHER.—Are preparing to resume the extraction of ore.

THE DEEP WINZE.—*Enterprise*, Oct. 10: Twelve apostles of the science of mining yesterday visited and inspected the development at the bottom of the Union-Sierra-Nevada winze, now about down to the 3100 level. The visitors were fiearly all well pleased. The quartz runs high in gold, and it is said that free gold was seen in some samples. There has certainly been a great change for the better between the 3000 and 3100 levels. It is a fine prospect, and a cross-cut to the west on the 3100 level will soon show the extent, character and richness of the deposit,

The Virginia *Chronicle* says this winze is the deepest point in the earth where gold has been found. The impression has generally prevailed on this coast that silver only is met with at so great a depth, but the fact of native gold being visible in the quartz found at a depth of 3100 ft, scatters all such theories to the wind. A sample of ore was taken by Captain John Kelly from the Union deep winze last Tuesday, assaying $1,100 in gold and a small proportion of silver. The sample was not selected, but was taken from the sackful of ore brought out by Captain Kelly.

Candelaria District.

NORTHERN BELLE.—*True Fissure*, Oct. 13: The upraise above the southwest drift on the fifth shaft level has been timbered during the week, and a small quantity of very good sulphurets obtained. A drift has been started to the east from the main cross-cut on the same shaft level, and has been extended 10 ft. The new cross-cut to the south on the fourth shaft level, has been extended 11 ft, making its total length 42 ft. The ore is of very good grade in the new development above the seventh level, and shows indications of permanence. About 24 tons of ore are being shipped to the mill daily, and both mills are running as usual. A shipment of bullion amounting to $5,149.73 was made on the 8th instant.

COLUMBUS CON.—The work of sinking the Bonanza winze was discontinued a few days ago, and drifting to the west has been commenced. The face of the west drift is streaky and full of lively quartz and bunches of good ore. In the face of the east drift is a narrow streak of mineral-bearing material, which gives low assays,

MOUNT DIABLO. A small amount of ore is being extracted from the drift below the stope from lower winze No. 2. The stope from this winze is yielding considerable $60 ore. The stope below the third level, near the head of winze No. 2, is turning out some $70 ore. The stope near winze No. 1, below the third level, shows a strong bunch of $50 ore. A shipment of bullion was made on the 8th instant, valued at $7,327.14.

Belmont District.

BELMONT MINE.—*Courier*, Oct. 6: Official report of Supt. is as follows: Shaft No. 1 in Laity ground is down 30 ft below first level, showing good ore throughout. First level going south is now 133 ft south of Highbridge shaft, all in ore. The gangue is filled with quartz showing some ore. From winze No. 1, south tunnel, we are raising fine ore. All stopes are producing well. Mill work is progressing finely. We are hauling ore to the mill.

Eureka District.

BAY STATE.—*Sentinal*, Oct. 12: Mr. Daley, foreman of the Bay State mine, told a *Sentinal* reporter on Wednesday that 800 tons of ore had been shipped from the dump and 800 tons more would be shipped to Eureka for reduction. This is ore that was extracted some time ago, and pays for shipment now on account of cheaper rates of freight. It is packed on mules 3 miles to the summit, and hauled thence to Eureka.

SILVERADO.—The tributers at Silverado are doing exceedingly well. New discoveries are made daily, and the ore is so rich that every pound counts. Finn & Sullivan have just made a shipment of 3 tons of ore which worked nearly $300 per ton. The Berrymans are taking out $250 ore from the 400 level of the Rescue mine. Steve Bedell has just made a shipment of $400 ore from his pitch in the Quinn mine, and Pumphrey is sacking bullion from a 10-inch vein in the same mine. Bill Long and Jim Smith are starting in on the "Silver Stone" with a splendid 3-ft vein of rich ore in sight and some 50 tons of good pay rock on the dump.

EUREKA CON.—Within a few months, "Old Reliable" may gladden the public by a resumption of dividends. Every thing about the mine is encouraging for the future, and with the water once under control the company will have rid itself of all drawbacks, and those who now grumble will be made to smile.

Pioche District.

NOTES.—*Record*, Oct. 6: The ore in the Kingfisher mine, having been fairly tested during the week, shows an average of 40 per cent lead and $49 silver. The boys of Poverty Gulch, Comet district, are again shipping rich ore to town and selling it to J. Poujade. The tailing mill, which has been closed down for the purpose of putting in new pan-bottoms, started up Friday. H. H. Chandler is in charge of the mills of both the Christy and Barbee companies at Silver Reef.

Railroad District.

BULLION.—Elks *Free Press*, Oct. 12: C. C. Warner & Co. shipped two cars of bullion, 576 bars, weighing 56,015 pounds, to the Bank of California, San Francisco, since the furnace started up at Railroad, and will ship to-night 266 bars, weighing 26,175 pounds, to the same bank. The furnace has only been running a little over a week.

Tuscarora District.

INDEPENDENCE.—*Times-Review*, Oct. 11: The upraise on the 400 level has been carried up 10 ft the past week, and timbered. Total height, 87 ft. A cross-cut has been started east to connect with the 300 level, and is out 14 ft. Drift north on the 300 level has been advanced 11 ft—total length 845 ft.

GRAND PRIZE.—West drift on the 200 level is in 46 ft. Good sized ledge. Raise above the 300 is up 90 ft; the ledge is irregular; the ore is good. West drift on the 400 is in 47 ft. Some low-grade ore in face of drift.

NORTH BELLE ISLE.—North Belle Isle south drift, 300 level, has been advanced 28 ft. The stopes are producing the usual ore.

ELKO CON.—Since last report, shaft No. 2 has been extended 11 ft. Total depth, 155 ft. There is no material change.

ARGENTA.—North cross-cut on the 400 level is in 128 ft; progress for the week, 11 ft.

BELLE ISLE AND NAVAJO.—Work progressing as usual.

ARIZONA.

GROOM CREEK.—Prescott *Courier*, Oct. 6: Groom Creek is the coming district. It is six miles south of Prescott, in the pine forest, has a great many ledges which carry gold and silver in paying quantities, and is easy of access.

BULLION.—Wagons laden with 20,000 pounds of silver bullion started from the Howell smelter yesterday. Bullion goes to Chicago.

MAMMOTH.—The owners of the Mammoth have incorporated and now propose to open the biggest mine in Arizona. A lot of ore from the Oro Bonito West, Bradshaw district, was brought here yesterday, by its owner, Mr. Able. Its sulphurets are rich in gold.

NOTES.—Prescott *Courier*, Oct. 10: The Dosoris Co. have shipped 55 tons of their richt ore to Pueblo. They expect it will yield $500 to the ton. Twenty-five men are employed. The Peck Co.'s mill is running. Forty-five men are employed. Black Warrior mill is running steadily. Alters & Co. have 6½ tons of good silver ore sacked. It will be shipped to Pueblo. Thirty thousand pounds of bullion were shipped to Chicago Saturday last by the Howell Co. Clark, Supt. of the Arizona Queen Co., has fourteen men at work in the Chicago mine, Groom creek district. Men work eight-hour shifts. The steam hoist is kept busy bringing up water and rock; the latter is rich in free gold. Saulsburry & Co., owners of the Benson smelter, think they will make big money by working the Vulture tailings at Wickenburg.

COLORADO.

BUCKHORN.—*Register-Call*, Oct. 5: One of the most wonderful mineral discoveries on record was made in the Buckhorn mine on Crystal hill, Saguache county, last week. In developing that mine caves were discovered varying from a foot to several feet in diameter, possessing walls of rich mineral. The writer is informed that Senator T. M. Bowen offered Captain Burrows $85,000 in cash for his interest in the camp. Captain Burrows owns one-fourth interest in the Buckhorn. The offer was refused. The Buckhorn has over $200,000 worth of ore on the dump. It is undoubtedly the greatest mine in Colorado.

GOLD BULLION.—Mr. W. J. Lewis brought from the California stamp mill yesterday afternoon 25 pounds 300 ounces—gold bullion, the yield of 70 stamps for one week's running on mill ore from the California mine on Quartz hill. The west 1400 level is turning out mill dirt that averages 10 ounces gold per cord.

ST. JOHN ORE.—A lot consisting of about 1800 pounds of ore from the Gov. St. John mine was sampled at the works on Monday, and gave 115 ounces of silver per ton. The ore was an average of from 15 to 20 tons now on the dump. The St. John will be one of the way-up bonanzas of the camp. At present the ore has to be packed down on jacks, at a cost of $8 per ton.

IDAHO.

ATLANTA.—Ketchum *Keystone*, Oct. 6: The Last Chance mine, known as the "specimen mine," to-day looks better than ever. It is estimated that 2,000 tons of good ore are on the dump, and 500 ft of a solid shoot in sight in the mine. This will be sufficient to run the mill, for 10 years to come, at the rate of 20 tons daily. The ore now worked, though considered as gold ore, carries large quantities of silver. The assay value in gold is an average of $125. The tailings are concentrated. The sulphuret ore assays $300 per ton in silver. The monthly output of the mill is $17,000, and the cost of operation is estimated at $3,400. A brick was recently shipped via Rocky Bar that weighed $5,300 in gold.

MINING SALE.—The Independence and Silver Bullion group of claims, a mile east of the Elkhorn, have been leased to J. M. Reid & Co., who will work the property during the winter and extract ore for reduction at the Philadelphia smelters. The ore is bright galena and carbonates. There are at present on the dump 5 tons that samples 250 ounces in silver per ton. A two-thirds interest in this group was sold out two months since for $250.

DAVITT AND SILVER KING.—Wood River *Times*, Oct. 3: Mr. Scott, of the Davitt and Silver King mines, expresses himself entirely satisfied with his investments. The Davitt, which he bought last February, has yield $45,000 since the end of last April. Within three weeks a new shaft was started on a vein entirely distinct from the Davitt. This shaft is down 50 ft, in ore all the way, which shows widest at the bottom. This new vein can be traced on the surface for 800 ft. The Silver King mine, which he and his associates took hold of about 50 days ago, and upon which they have worked an average of 15 men, has yielded about $40,000.

LOST RIVER.—L. M. Schroeder got in to-day from Corning Canyon, Lost River, bringing with him a 25-pound chunk of ore from a group of 7 mines which he owns there. This chunk is fully 1 ft wide, averages over 50 ounces to the ton, and carries a streak 3 inches wide that goes over 400 ounces. The vein is 2½ ft wide, milling ore. The incline shaft on the Iron King, where the ore is found, is down 20 ft, and the vein well defined.

WHALE.—Challis *Messenger*, Oct. 2: The three smaller veins are combined as depth is attained, and the ore body is now about 4 ft wide, and of a grade that is very easy for a company of miners to bear—$450 per ton, by the mill. This is, without a doubt, one of the great mines of the earth. On the whole, this Yankee Fork country is ripe for success.

MONTANA.

BULLION.—Butte *Miner*, Oct. 3: During the week the shipments through the Pacific Express office were 48 bars, valued at $86,440, which is credited as follows: Alice, 24 bars, valued at $36,528: Donnell, Clark & Larabie, 11 bars, $14,024; Lexington, 13 bars, $25,888.

SHONBAR.—The Co. have 1,500 tons of second-grade ore on the dump, sampling 50 ozs. per ton, besides having taken out and sold ores exceeding $70,000 in value, all of which has been expended in developing the property and putting in machinery. The main shaft is down 310 feet. At the 180-level an east drift has been driven 250 ft; at the 220, another east drift has been driven 300 feet, and an east drift is now being pushed rapidly forward at the 300-foot level. Every level, stope and drift is in good pay.

MOULTON.—Connection was made last week between the winze from the 300 southwest drift and the 400 southwest drift. Stoping has been commenced at the intersection, at which point the vein is four feet wide, and assays 40 ounces. The stopes of the 200 and 300 west drifts continue to produce their usual quota of ore. At the mill, the orehouse is full and the 40 stamps steadily dropping.

A COPPER BONANZA.—Helena *Independent*, Oct. 4: The mines are 130 miles west of Fort Calgary, on the Bow River, and close to the line of the Canadian Pacific railway. They are on what is called the Joe Healy lode, and are exceedingly rich, much of the ore taken out this summer carrying over 80 per cent in copper, besides a paying quantity of silver. The vein is a very strong one, and has been traced for several miles. Its exact width has not been determined, but it has been crosscut from the foot wall 6 to 12 ft, with no signs of the hanging wall, and all the way in solid ore. Judging from surface indications, the vein must be over 100 feet wide, and the ore so far taken out is all free-milling. Mr. O'Connell, one of the locators, says that at places along the lode, which has been taken up for 6 miles, pieces of almost pure copper may be found upon the surface. Capt. Retallic and Prof. Kinahan, who have started upon their return to England, took with them several of these specimens, and also an 80-pound specimen, called "The Baby," which both pronounce the finest and richest specimen they ever saw.

NEW MEXICO.

NOTES FROM KINGSTON.—Cor. of Deming *Tribune*, Oct. 4: The Iron King smelter site has been selected and surveyed. The Monaska is still at the front with plenty of very rich ore. The new machinery for the concentration works has been shipped, and it is now on the road from the East. A. W. Harris, Supt. of the Illinois mine, has four men at work, which force will be increased as room is made. This mine is one of the bonanzas of the district. The boiler and pumping machinery is in place, and ready for operation at the Superior mine. The Iron King Co. contemplate the letting of a contract to sink the main shaft 200 feet deeper. A large body of ore, assaying $150 per ton, was encountered last week in the Iron King. T. F. Chapman, Supt. of the Bullion, will purchase hoisting machinery for the Bullion. The Lady Franklin is producing some fine ore, similar to that of the Bullion and Superior. The Keystone mine on the North Percha is producing some fine ruby ore. The owners have started a tunnel to cut the lead at a greater depth. A double shift has been put on the Big Tree mine, one and a half miles south of town. This is a promising prospect, just opened, and is owned by Dr. Thompson, Baker, and others.

GOLDEN RULE.—Silver City *Enterprise*, Oct. 5: The Golden Rule ledge can he followed easily for 3000 feet, but is only opened for 1200, and for the entire length prospects well in gold. For the 1200 feet, the ledge averages 3 feet in width at the surface, and assays from $30 to $40 in gold. At the east-end shaft miners are cutting a station. The ledge widens down to the first level, where it is 7 feet, and the ore is richer than at the surface. As far as developed, the ledge improved in width and in richness.

STEEPLE ROCK.—The district is in the western part of Grant County, bordering on the Arizona line. The mineral belt is two miles in width, the veins being true fissures, cutting the formation for miles. It is one of the largest mineral belts in the Rocky mountain range, as the veins are plainly traceable above the surface for nearly 30 miles, and in some places are fully 125 feet in width. Nothing so extensive has ever before been discovered, either in this or Arizona Territory, and all that now remains to make Steeple Rock the heaviest producing district in the West is the investment of capital and the working of the mines on an extensive scale.

CARLISLE.—*Tribune*, Oct. 4: At the present time there is over 40,000 tons of pay ore in sight, and if it is found as expected at the 300-foot cross-cut, it will show above 100,000 tons, so that it is practically inexhaustible. The ore is about fifty per cent free. The tailings are concentrated on Duncan concentrators, and there are from 200 to 300 tons of concentrates now on hand. About fifty men are employed.

OREGON.

NOTES.—Jacksonville *Times*, Oct. 5: Supt. Ennis informs us that the Sterling mine will be ready for business again in less than 10 days. Miners are generally preparing for winter, and expecting plenty of water. Chas. E. Chappel & Co., of Star Gulch, are ready for water, having placed their mine in good condition. Isaac Skeeters, of Josephine County, is making arrangements to have a giant put on his claim on Hogue Mountain. Ross & Co. have sent specimens of ore from the Roten ledge, in Willow Springs district, below for assay, and if the report is favorable active operations will be resumed at once. It is likely that the copper mines near Waldo, Josephine County, will soon be the scene of active work. If the company to whom they are bonded do not mean business, there are plenty others who are ready to step in.

UTAH.

CAVE MINE.—Southern Utah *Times*, Oct. 6: The new strike in the Cave mine took place in the original or main drift, and 1200 ft from the entrance; the ore is evidently in large quantity, and assays just double all previous discoveries in the mines. The assay value is 50 ounces silver, 1 ounce gold, and 50 per cent galena, the ore being more properly described as gray carbonate, of extraordinary richness. The company has been shipping about 25 tons of ore per day to the Francklyn and Germania smelters.

WASHINGTON.

CŒUR D'ALENE.—Butte *Miner*, Oct. 3: The Cœur d'Alene placers, which drew stampeding parties from Bozeman and other points, all of which returned with curses for the "crank" Pritchard, seem likely to materialize into something. During the past forty-eight hours direct information has been received in this city which indicates that the placers are fully as rich as has been represented, and that men are taking out from $20 to $100 per day, gold nuggets being found worth up to $48.50. A letter has been received, inclosing one from Pat Magrath, which sets forth the richness of the new diggings in glowing terms. The richest diggings struck so far are on the Mrs. McLean claim, where, on the day before writing, a party of six men had taken out with pan and rocker $600 in dust and nuggets, one nugget being worth $48.50. The digging so far has been only two feet deep. Pritchard Creek is very flat, 25 miles long, and is located its entire length in claims of 20 acres each. There are about 150 men in the camp, and 125 more were expected to arrive from Spokane. The writer don't advise anybody to come in, unless they are well prepared to winter in the camp. The new El Dorado is reached by the Northern Pacific road via Rathdrum, Idaho, from whence it is 80 miles, over a very rough trail, to the mines.

Working Gold-Bearing Arsenical Ores.

Mr. Richard P. Rothwell, of New York, read the following paper on the treatment of gold-bearing arsenical ores at Deloro, Canada, before the American Institute of Mining Engineers, at their Colorado meeting:

The ores treated by the Canada Consolidated Gold Mining Company, at Deloro, Ontario, have been described in a paper read before the Institute in 1881. They are gold-bearing arsenical sulphurets of iron (mispickel), carrying the theoretical proportions of 42 per cent of arsenic, 20 per cent of sulphur, and the remainder iron. The gangue is quartz, calc-spar, and some talcose, slaty rock, evidently resulting from the decomposition of the wall-rock, which on each side of the veins is syenitic granite.

The treatment of the ore consists of (1) crushing; (2) concentrating; (3) roasting; (4) condensing and collecting the arsenic fumes; (5) chlorination of roasted concentrates; (6) precipitation and melting of the gold.

Crushing.

The ore as it comes from the mines is dumped over grate bars at the top of the mill building; what is too course to go into the rock-breaker is broken by band, and all then goes through the No. 1 rock-breaker, which breaks it to a maximum size of 1¾"; then over fixed grate bars, which take out all pieces less than ½" (12 mm.) in size. The coarse then goes through two small rock-breakers, which crush it to a maximum size of about ¾" (20 mm.).

Concentrating.

The peculiarity of the Deloro ore is, that the gold is contained for the most part in the mispickel (which carries, when closely concentrated, nearly $100 per ton as an average); and this mispickel is much more friable than the associated quartz and calc-spar, which contain but small quantities of gold. The consequence is that, when the rock as it comes from the mine is coarsely crushed, we find the fine is composed for the most part of mispickel, and the coarse is quartz with a little mispickel. Taking advantage of this peculiarity of the ore, the mill was constructed so that the ore from the second crushers and the fine from the first crushers would go into the No. 1 revolving screen 20′ long by 5′ diameter, where it would be sized into *fine* (*i. e.*, passing through a mesh of less than ¼" (8 mm.), and the remainder into two sizes, which would go to coarse jigs (Bradford's), which are intended to separate into a rich and poor product, the rich after drying joining the fine from the No. 1 screen and going to the rich rolls to be crushed to the roasting size, and the poor going to the poor rolls and jigs. The object sought to be attained by this arrangement was the partial concentration of the ore without the usual loss in concentration; but as the roasting and chlorinating capacity of the Deloro works is yet far inferior to the mill capacity, it has been deemed wiser for the present to crush in the poor rolls all the ore as it comes from the second rock-breakers, and concentrate it in the jigs. The crushing is done dry in Cornish rolls 36" diameter, 15" face, steel shells on double cone centers.

The ore, after passing through the rolls, is elevated to the two No. 2 dry screens, which have a length of 8′ by 4′ diameter. In these the ore is sized. All passing through a 1½ mm. mesh is carried with a stream of water into the No. 3 screens. The size passing over 1½ mm., and which comes out of the end of the No. 2 screens, drops back into the rolls and goes through again. The fine ore is sized in the usual manner, except that the screens are much larger than usual, for the limiting capacity of such works is always found in the screens. Each set of rolls has a capacity of fully five or six tons an hour in grinding hard quartz and mispickel down from say 20 mm. to a maximum of 1½ mm.

The crushing (and consequently the screening in the No. 1 and No. 2 screens) is dry. The sized ore is concentrated in ordinary Hartz jigs, discharging through the bottom, and the slimes in Spitzkasten and on Rittinger tables. I would prefer other concentrators of greater capacity to these tables, though they do very fair work.

Roasting.

The concentrates are taken from the jig room in a tram car, which, going up an inclined plane, delivers them directly into a hopper over the drying furnace. This is an inclined revolving cylinder 20′ long, 36" diameter at small end, and 48" at large; and it has a conical addition of 24" in length at the small end, making the total length 22 feet. The fire passes through this cylinder, and the capacity has never been tested to anything like its limit, but no doubt it would dry two tons an hour if required. It is very economical in fuel.

As the dry ore drops out of this it is raised in a continuous manner by an elevator into the No. 1 roasting furnace. This is a revolving cylinder 30′ long, 60" diameter outside, lined with 4½ inches of firebrick, and with eight shelves running through nearly from end to end. These shelves are formed of key brick 9" long, so that they stand 4½" out from the lining.

In this furnace the arsenic and the greater part of the sulphur are volatilized, and pass out through a long series of arsenic condensing chambers, and through a centrifugal (Guibal) fan 8′ diameter, 3′ face, used to make the draft to the stack. The ore runs from the first cylinder through a pipe directly into the second cylinder, 20′ long by 48", with a 4½" lining and 6 shelves, where the roast is completed. The escaping gases pass to a stack, which also serves the drying furnace.

The air which feeds the No. 1 furnace is preheated by the escaping gases of the second cylinder, by passing through an air space between the two arches which form the top of the second roaster dust-chamber.

The two roasting cylinders are jacketed, first with an air space, and then with a covering of mineral wool, and paper over that. The whole arrangement of the roasting cylinders, their jacketing, and the plan for utilizing the escaping gases to heat the feed air for the first cylinder, are believed to be new, and are found very economical and efficient in practice.

The jacketing of the roasting cylinder will form the subject of another paper to be read at the next meeting of the institute.

The ability to make a sweet roast (such as is required for chlorinating) in a single operation, in continuous revolving cylinders, has been questioned by some metallurgists. In proof of its feasibility, I may say that, in the continuous arrangement above mentioned, we have roasted ten tons of concentrates in twenty-four hours, and to such perfection that, in the subsequent chlorination by the Mears process, we extracted from 93 to 98 per cent of the gold, as will be seen by reference to the following table:

Roasted Ores.		Average Value Tailings.	Percentage Extracted.
Tons.	Average Value Per Ton.		
16¾	$20.14	$2.63	86.94
19½	32.59	2.88	91.24
47	55.58	2.67	96.28
49	24.11	1.41	94.54
142¼	$35.19	$1.95	94.50

Condensation and Collection of Arsenic.

It was also asserted by some metallurgists that the roasting of arsenical pyrites presents many difficulties, but, after a pretty full experience with these Deloro ores, I can affirm, on the contrary, that they roast with much greater facility and in about two-thirds of the time necessary to roast simple sulphurets. They stand almost any amount of heat without fusing, and the arsenic, which forms 40 to 42 per cent of the mispickel, volatilizing at a comparatively low temperature, seems to leave the mass porous, thus facilitating the oxidation of the sulphur. The arsenic condenses readily in the series of brick chambers between the furnace and the stack.

The use of a centrifugal suction fan through which the furnace gases are drawn and the draft of the furnace thereby created, is also believed to be a novelty in metallurgy, which has here proved itself both practical and economical. It is clear that a blowing fan, which would occasion the escape of arsenical fumes, could not be used in this case.

Many important lessons have been acquired by experience at these works in regard to the construction of condensing chambers and the condensation of arsenic fumes, and I shall probably make them the subject of a special paper at some future meeting of the Institute.

Chlorination of the Roasted Concentrates.

The roasted concentrates are chlorinated by the Mears process, in charges of one ton, in a revolving lead-lined iron cylinder. The chlorine is made from chloride of lime and sulphuric acid, from 40 to 50 pounds of the former and 50 to 60 of the latter being used to a ton of ore. The pressure in the cylinder rises to about 40 to 50 pounds per square inch, and falls to 25 or 30 when the roast has not been so perfectly made as is desirable. The operation lasts about two hours, though probably much less time than this will be found sufficient to completely chlorinate the gold when it is in fine particles.

The completeness with which the gold is extracted is shown in the above table, which represents the whole amount of roasted ore chlorinated at the Deloro works, of which I have the headings and tailings assays. The ore and tailings were very carefully sampled, and every ton of tailings was assayed separately. Sometimes the samples from three tons of ore were united in one assay, but the tailings were as sayed ton by ton. The results were remarkably uniform, and after some experience had been gained, and especially after the second roasting cylinder was added, and the roast made more perfectly, the percentage extracted increased. This was also the case as the ore was concentrated more closely. The first 16¾ tons chlorinated were of partially hand-picked ore, crushed before the concentrating machinery was ready.

After making about twenty tons of concentrates, a closer work was made, and the concentrates frequently ran $70 to $85 per ton. In such cases the percentage of the gold extracted reached 98 per cent; and as the mean of 47 tons, containing on an average $55 58 per ton, the percentage extracted reached 96½ per cent. After that, the concentrating machinery having frozen up, unconcentrated ore had to be roasted; but, greater skill having been attained in the roasting, the chlorination extracted 94⅝ per cent. These results are considered as highly satisfactory both in roasting and chlorinating, especially when it is considered that they represent the first 142¼ tons roasted and chlorinated in the works, and that with almost exclusively unskilled labor.

Precipitation of the Gold.

The lime contained in the ore was found to give rise to quite unexpected difficulties in precipitating the gold from the chloride solution. The usual precipitant, ferrous sulphate, was found to throw down a voluminous precipitate of (principally) calcium sulphate along with the gold. In order to avoid this, we tried to get rid of the lime first by sulphuric acid. This was too tedious, and, after many annoying delays, the precipitation by charcoal was tried. The chloride liquor is allowed to filter slowly through a mass of charcoal, broken to say 1-16" to ¾" (1½ mm. to 12 mm.). The barrels are kept full of solution by the filtrate being brought from the bottom of one barrel in a rubber tube which terminates a few inches below the top of the next barrel. The precipitation of the gold is practically complete.

It may interest chemists to know that, though the lime does not remain in the charcoal, yet the liquor undergoes such a chemical change by its contact with the charcoal that the lime is no longer precipitated by either ferrous sulphate or sulphuric acid, but is by oxalate of ammonia.

Several chemists who have experimented with this Deloro chloride liquor, have considered that hydrogen sulphide, either in a saturated aqueous solution or as gas, or ferrous chloride, would make convenient precipitants, either of these reagents precipitating the whole of the gold without the lime. My own preference is for one of these rather than for charcoal.

The collection, drying and melting of the precipitated gold, is accomplished in the usual manner. The burning of the charcoal has not yet been done here; but in North Carolina, where the same process is in use, it is burned in an open iron pan with fire under, and it is claimed without loss of gold, and at a cost said to be less than six cents per ton.

Newspaper Mining.

While it does not become us to reflect upon the mining industries of other sections of our territory—and far be it from our intention to do so—nevertheless the absurdity of many of the newspaper reports that reach this office strikes us forcibly. Pima County, for instance, has had more mining on paper, more newspaper puffs and less returns from her mines, than any place we can imagine for the same period. Yavapai has had some very good mines, but those that have yielded the largest, like the Peck, Tiger, War Eagle, Tiptop and others, have either closed down or have become non-producers; and it is of newer property, and generally of lower grade, that now produces her present yield of bullion. The reports in the local papers, however, would lead a stranger to believe Prescott one of the most booming camps in the southwest. Maricopa papers fail to notice their only producer, the Vulture, but rush into praise of prospects that have never turned out a penny. These sections are not the exception, by any means, and the moral pointed is that newspaper puffing can not make a mine or a mining camp, and the utmost that the press can hope to do in this direction is to assist, unintentionally or otherwise, the manipulators of wildcat schemes to defraud outside investors. In an honestly managed mine, its output affords the only estimate of its value; and when it fails to produce, no amount of talking or writing can make it profitable. Take Cochise County out of Arizona's bullion and copper product, and the yield would not cut much of a figure among the list of mineral-producing states and territories; yet there is, perhaps, less said about these valuable properties in the course of a year by local papers than is accorded to some most worthless prospects in other parts of the territory. But this does not stop the stream of ore, the dropping of the stamps and the shipment of treasure, day in and day out the entire year through. Arizona is unquestionably a good mineral country, and if there were more work done on properties and prospects, and less on paper, Tombstone would not, perhaps, so deeply overshadow all other sections as a mining camp. *Benson Herald.*

THE IRON AGE.—The new iron mine discovered by Mr. P. F. Brown, of Los Angeles, has been named the Iron Age, and it is attracting much attention. While the business men of Los Angeles are negotiating to take advantage of this discovery, the people of Colton are hard at work to secure the business of the mine to their thriving place. It is reported that they have bonded the Cheney coal mine for $75,000, and have donated five acres of land adjoining both lines of railway, to a party of capitalists, on which to erect iron and steel works. Now what are the people of Los Angeles going to do to establish manufactures in this city? The ore from the Iron Age can be brought to Los Angeles as easily as it can be carried to Colton, and iron is in great and constant demand in this city for domestic use. A track can be laid from Alpine Station to the Iron Age mine in ten days, at small expense. But if our capitalists and land owners will not awake to the necessity of securing this business for Los Angeles, we shall be gratified to see our enterprising friends at Colton secure the prize. —*Los Angeles Herald.*

ANTHRACENE AND LIGHT.—According to *Engineering*, the substance known as anthraceue has been found by Dr. Tommasi to possess a new property, namely, a sensitiveness to light, which will doubtless prove of value. Anthracene, on exposure to light, acquires different physical and chemical properties, without any change in its composition. If a cold, clear saturated solution of authracene in benzol is exposed to the direct rays of the sun, it becomes turbid and deposits chrystals, which have received the name of paranthracene.

A California Cotton Mill.

We had a short paragraph recently upholding the benefits of home manufacturing, and expressing satisfaction that gratifying progress is continually being made in nearly all parts of the State. One of the most important movements, and interesting also because it is the pioneer establishment of its kind, is the projected cotton mill in Oakland, which is now being promoted by an incorporated company known as the California Cotton Mills Company. The objects of the company are to spin and weave cotton and to manufacture the usual articles made in cotton mills. The capital stock is $600,000. The board of directors is composed of the following: George W. Beaver, John Center, S. W. Rosenstock, L. Dinkelspiel, Captain J. C. Ainsworth, E. C. Sessions, V. D. Moody, A. Chabot and W. E. Miller.

We are informed that a tract of five acres of land has been secured in East Oakland, and that the company has also an acre upon the water front, thus insuring transportation facilities. The machinery will be ordered at once. The motive power and such other machinery as can be will be made here, but the looms and spinning machinery will be imported from Europe. As it will take several months for the machinery to arrive from Europe, work on the buildings will not be commenced immediately, but they will be ready for the machinery when it does arrive.

The company expects to obtain its supply of cotton primarily from Texas, which produces one-sixth of the cotton crop of the United States. There is cotton grown to some extent in this state. Messrs. Haggin and Tevis have between 200 and 300 acres in cotton on their property in Kern County, and Mrs. Strong, widow of Colonel Strong, the original cotton-raiser of the state, has grown 190 bales of cotton on her ranch, near Merced. The establishment of the cotton mills will attract more attention to the growing of cotton here, and this is quite practicable, for fine cotton has been produced in an experimental way in many different counties. There is also considerable cotton grown in Mexico, and quite a quantity comes here annually from Tahiti and the South Sea Islands, which can be made available. A man has been engaged by the company as its manager who has had twenty-one years experience at the business in Scotland, is a thorough mechanic and a practical man. About two hundred and fifty hands will be employed when the mills are in running order, and none but white labor will be employed, the major portion of which will be girls.

The Petroleum Boom.

The consant increase in the use of petroleum makes the business of petroleum mining, both for light and heavy oil, especially profitable. This is very encouraging to all persons eugaged in boring for oil in this vicinity. Seventeen years ago the price of oil was so low that it cost more for freight on a barrel of lubricating oil from the Ohio river to Boston and New York than the oil would sell for in those markets. As a consequence, the fine wells of lubricating iol were abandoned, and half the persons engaged in the production of that kind of oil were ruined. But steadily the introduction of this most valuable oil into the world's machinery as a lubricator has gone forward; and slowly but surely has it been introduced as fuel, till now in the oil region aloug the Ohio and the Little Kanawha, where oil of 28 gravity could not be sold for $1 a barrel in 1866, it now readily commands $20 a barrel, with a large demaud. This great advance is just what our oil men have needed, and they are going to work in right good earnest. A hundred wells will be sunk in Los Angeles and Ventura counties during the next twelve months, and there is a good demand for all the oil that they can produce, and the price will be rewarding. Our oil territory is a great bonanza, and Los Angeles is in the center of this favored portion of the Pacific Coast.

The Iron Age mine of magnetic iron ore has been sold to a company of heavy capitalists, and great steel works will be erected, and the manufacture of steel direct from the ore will be carried on in the course of a few weeks. This new and powerful corporation will be able to furnish a large demand for our petroleum, and we hope that the wells will be put down with all speed possible with safety, so that the fuel will be ready for these great works. People having oil territory should see that it is developed, and capitalists should assist with their means the industrious adventurers who are at work opening these rivers of oil, and who need plenty of money for the purchase of engines, tubes and tools.—*Los Angeles Herald.*

THE preliminary surveys for the Simplon Tunnel have been made by a commission of experts, who have pronounced against the route suggested, on account of the extreme heat likely to be encountered in the interior of the mountain —the normal temperature being estimated at nearly 98°—during the construction. In other respects the geological conditions are quite as favorable as those of St. Gothard. They propose, therefore, a line slightly different from the first proposed, which, though rather longer, would reduce the temperature to about 86°, and would afford better opportunities for ventilation.

The Engineer.

The Jordan Canal.

Doubts have been thrown on the practicability of the scheme for connectiug the Mediterranean with the Red Sea by way of the Jordan valley and Dead Sea. It is alleged that the engineering difficulties are greater than had been foreseen. The whole distance between the Dead Sea and the Red Sea is 108 miles, and though at either extremity there is for the first few miles an easy, gently rising sandflat, yet this soon gives place to rugged ascent. Beginning from the Gulf of Akabah, in the first thirty-five miles alluvial deposits and sand are passed over, but the ground gradually rises 600 feet above the level of the Red Sea. Even in the first fifteen miles the rise is 240 feet. The lowest point of the watershed is 780 feet above the level of the Red Sea, solid limestone and several bold porphyritic dykes intruding from Mount Hor eastward. To say nothing of the cutting from the Gulf of Akabah for thirty-five miles, where a slope has to be cut through which rises to 600 feet above the sea, there remains a mountain range of twenty-four miles to cross, varying from 170 feet to 780 feet in height, and after this a slope of six miles more till the sea-level is reached.

The writer leaves it to engineers to say how far the eight millions asked for will go towards this work. It is only just to the promoters of the canal, the Jordan Valley Canal Company, to mention that the whole of the facts about the heights of the different points in the Wady el Arabah referred to were known long ago to the promoters of the undertaking, and their estimates of the expense of the cutting have been framed to meet all the difficulties cited. Lieut. Vignes made his survey in 1864. Since then many things have happened. The present Suez Canal and Mount Cenis and St. Gothard tunnels were then thought to be impossible. Now they are not only made, but a tunnel under the English Channel has been projected, and M. de Lesseps is himself cutting a canal through the Isthmus of Panama, which, in consequence of the great depth of the cutting, and the mercurial condition of the river Chagres, renders it a far more difficult undertaking than the canal through the Jordan valley.

The Channel Tunnel.—The great bugbear with England in regard to the Channel Tunnel is the danger that it would open to invasion in case of war with France. As rediculous as the idea appears, engineers have proposed several ready ways to close the tunnel in such an event. The last proposition is from *Le Moniteur Industriel*, which urges the fortification, so to speak, of the Channel Tunnel by means of water, as a precaution to be adopted at both French and English ends, which might secure both nations from any fear of invasion. The system proposed is to consist of a small basin somewhat inland, with communications which can be opened and closed between the sea on one hand and the channel on the other, and also a steam engine and pump for pumping the water in and out. The admission of 176,000 gallons of water, it is estimated, would render the tunnel impassable without destroying the apparatus for illumination, telegraphing, etc., which it would contain, and which could be extracted when the danger was over without excessive expenditure of time and money.

Heavier Rails and Fewer Ties.—The heaviest rails used in this country do not exceed seventy-two pounds per yard, the average being sixty pounds per yard, or ninety-four tons per mile, while the best English roads use a double-headed rail weighing eighty pounds per yard. Allowing an average face to face cross-ties of nine inches, and 3,000 ties per mile, we have a wood-bearing surface of 2,250 lineal feet per mile of track. The English roads, with a heavier rail, have a much less number of cross-ties. A rail weighing eighty pounds per yard equals 125.7 tons per mile, and with cross-ties of nine inches face (average), and ten to each rail length, the English track has a wood-bearing surface of 1,432 lineal feet, about thirty-two per cent less than our own roads. That is what we shall eventually come to in America—a heavier rail and less wood on our road-beds. We think that it is not safe to use soft wood ties, such as white cedar or hackberry, save upon tangents, and then oak ties should be used at the rail joints, with only the best oak ties upon curves.—*Iron Age.*

The Proposed Saharan Sea.—Speaking of the proposed Saharan Sea, Dr. Bodichon, of Algiers, in a pamphlet just published, deprecates the formation of a vast inland salt water lake "till we find out to a certainty whether the salt water thus introduced may not penetrate to the fresh water sources underground, and deprive us of the means of obtaining artesian wells," etc. The writer also makes many curious observations concerning what, in his opinion, is the great taste for practical science in the nineteenth century, namely, the civilization of the Sahara and necessary changes of climate by artificial means.

Useful Information.

Original Discovery of Iron and Steel

In his address on technical training, delivered a short time since before the Alumni Association of Lehigh University, Dr. Thos. M. Drown, of Easton, Pa., pictures the discovery of metallic iron and steel as follows: "Nearly all the early discoveries in the arts were the result of accident or haphazard experiment. We can well imagine that a fire large and intense enough to reduce iron from its ore must often have been made in accidental contact with surface ore, and that the presence of the metal in the ashes must have attracted attention. This observation once made, there would follow a series of experiments to determine the conditions under which the metal was produced, and the substances necessary for its production. It would not long escape intelligent observation that a certain brown earth, or may be a black rock, was the substance which yielded the metal, and that fire was the necessary condition of its formation. But the iron thus accidentally produced—a mixture of metal, cinders and ashes—was of no value till further experiment revealed the fact that the metal could, when hot, be united by hammering into one mass, with the separation of cinder and other extraneous matter. The discovery of this property prompted still further experiment. The irregularity of the product would suggest the more perfect control of the fire, and small furnaces would be built. In the course of time it would be noted that the iron was not uniform in hardness, and an accident would be sure to reveal the fact that sometimes the metal, when suddenly cooled in water, would become intensely hard. This new line of investigation would result in the production of steel."

How Animals Have Foretold Earthquakes.

An Italian writer on the dreadful catastrophe which occurred so recently on the Island of Ischia, mentions those prognostications of an earthquake which are derived from animals. They were observed in every place where the shocks were such as to be generally perceptible. Some minutes before they were felt the oxen and cows began to bellow, the sheep and goats bleated, and rushing in confusion one on the other, tried to break the wicker-work of the folds. The dogs howled, the geese and fowls were alarmed and made much noise; the horses which were fastened in the stalls were greatly agitated, leaped up and down and tried to break the halters with which they were attached to the mangers; those on the road stopped suddenly and snorted in a very strange way. The cats were very much frightened, and tried to conceal themselves, or their hair bristled up wildly. Rabbits and moles were seen to leave their holes; birds rose as if scared from the places on which they had alighted; and fish left the bottom of the sea and approached the shores, where at some places great numbers of them were taken. Even ants and reptiles abandoned, in clear daylight, their subterranean holes in great disorder, many hours before the shocks were felt. The dogs, a few minutes before the first shock took place, awoke their sleeping masters by barking and pulling them, as if they wished to warn them of the impending danger; and several persons were thus enabled to save themselves.

Brazing Band Saws.—The Hoyt & Bro. Manufacturing Co., of Aurora, Ill., gives the following directions for performing this operation: File the ends of the band on opposite sides, to form two wedged shaped ends, having a lap of say ¾ inch long, which, when laid with their beveled and filed sides together, shall form a good joint of the same thickness as blade. Now clamp the ends on a piece of board, with the back of the blade towards you, with the lap brought fair together. Cut a piece of silver solder large enough to cover the lap, lay it between the lapped portion, with a little pulverized borax. Now, having a piece cut out of your board, say three inches wide, directly under your lap, heat your soldering tongs to a bright cherry red, and hold them pinched firmly on the lap until the solder flows freely from under the joint, then cool off the tongs and soldered portion of saw by pouring water upon the same, without relieving the pressure, until nearly cold. Try a file on both sides the blade, and should it be harder than the other part of the blade, reheat your tongs a little, and draw the temper by pressing the tongs upon the hard portion of the blade till partially heated, but not upon the lap, as it will weaken your joint. File off the solder, and joint to the same thickness as other parts, and the soldering of your band is completed.

Education in the Work Shop.—One of the New England manufacturing companies has introduced an educational qualification into its works, and is said to be discharging all employes who can not read and write. Before doing so, an opportunity was offered to all to qualify themselves, a night-school being established for that purpose. While this is an unusual proceeding, there is some good sense in it. Illiterate labor is, as a rule, the very poorest kind. While the mill operative may have no need while actually at work to either read or write, he will almost surely be a better and brighter workman at purely mechanical operations if he can and does read instructive publications and write in his leisure hours. The fact is recognized by the state that education is desirable, and the New England manufacturing companies simply apply to their own communities what everybody says is good for the population en masse.—*Philadelphia Ledger.*

How to Test Kerosene Oil.—It is a simple matter to test kerosene oil. The point of danger is called the flashing point, which is the degree of temperature at which it is evaporized and explodes. The lowest safe point is 100 degrees; 120 degrees is low enough for domestic use. To make the test, pour a small quantity of kerosene in a small saucer or tin vessel, and float it in a basin of water heated to 100 degrees. Apply a lighted match an inch or so above the oil, and if it takes fire it is dangerous. Have a thermometer in the water, and note the temperature as it falls, and the lowest point of flashing is easily ascertained; or the water may be gradually heated by adding boiling water from eighty degrees up, and the flashing point found.

A New Telegraph Soldering Iron.—A very convenient soldering iron for the use of linemen in erecting and repairing telegraph or telephone lines has been devised by Mr. J. O. Fry, of the National Telephone Company, Nottingham, England. The bit is hollowed out into a well for receiving a pool of liquid solder, a groove being formed to carry off excess into a chamber within the handle. The joint to be soldered is laid in this well. The iron is so constructed that new bits can readily replace the old, while the flat side of the iron is used in the ordinary way. By its means eight or more joints can be soldered at one time.

Borax is one of the best roach exterminators. It should be pulverized and sprinkled around the infested places.

Good Health.

What Paralysis Is.

Interesting and Profitable Medical Reading for Non-Medical People.

So common has the occurance of paralysis become in recent years, that non-medical people have a desire to know more about it. Many think that paralysis is a disease of itself. That some medical men so regard this condition is plain from the fact that deaths are frequently certified to have been caused by it. The incorrectness of this notion will, however, be plain when the conditions which give rise to paralysis are clearly set forth, and this we now propose.

A carpenter, blacksmith, or some mechanic whose business requires him to wield a hammer, finds some morning that he is unable to raise his hammer arm, or perhaps while at work the man suddenly feels his arm become numb and weak, it falls to his side, and he is no longer able to work. The doctor to whom the man applies says a "brachial monoplegia from muscle tire," which means simply that the man has overwrought his hammer arm and it needs rest. To these cases the very appropriate name of "artisans' palsy" is given. Again, a poor-blooded, nervously constructed person, most likely a woman, meets with a great shock or has to endure an unusual and prolonged mental or physicial effort. Soon, and perhaps without warning, the individual loses the use of some part of the body, often of the vocal apparatus, and the patient is unable to speak above a whisper. The doctor says "hysterical paralysis," or "hysterical aphonia," loss of voice. Now just how this comes about we fancy it would puzzle the most learned doctor to say. Concerning this condition, however, as well as the one before mentioned, this much is known, viz., that by appropriate treatment they recover perfectly and promptly, very good evidence that no part of the nervous apparatus is broken. The faith cures reported from time to time are probably cases of the kind last mentioned.

It sometimes happens that an intoxicated person will fall asleep with the head resting upon the arm or with the arm hanging over a chair back. When the person wakes the arm is numb; it tingles and is paralyzed—another "brachial monoplegia"—but really pressure upon the trunks of the nerves which supply the disabled member has affected those nerves so that they are unable to perform their usual duty. The nerves which go out from the brain and spinal chord to the extremities are quite comparable to the wires which are streched from place to place for electric communication, and pressure upon one section of those nerves produces results very like those which follow an interference with the wire. The case just given illustrates very well a large number of cases of palsy from pressure, for pressure upon the brain or spinal cord, or the nerves which have their exit therefrom, will produce a palsy whose extent will depend upon the extent of the pressure, and whose durability will depend upon the chances for removing the pressure. Pressure upon the nerves which supply one side of the face produces a very characteristic paralysis, and one that causes many laughable mistakes on the part of tyros and non-professional people by their attempts to detect the affected side. Pressure upon the brain or spinal cord is mostly due to the presence of tumors, to fractures of the skull, or bones of which the backbone is formed, and to blood clots within the skull or spinal canal. Patients who recover from diphtheria, scarlet fever, and some other acute sickness, are frequently paralyzed in some part. These cases generally recover by appropriate treatment, and it is quite probable that many cases would recover spontaneously. The remarks before made concerning certain cases which recover will apply equally to the cases just named.

People who work in lead are liable to a peculiar form of paralysis, which is first seen, as a rule, in the muscles of the forearm, on account of which the patient is unable to extend the hand upon the arm. At times the whole muscular system is involved. Change of occupation and the use of remedies which will assist the elimination of the mineral from the system is the proper course for such patients. Analogous forms of paralysis are caused by arsenic and mercury, probably by their action upon the nerve structure of the spinal cord. Woorara, the Indian arrow-poison, will also produce paralysis if introduced into the system in sufficient quantities. The paralyzing effect of large doses of alcohol are well known. Certain conditions of the circulatory apparatus predispose to extensive and often incurable paralysis. The arterics are elastic tubes. By age, hard work, care and the prolonged use of alcoholic drinks, these tubes lose their elasticity and become brittle. By some event which determines an unusual quantity of blood to the brain one of these now inelastic tubes is broken, the poured-out blood clots, as before mentioned, and a paralysis immediately follows.

Owing to certain systematic conditions, fibrin, a substance normally suspended in the blood, lodges upon the flood-gates—valves—of the heart. Presently a part of this matter is dislodged and washed away into the blood; perchance it reaches an artery in the brain which will not permit it to pass. This at once cuts off the blood supply from a part of the brain, one of the immediate symptoms of which is palsy of the part of the body which receives its nervous supply from that portion of the brain. These paralyses are usually extensive, and are not readily distinguishable from those just mentioned.

The presence of worms in the bowels of children is believed to produce paralysis in some cases. Such cases, being due to a known removable cause, are described as reflex paralyses. These are not seen alone in children, but in adults as well. Finally, changes in the structure of the brain or spinal cord produce paralysis, varying in extent with the extent of nerve structure involved. Such paralyses are especially obstinate in those of advanced years. Change of structure in the spinal cord usually produces disability in the legs. Now, these are the most common causes of paralysis, and from what has been said, it will be observed that paralysis is not a disease of itself. Neither is it always incurable.

Labor and Food.

The human body never ceases to work. Even in the most profound slumber some of the functions of life are going on, as, for instance, breathing, the circulation of the blood, digestion, when there is food in the stomach; and it follows that some part of the nervous system is therefore awake and attending to business all the day and night long. In the act of living, some of the substance of the body is being constantly consumed. The amount of work done by the heart in one day in propelling the blood is now estimated as equal to the work of a steam engine in raising 125 tons one foot high or one ton 125 feet high. We lose in weight by working. Weigh a man after several hours' hard labor, and he will be found two or three, and, in extreme cases, several pounds lighter. If we do not wish to become bankrupt, we must replace by food the amount we have lost by labor. Hunger and thirst are the instincts which prompt us to do this. They are like automatic alarm clocks, which stop the engine at various points to take on fuel and water. In a healtby man as much is taken in as is required to maintain the weight of the body against loss. Nature keeps the account. On one side is so much food spent in work; on the other, so much received into the stomach for digestion. They should balance like the accounts of an honest bookkeeper. In an unhealthy person the instinct of hunger becomes disordered and does not sound the alarm, and so the person goes on working without eating until he becomes pauperized; or the instinct works too frequently, and he eats too much and clogs the vital machinery. A calculation of the business done in the body reveals the fact that for a hard-working person about 8½ pounds of food and drink are used up daily; some bodies use more and some less, but this is the average. The profit which the body gets on this transaction has been calculated, and may interest our readers. The energy stored up in the 8½ pounds of food ought to raise 3,400 tons one foot high. Most of this energy, however, is expended in keeping the body warm and its functions active. About one-tenth can be spent in our bodily movements or in work. The profit, then, on the process is about ten per cent. This is enough to raise 340 tons one foot high each day—a profit which is quite enough for earning a good living if rightly expended, and it is probably more than most make; but all ought to strive to reach this point if possible.

TABLE OF CONTENTS.

EDITORIALS.—Copper Smelting Plant; Mules Underground; Development Companies, 241. Passing Events; The English Predilection for Incorporating Companies; The Day of Small and Better Things; Classes of Titles to Mines, 248. The Foss Rolling Shutter; New Ore Concentrator; Roasting Silver Ore Containing Gold, 249. Blasting in Mines, 252.

ILLUSTRATIONS.—Copper Smelting Plant, 241. The Foss Rolling Shutter in Place; Details of Construction of the Foss Rolling Shutter, 249.

MECHANICAL PROGRESS.—The Cost of Wrought-Iron Framing; Transmission of Power; Compound Locomotives; A Wooden Boiler; Long or Short Rails; Wear of Iron Work; Penning's Steam Joint, 243.

SCIENTIFIC PROGRESS.—Ancient Glaciation of North America; The Comet; Measurements of the Depth of Sleep; Photographing Reichenbach's Flames; Primeval Timber; Micro-organisms in Water; Tester's Telephone, 243.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends and Bullion Shipments, 244.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Idaho, Montana, New Mexico, Oregon and Utah, 244-45

THE ENGINEER.—The Jordan Canal; The Channel Tunnel; Heavier Rails and Fewer Ties; The Proposed Saharan Sea, 247.

USEFUL INFORMATION.—Original Discovery of Iron and Steel; How Animals Have Foretold Earthquakes; Brazing Band Saws; Education in the Work Shop; How to Test Kerosene Oil; A New Telegraph Soldering Iron, 247.

GOOD HEALTH.—What Paralysis Is; Labor and Food, 247.

MISCELLANEOUS.—Great Salt Lake; Money for the Mines; The Oil Interest of Southern California; Wyoming Oil, 242. Working Gold-Bearing Arsenical Ores; Newspaper Mining; A California Cotton Mill; The Petroleum Boom, 246.

NEWS IN BRIEF—On page 252 and other pages.

Passing Events.

There is no news of any special moment from the mining regions other than we give in our "mining summary." It is near the close of the season on the more mountainous regions. In Montana and Idaho the cold weather will soon set in, and many mines will he closed down. The larger and better equipped mines, however, will continue to work. In this state, New Mexico, Arizona, and most parts of Nevada, work can go on all winter. But prospectors will soon he going into winter quarters, and leave the mountainous regions. So far in these latitudes pleasant weather continues. There are rumors of some new mining fields in Arizona, but nothing definite is known as yet.

MECHANICAL POWER.—By this term is meant any pressure acting tbrough a certain space with a certain velocity which can be converted into a greater pressure with a less velocity through a smaller space, the quantity of mechanical force or power remaining unchanged; and all that the above so-called mechanical powers are used for is to effect this transformation. They do not and can not create power or force, because that is eternal, and can neither he created nor destroyed. It requires just the same amount of force to lift one pound through 100 feet as it does to lift 100 pounds through one foot in the same time.

GERMANY is making warlike preparations all along the Russian frontier. Men are working day and night on the lines of defense, and a number of ironclad turret-ships are being constructed.

ALL implicated in the recent rebellion in Egypt have been granted amnesty, except those convicted of murder and outrage.

The English Predilection for Incorporating Companies.

In contemplating the many companies formed in this country for the prosecution of mining and other enterprises, one not well acquainted with the facts might he led to conclude that we surpassed all other peoples in the multiplicity of these schemes, designed to promote our industrial interests. As compared with the English, however, we may he said to do very little in this direction, there being perhaps a score of these associations in the city of London to one in even the largest city in the United States. In the average Briton the commercial instinct meets with ahnormal development, a proclivity that is fostered hy the vast accumulations of capital in the British metropolis. Much of this capital is idle, and ever seeking profitable investment. Hence the readiness witb which money is embarked in any projected scheme that promises large or even moderate returns.

In so far as the manufacture of the more staple commodities is concerned, this branch of business is apt to he engaged in hy individuals or small unincorporated companies, who carry it on in a careful aud systematic manner, some one, or more likely all the memhers of the firm, giving to it their personal attention. But when it comes to mining, the manufacture of some new-fangled machine, or the vending of some article, useful or otherwise, as a patent mouse-trap, a peanut roaster, a clothes-wringer, or a quack medicine—a stock company is forthwith organized, and the investing public invited to buy sbares at the " up-shot," or, as we term it, "bedrock" price. Astonishing, and to the American mind incredible, are the number and nature of the objects for the promotion of which these joint-stock companies are incorporated. Recourse is had to them as a means of furuishing the public with electric light, gas and water, for disposing of nightsoils and the city sewage, for the manufacture of patent medicines and patent manures, for supplying bihles to the converted, and hrass idols to the unregenerate heathen. If at any time there arise a scarcity of Japanese curios or Chinese crackleware these Londoners proceed at once to form a company for makiug such class of goods, and so, if the market hecomes bare of any other article of utility or virtu.

As to the mining enterprises of these Englishmen, they extend to all parts of tbe civilized world, and even to some parts that are not much civilized. They have home companies and foreign companies organized to operate not only in England, Wales, Ireland and Scotland, but also in India, Africa, aud Australia, South and Central America, Mexico, and the United States. They not only mine in all countries, but for all kinds of metals and minerals—for coal, copper, lead, iron, and tin athome, and for every thing that possesses economic or commercial value ahroad. It matters little tbat they meet with only disappointment, as in India; not until it has been thoroughly tested do they withdraw from the field. He is naturally bopeful and plucky, is John Bull, and rarely abandons an undertaking until he has made an energetic and persistent effort at success. Hence the much money and the many years sometimes spent in these frnitless enterprises.

Though they oftener fail, these Britons are apt to do more to entitle them to success in their mining undertakings than the Americans. In the first place these English companies conduct their affairs usually with more precision and system than is done in this country. Besides an annual report made by the President of the company to the shareholders, the Superintendent of the mine is required to prepare and forward to the home office a weekly statement of expenditures made, progress of work, ore extracted, hulliou turned out, the condition and prospects of the mine, etc. From these weekly statements the President of the company, or Chairmau, as he is there called, makes up his annual report, adding such further information as he may be possessed of that would be of interest to the shareholders, most of whom make it a point to attend these annual meetings. It is the habit of English shareholders to not only attend these regular meetings, but to interest themselves earnestly and actively in every thing pertaining to tbe affairs of the company, asking questions of the Chairman when they desire further information, and criticising his report if they think it open to objection or censure. These meetings are sometimes the scenes of very animated discussions, either hetween the Chairman and memhers or members themselves. This watchfulness of officials, though quite unlike the American metbod, is much to he commended, as tending to secure on the part of officers and employees greater economy and care in the discharge of their duties.

The Day of Small and Better Things.

If reports emanating from the newspaper press in the mineral regions may he credited, mining is in a prosperous condition throughout most parts of California. Making due allowance for the over-sanguine views of the local journalist, this industry would seem to be in a tolerably healthful if not exceedingly flourishing condition. That the mass of those engaged in this business are doing moderately well there is good reason to believe, advices through our own correspondence and other reliable sources of information tending to confirm this view. While the shortness of the water season has served to curtail somewhat the product of hydraulic mines, this has worked to the advantage of those engaged in river-bed operations, the most of which are making out extremely well. This branch of mining is engaged in extensively on Scott River for five or six miles ahove its junction with the Klamath, also along the latter stream for a considerahle distance both ahove and helow the mouth of Scott River. In this vicinity river-bed miniug has heen carried on for twenty years or more, latterly on a very extensive scale, and always with good, though, as is everywhere the case with this branch of mining, with varying success. Along the Salmon, Trinity, and other of these northern rivers, this business is pursued in a smaller way, heing largely in the hands of the Chinese, who practice chiefly by the method of wing-damming. As they select the sites of these operations with care, prospecting them thoroughly the preceding year, these people generally make good wages in so reclaiming and working sections of the river beds. Should the water remain at its present low stage for a month longer, a great deal of gold will this season be taken from the heds of these northern streams.

In quartz mining, the condition is more than merely healthful; this interest is prospering beyond what it has ever done before. Besides good progress made generally over the state, mines in new localities are being successfully opened up, as in the Calico district, San Bernardino County; Deadwood, Trinity County; and elsewhere. So, too, more work is heing done and hetter results are being reached in the older districts, where the business, owing to various causes, had suffered a relapse, work for years having heen suspended in many of the mines or heen pushed only in a feeble way, some claims having been entirely ahandoned. All through Plumas, Sierra, Nevada, and El Dorado counties we have examples of this kind. In Amador, Calaveras, and in counties further south, instances of resuscitated mines, and even of entire districts, are to he met with. It is noteworthy that this improved condition of the quartz interest is without that excitement and over-confidence that in earlier times led to premature and reckless expenditure , and often to ruinous speculation. The business is now carried on quietly and temperately, work being planned with judgment and money expended with economy and care. Men do not talk so extravagantly now as aforetime, nor do they get excited over a big clean-up, nor go crazy at the sight of a rich piece of quartz. The day of hig expectations and big things has happily departed, and the day of small and better things come in its place; and this is fortunate for all—fortunate for the capitalist, because there comes with it reduced expenditure and greater security; and fortunate for the laborer and miner, because they are forced to the adoption of more steady and healthful habits, whereby they loose less time and save more money in the end. "Easy come, easy go" is a saying the truth of which has found sad confirmation in the lives of California miners, a class that will probably lay up more money now, with the changed condition of things, with wages at only two dollars per day, than they did when the wages they received were two or three times as much.

The removal and reworking of the tailings that have accumulated in the mountain gulches and along some of the river-beds lower down constitute a class of operations to which not much attention has heen given till lately. Work is now in progress, or has been completed, at several places on opeu cuts for running off and washing these deposits, which ar known to contain a great deal of gold, which, by reason of the fineness of the particles or of tbeir heing imhedded in hard cement, escaped from the miners' sluices at a first washing of the gravel. The retention of these deposits in the places where we now find them is due generally to the presence of rocky ledges running across these gulches, and which have prevented the escape of auy but the finer sand and silt or matter held in solution in the water. Most of the gold, including all mixed with the cements and conglomerates, is supposed to have remained behind with the coarser gravel and other heavy material. Though known to be rich in gold, the considerable cost of running these open cuts through the hard hedrock has deterred parties from undertaking their construction until recntly. That they will answer the purpose intended, and pay largely in the end, is pretty well estahlished by the success that has attended one or two works of this kind already completed aud in operation.

Classes of Titles to Mines.

Three distinct classes of titles are created by the mining laws of the United States. These have been defined hy the Secretary of the Interior; as, 1. Title in fee-simple; 2. Title by possession; 3. The complete equitable title.

The first vests in the grantee of the government an indefeasible title, while the second vests a title in the nature of an casement only. The first, being an ahsolute grant by purchase, and patent without condition, is not defeasible; while the second, being a mere right of possession and enjoyment of profits, without purchase, and upon condition, may be defeated at any time by the failure of the party in possession to comply with the condition; viz., to perform the labor or make the annual improvements required by the statute. The equitable title accrues immediately upon purchase, for the entry entitles the purchaser to a patent, and the right to a patent once vested is equivalent to a patent issued.

Section 2,324 of the Revised Statutes, which defines the sizes of claims locatahle, and provides for forfeiture on failure to comply with the conditions, has reference solely to titles hy right of possession, aud does not in any way conflict with titles acquired by purchase, for in the latter case both must be in one and the same person. A title by right of possession is the lowest grade of title known to the mining laws; the next is the equitable title, wbich accrues upon purchase and entry; while the third and final grade is the fee-simple, which is acquired by pateut evidencing the legal title and merging this in both the possessory and equitable titles.

Where lands are acquired under the pre-emption laws, it sometimes occurs that the legal title may be in one person and a superior equity in an another; but this can not occur under the operation of the mining laws, for all legal and equitahle adverse titles and claims must he presented to and passed upon by the courts prior to the issuance of patent, or be considered as stale or abandoned. This question was expressly decided upon by Judge Field in the case of the Eureka Mining Company against the Richmond Miniug Company.

The First Locomotive.

EDITORS PRESS:—Is not the PRESS in error, stating, in its issue of October 6th, that "the disastrous fire at Pittsburg destroyed the Exhibition Building with its valuable conteuts, including the first locomotive ever run in the United States?"

The first locomotive run in the United States was tbe "Lion," manufactured in Strowhridge, England, and known as the "Strowbridge Lion," the head of the hoiler being ornamented with the representation of a lion's head.

It was taken on canal-hoats from New York to Kingston, on Esopus Creek, and from tbence hauled to the Honesdale and Carbondale railroad, where it made the first trip ever made by a locomotive in the United States, the engineer being Horatio Alleu, who, I believe, is still living in the enjoyment of a hale and hearty old age.

The "Lion" was found to be too heavy for the track, and was shortly replaced by others, constructed under Mr. Allen's supervision, at the West Point Foundry.

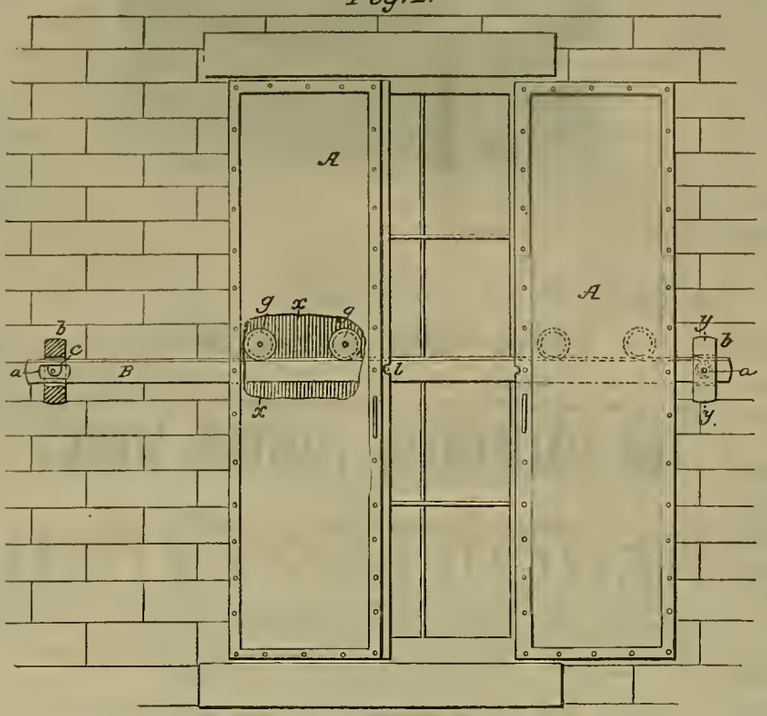
The boiler of the old "Lion" was in use several years in a machine shop at Carbondale, but the other portions of the engine were destroyed.

The power of the "Lion" was communicated to the wheels hy means of two walking-beams.

THEODORE L. CHASE,

Turkey Creek District, A. T.

The Foss Rolling Shutter.



The engravings on this page illustrate an improved iron shutter that can be readily opened from the outside, and at the same time easily opened from the inside. The shutters are of ordinary construction, made of two thicknesses of sheet iron, with a space between them that may be filled with a non-conductor of heat, if desired. The shutters *A* rest upon a cross-bar or track *B*, preferably of steel, attached at its ends to the wall of the building in a peculiar manner. There are slotted castings *b* in which the track rails rest, the slotted bar, or track, entering loosely through these castings. On the bolt *b* and within the slot of the bar are eccentries *c*, by which the bar, or track, is clamped to the casting. This is shown in Figs. 1 and 4. This construction allows the bar to expand from heat without springing, which might prevent the free working of the shutter. The other end of the bar *y y* has the eccentric but not the slot.

The object of the eccentrics is to allow adjustment of the shutter if the walls settle, or the shutter works too closely to the window-sill. The ends of the bolts are square, to receive a wrench for the adjustment of the eccentrics. A nut on the other end olt of the bholds the eccentric in position, as well as the casting and shutter to the building.

The track *B* passes between the two sides of each shutter and through an iron box or casting that is fitted within the shutter, as shown at *x*, in Fig. 1. This casting that contains the grooved roller or sheave *g* is held in place by cross-bolts, as shown in Fig. 2. The sheaves *g* roll on the bar *B*. Fig. 2 is a section of the door with the casting and sheave. Fig. 3 is a section of the house wall, showing method of securing the slotted castings and eccentric by the square-headed bolt. The shutters are made with their inner edge rabbled to lap one over the other, and the supporting bar is provided with a center pin to prevent each shutter from passing beyond the center. Handles inside and out are provided for moving the shutters.

Iron shutters as usually made are good to protect buildings against fires in adjoining houses, but when the building on which they are is on fire, they prevent access to it by the firemen. So firemen think iron shutters have caused more loss than they have prevented. With these shutters of Mr. Foss, however, this objection is overcome, because they can be opened from the inside or out. They can be made to work inside the walls of a building, and be as effectual in case of fire as if on the outside; or it can work in spaces in the walls if desired. The shutters may be opened from the inside with ease and safety in high winds, and may be left more or less open as required. They will not slam or blow loose in storms. These rolling shutters cost but little if any more than the old-fashioned swinging ones, and may be applied to an old or new building equally well. N. A. Foss, of Clendenin, Meagher County, Montana, is the inventor of this device, and offers it for sale to manufacturers either by state right or royalty. Any farther information which may be desired may be obtained by addressing the inventor.

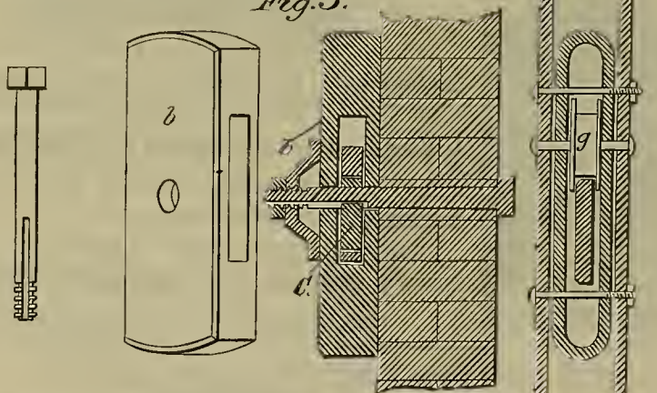
Fig. 3.



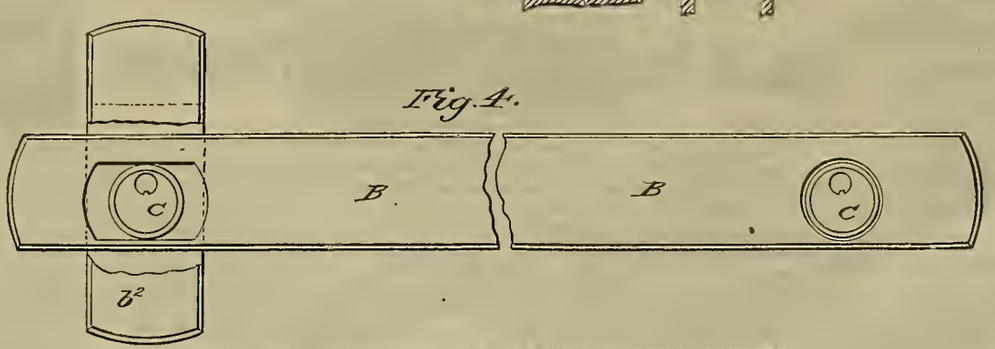


Fig. 4.

DETAILS OF CONSTRUCTION OF THE FOSS ROLLING SHUTTER.

Dr. Koch, of the German Commission which went to Egypt to investigate the cholera epidemic, reports that he discovered that the cholera is due to a living thread-like microscopic organism, resembling that seen in cases of phthisis.

New Ore Concentrator.

William E. Stirk, of Leadville, Col., has just received through the Mining and Scientific Press Patent Agency, a patent for an ore concentrator having a combined rotary and oscillating movement. The combination of devices form an improvement on the concentrator patented by J. S. Duncan in 1882. The pan or concentrator is placed on a central hollow discharge-shaft, or post, which is fixed to the foundation timbers. A sleeve surrounds the upper part of the hollow shaft. In the center of the pan is a flat disk surrounding the top opening of the hollow shaft, and forms by its thickness a slight dam to arrest the lower stratum of sand as it flows towards the central opening of the hollow shaft. The pan, as it will be seen, discharges from the center.

The outer portion of the pan is made of stout sheet-iron riveted to the flat disk or flange described. The improvement consists in providing thin metal rings of such a size as to fit snugly around the central disk or flange, and project above it. Several of these rings of different depths may be fitted to this flange, so that any depth of sand may be maintained. These flanges work inside of each other like the joints of a telescope, or a pocket cup, so as to be raised or lowered to regulate the height to suit the work to be done. The bottom of the pan slopes downward to the periphery, where it curves upward, to form the sides, and a channel is formed around the outer edge of the pan, within its periphery, into which the sulphurets are caused to settle by the peculiar oscillating rotary motion of the pan. Suitable gearing causes the pan to rotate, and it is also given a secondary shaking motion while revolving around the main central shaft.

A Sacramento man, by the aid of a steamboat, promises to supply the residents along the Sacramento river with groceries.

Roasting Silver Ore Containing Gold.

For chloridizing roasting of silver ores containing gold without subsequent treatment by chlorine gas, the ore containing the silver and gold is roasted with salt, converting thereby the silver into a chloride, while the gold remains in a metallic condition. This mode of roasting is quite satisfactory for the subsequent amalgamation in pans. But if these metals are intended to be extracted by a solving process where no amalgamation takes place, the gold must also be converted into a chloride while roasting. In roasting ores in which gold and silver are present, with salt, chloride of gold is formed, according to Plattner; but before the ore becomes red-hot the gold loses a part of its chlorine—is reduced to a sub-chloride, and at a little higher degree of heat to metallic gold.

Mr. Kustel says, in his "Roasting of Ores," that to form chloride of gold by way of roasting, a better result is obtained in the furnace if the ore is roasted first without salt till the smell of sulphur is no longer perceptible; and then, after it has cooled down to a low temperature, the salt is added, and the whole stirred for some time. A suitable form for the furnace would be a small hearth or furnace, altered in such a way that the second hearth should be ten or twelve inches below the first. The arch of the first hearth, however, should continue in a straight line. By this means the space is widened and the temperature brought down to the proper degree.

The ore is charged in the first hearth near the bridge, and roasted in the usual way, oxidizing the sulphurets. When this is effected, the ore is shifted over in the lower furnace, and the upper charged again. As soon as the roasted ore assumes a dark-red heat, the salt is introduced and baked for two or three hours. According to Roeszner, a combination of gold oxide and chloride of sodium ($Au^2 O^3 Na Cl$) is formed.

It is not soluble in water, and but slightly in salt solution, and can not be amalgamated; but it is soluble in hyposulphite of soda or lime. V. Lille and others consider the gold in the state of a sub-chloride. Hot water can not be used for the purpsoe of leaching out base metals, as the chloride of gold would be decomposed.

Some Uses of Charcoal. Charcoal, laid flat, while cold, on a burn, causes the pain to abate immediately; by leaving it on for an hour, the wound seems almost healed, when the wound is superficial. Tainted meat surrounded with it is sweetened. Foul water is purified by it. It is a great disinfectant, and sweetens offensive air if placed in shallow pans around apartments. It is so very porous that it absorbs and condenses gases rapidly. One cubic inch of fresh charcoal will absorb nearly one hundred inches of gaseous ammonia. Charcoal forms an excellent poultice for malignant wounds and sores. In cases of what is called proud-flesh it is invaluable. It gives no disagreeable odor, corrodes no metal, hurts no texture, injures no color, is a simple and safe sweetener and disiufectant. A teaspoonful of charcoal in half a glass of water often relieves a sick headache. It also relieves constipation, pain or heartburn.

At a meeting of the Central Labor Union at New York, a recommendation was received from an advanced labor club, urging that all workmen form themselves into military organizations, to enable them to defend their rights.

Metallurgy and Ores.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

ESTABLISHED, 1869. C. A. LUCKHARDT, Manager.

Ores worked by any Process.
Ores Sampled.
Assaying in all its Branches.
Analyses of Ores, Minerals, Waters, Etc.
Working Tests (Practical) Made.
Plans and Specifications furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines, plans and reports furnished.

C. A. LUCKHARDT & CO.,
(Formerly Huhn & Luckhardt.)
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.

IMPORTERS OF AND DEALERS IN

Assayers' Materials,

MINE and MILL SUPPLIES,

CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

118 and 120 Market Street, and 15 and 17 California St., San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods both as to quality and price. Our *New Illustrated Catalogue*, with prices, will be sent on application.

☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

THE CONSUMERS' COMPANY.

VULCAN B B,

Black Glazed Powder,

In kegs and cases. The Best Low Grade Explosive in the market. Contains no Nitro Glycerine. Superior to Judson or any Black Powder made.

Is Unequaled for Bank Blasting & Railroad Work.

VULCAN NOS. 1, 2 AND 3,

The Strongest, Most Uniform and best Nitro Glycerine Powder manufactured, as which we are prepared to furnish at very lowest prices.

Caps and Fuse of all Grades at Bottom Rates.

Patent Agency.

(ESTABLISHED 1860.)

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

CHICAGO **FRASER & CHALMERS.** ILLINOIS

MANUFACTURERS OF IMPROVED AND APPROVED RMS OF

MILL AND MINE MACHINERY.

Having made extensive additions to our Shops and Machinery, we have now the LAROEST and BEST APPOINTED SHOPS in the West. We are prepared to build from the Latest and Most Approved Patterns,

QUARTZ MILLS

For working gold and silver ores by wet or dry crushing. The Stetefeldt, Howell's Improved White, Brunton's & Bruckner Furnaces, for working base ores. Rotary Dryers, Stetefeldt Improved Dry Kiln Furnaces.

SMELTING FURNACES,

Water Jackets, either Wrought or cast iron, made in sections or one piece, either round, oblong, oval or square. Our patterns most extensive in use. SPECIAL FURNACES FOR COPPER SMELTING. Slag Pots and Cars, improved form. Bullion and Copper Moulds and Ladles, Litharge Cars and Pots, Cupel Furnaces and Cars.

HOISTING ENGINES Large or Small for flat or round rope. Double Cylinder Engines, from 6x10 to 18x60. This latter size furnished J. B. Haggin for Olant and Old Abe Co., Black Hill also Corliss Pumping Engines, 20x60, for Hoisting and Pumping Works, for 2,000 feet deep. **Baby Hoists for Prospecting, 4 H. P. to 6 H. P.**

Wire Rope, Safety Cages and any Size and Forms of Cars.

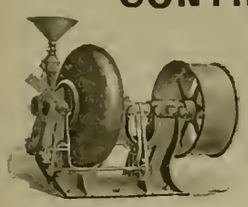
Principal Office and Works, Fulton and Union Sts., Chicago, Illinois.

Frue Ore Concentrator, or Vanner Mills.

Coarse Concentrating Works, Improved Jigs, Crushing Rollers, Sizers, Trommels, Rittenger Tables, and all other adjuncts for the proper working of Gold, Silver and Copper Ores, complete in every detail.

HALLIDIE IMPROVED ORE TRAMWAYS. We refer to Gen. Custer mine, Idaho, 5,000 feet long; Columbus Mine, Col., 4,750 feet long; Mary Murphy mine, Col., 5,000 feet long, all in constant operation.

LEACHING MILLS,



Improved Corliss and Plain Slide Valve Meyer's Cut-off Engines.

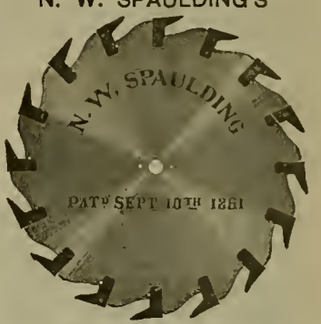
CORLISS ENGINES from 12x36 Cylinders to 30x60. PLAIN SLIDE VALVES from 6x10 to 36x36. BOILERS of every form, made of Pine Iron Works C. H. No. 1 Flange Iron, or Otis Steel. Workmanship the most careful. All Rivets Hand Driven.

McCaskell's Patent Car Wheels and Axles—Best in Use.

New York Office, Walter McDermott, Manag'r, Room 32, No. 2 Wall St.

CONTINENTAL WORKS, BROOKLYN, N. Y.

Duc's Mechanical Atomizer or Pulverizer.



For reducing to an impalpable powder all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORUNDUM, OOLD AND SILVER ORES, BARYTES, COAL, OCHRE, MANGANESE, IRON ORES,

PHOSPHATE ROCK, ETC.

It is simple and not liable to get out of order, Revolving Shell being constructed of Siemens-Martin steel, and all parts mechanica in design and of first-class construction. Weight 5,500 lbs.; heaviest piece, 1,500 lbs. It will pulverize **7 to 10 Tons in 10 Hours** with 30 H. P. For circulars and full particulars apply to or address,

Blasting in Mines—No. 12.

The Principles of Blasting.

The principles upon which the operations of blasting are conducted are few and simple; yet it may he doubted whether they he more than imperfectly understood by those who conduct such operations. Very frequently, holes are bored in certain positions and the explosive substance is inserted in certain quantities, for no better reasou than that such things have been done before. The inevitable consequences of this ignorance are slow progress in the execution of the work aud a large consumption of material. There are indeed, few engineering operations offering such a field for the exercise of ecouomy as that of blasting, or one in wbich the end proposed may be so easily attained. By a skillful application of an accurate kuowledge of the manner in which an explosion acts, and of the structure and mineral composition of rocks, a reduction in the number of the bore-holes and in the quantity of the explosive required may be made, and a rapidity of progress attained uo less remarkable and important than the results attendant on the adoption of machine drilling.

Andre, in his "Coal Miniug," points out and explains the principles which should guide the conduct of operations, as follows:

An explosion is a sndden transformation of a substauce from the solid or liquid into the gaseous form. The actiou is similar to that which goes on in a steam boiler. The application of heat to the water contained in the boiler transforms that substance from the liquid into the gaseous form, and as the gases into which the liquid is couverted tend to occupy a much larger volume than the liquid from which they are derived, a pressure is caused tending to burst the boiler, and the intensity of this pressure will depeud upon the relative volume of the gas. In that case, the transformation of the water iuto gas proceeds slowly, and the full effects are not obtained nntil after a considerable lapse of time. If, however, the water could be suddenly flashed into steam, as happens wben a jet is directed upon a red-hot irou plate, the full pressure would be produced at once, and a result very much like au explosiou would ensue. If, instead of the water, gunpowder were plaeed in the boiler, and beat applied, wben a certain degree of temperature was reached the powder would flash into gas, n the same manner as we have supposed the water to flash into steam, and the same effect of pressure would be produced on the boiler. The pressure of a fluid, it must be borne in mind, is exerted equally in all directions, and consequently every square inch of the metal will be subjected to the same strain. Hence it is obvious that if the boiler bursts, it will yield in the weakest parts, and the line along which the fracture would run in such a case is called the line of least resistance. It will appear from the foregoiug that an explosion is merely the sudden application of great pressure; so sudden, indeed, as to partake of the character of a blow. But though the forces developed are thus suddenly applied, their action is in all respects the same as when the application is gradual and slow; and in considering their action, therefore, it is only necessary to assume a slow evolution of gascs to determine it with precision.

As in the steam boiler the full pressure is not attaiued until the whole of the water has been converted into steam, so in the case of an explosive compound the full pressure upon the containing body is not developed until the whole of the substance has been converted into gas. When gunpowder is fired in the open air, the gases escape as they are formed, and the pressure developed upon the body upon which the substance rests is equal to the resistance opposed by the air to the escape of the gases. The value of this resistauce will obviously increase with the velocity possessed by these gases. It is the pressure due to this cause that forces the rocket to ascend, and it is evident, from the relation subsistiug between the pressure exerted and the velocity of evolution of the gases, that the more rapid the combustion of the substance the greater will be the velocity of ascent. If the rocket-case were made sufficiently strong, and the gases retained within it until the whole of the substauce was transformed, the pressure e erted against the uside of the case would continue to increase as the transformation was effected; and if, when the latter was complete, the gases were allowed to suddenly escape from the end, the rocket would ascend with the maximum attainable velocity, or if retained in its position the gases would exert upon it their maximum lifting force. These facts explain the differeuce in the effects produced by the slow and the quick explosives when fired in the open air. When gunpowder, for example, is fired in this way upon a stone, the downward pressure developed is not great; but when nitro-glycerine is fired by detonation under the same conditions, the stone is crushed or fractured. Even gunpowder will produce similar effects if detonated. The different pressures produced in these cases are chiefly due to the differences in the rapidity with which the trausformation of the substance takes place. Hence we see the value of detouation. When a substance is detonated, the vibration caused by the detonator produces a simultaneous evolution of gases from each molecnle of the substance detonated, and consequently the maximum force is developed at once, instead of gradually, as iu simple explosion. Suppose now a charge of slow

Explosive Placed in a Vertical Bore-Hole

In stroug rock, and fired. Here the gases can escape only in one direction; and as the area upon which the air presses is much less than when the charge was exposed on all sides but one, the velocity of the air must be much greater to allow the same volume of gases to escape in the same time. Consequently the pressure exerted upon the bottom of the hole will be greater than that exerted upon the stone; and as the pressure is necessarily equal in all directions, the same pressure will be exerted against the sides of the holes. As the action of the explosive is quickened, assuming this conditiou possible, the resistance of the air, and consequently the pressure upon the bottom and sides of the holes, will increase until its maximum is reached, when detonation or instantaneous transformation is effected. This maximum, it must be borne in mind, is necessarily equal to the resistance opposed by the atmosphere; and though it may be sufficient to fracture the rock, it does not represent the whole of the force developed by the explosive: a large proportion is expended in giving velocity to the air in the bore-hole, and another portion is lost as heat communicated to the rock. The quantity of heat lost in detonation is less than in simple explosion, because the gases are in contact with the rock during a shorter interval of time. Thus a larger proportion of the force developed is rendered available by detonatiou. Moreover, as gunpowder when detonated may be used in much smaller quantities, the surface of rock exposed to the gases will by such means be proportionately reduced, and consequently the loss of heat will be lessened in a like degree. This coustitutes another source of economy of the force developed by the explosion; but as the greatest loss is occasioned by the comparatively slight resistauce of the air in the bore-hole, the most important saving is to be sought in this direction. It is obvious that by substituting for the air a more strongly resistant substauce, a larger proportiou of the force developed may be reudered available; in other words, a proportionately greater pressure will be exerted upon the sides of the bore-hole. By this means, which is known as "tamping" the hole, a sufficient force may be thrown against the sides of the hole to fracture the rock, which is the end proposed in blasting. It is also obvious that economy of force requires that the materials employed as tamping should be of the most resistant character obtainable.

ZINC PAINT FOR CAST OR WROUGHT IRON.—A process of painting, as a substitute for galvanizing, has been invented by Messrs. Neujeau & Delaite, of Liege. It is specially intended for objects of large dimensions, which can not well he moved, and therefore cannot well he dipped into a bath of melted zinc. The zinc, when finely pounded, is simply mixed with oil and siccative. In this way a varnish is obtained, which is applied with a brush in the usual manner. A single layer is sufficient, but two are preferable. The coated objects can be left as they are, or bronzed or painted as required.

It is reported that the Russian Nihilists have formally sentenced the Czar to death, and much excitement prevails amongt the Socialists in New York City. One of these, a notorious conspirator, sailed for Europe on Saturday. It is said that the royal family of Russia are deeply concerned over the situation, and that even the iron nerve of the Czar has given way before his incessant apprehension.

Boys Here and Elsewhere.

The boys seem to be the coming problem everywhere. It does not sem to matter much whether they are good boys or bad boys, so far as the general trouble is concerned, for in countries where the boys are good the question is, "What can our boys do?" and in countries where boys are bad the question is "What can we do with our boys?" According to the latest statement from abroad it appears that in England, where there are good boys, if boys are good anywhere, there is nothiug for them to do by which they ean earn a decent livelihood. In Californiа, where boys are generally reputed to be indescribably bad, there is plenty to do, but the boys won't do it. And thus the boy becomes a problem nearly everywhere. In fact girls are rather becoming fashionable as offspriug, and the father whose family is petticoated throughout is to be congratulated.

There is a peculiar state of affairs in England, according to the latest local authorities, and a condensation of the mass of conflicting views expressed is as follows:

Those taking part in this interesting discussion agree on only one point, namely, the difficulty of finding openings in professional or mercantile life, or even of securing employment for the sons of the middle class. The opinion most commonly expressed is that fathers of that class—merchants, lawyers and tradesmen—make the mistake of educating their sons to a higher level of pursuits than they ought, and neglect to provide for the contingency of mediocrity by apprenticing them to mechanical callings of a lower social grade. There are many, however, who maintain that the artisans are mainly at fault in over-educating their boys, and in this way rendering them discontented with their own rank in society. It is urged that there would be room enough for the boys of the middle class, if the sons of working people were not encouraged to rise above their station and push their way into clerkships and professional vacancies. The fact, moreover, that skilled laborers are constantly emigrating in large numbers is adduced as a convincing proof that the mechanical trades are already overcrowded, and that the sous of the middle class will not gain any material advantage by a retrograde movement.

By analyzing these statements it would appear that the trouble in England is too many boys. If the factories lacked hands, if tradesmen were short of clerks, if farmers had no workmeu, if machine shops were silent because the metal-mongers were few—then it would do to say, perhaps, that the boys were being over-educated, or rather falsely educated, because rightly applied processes of education do not war with industry. But there is no lack of help in the trades and manufactures, and no opening for profitable employment of the boys, for we read again as follows:

The man who suggests the occupation of lace draughtsman as a suitable one for middle class boys is immediately reminded from Nottingham that "every gentleman" in that town is making his son a draughtsman, and that the trade is "flooded out," so that experienced operators, after a seven years' apprenticeship can only earn from eighteeu to twenty shillings a week. The proposal that a "gentleman's regiment" shall be recruited from the class that cannot find clerkships or professional employment is at once amended so as to restrict its membership to university graduates who are unable to earn a living. An outcry for more dentists and veterinary surgeons is met with a counterclaim that there are so many of them already that they are emigratiug to Australia.

Thus it seems that England is nearly as badly off with her good boys as we are with our bad ones—they are both eating their heads off and doing nothing. If there could be arranged a sort of an internatioual boy exchauge, it would be a grand thing for us. If we had a few thousands of those good English boys who are calling for work and can't get it, just think how happy would be a father's lot in this state, for such a well disposed force of workers would make every family independent of the hired-help puzzle, and our fruit-growers could order their boys by the score, iustall them in their parlors, and marry their daughters to them with perfect safety, for they are good boys, well educated and crying for work.

In return for this boon England would receive our boys who will not work, will not behave themselves, will not do anything but raise Cain generally. Verily, the sound of the walloping in English homes would be loud, nor would the rod be spared nutil the boys were beaten into some condition of decency aud obedience. This would be a great humanitarian enterprise: the English youth would get what they seem most to yearn for, and that is a chance to work, and the Californiа youth would get what they most need—a good, generous and persevering walloping.

British Postal Service.

The following interesting figures have been compiled from the annual report of the Postmaster-General of Great Britain and Ireland for the fiscal year ending March 31, 1883 Number of letters delivered in the United Kingdom duriug the year, 1,280,636,200—increase, 42 per cent; postal cards, 144,016,200—increase 6.4 per cent; book packets and circulars, 288,206,400—increase 6.3 per cent; and newspapers, 140,682,600—the slight decrease is owing to their being sent as parcels. One London firm posted 132,000 letters for a single mail, and another firm 167,000 postal cards, while circulars posted by single firms at one time numbered from 44,000 to 56,000. The average of letters per capita was 40 in England and Wales, 30 in Scotland, 16 in Ireland. Mr. Fawcett, Postmaster-General, estimated that the average number of letters per capita in 1881 was, for the United States, 21; France, 15; Germany, 13; Italy, 6; and Spain, 5. Post-offices in the United Kingdom number 15,406, employing 44,600 permanent officers. Of this number 2,561 are women, 455 clerks, and 2,106 counter women. On the retired list are 355 officers with pensions aggregating $884,130 per annum. The "good conduct stripe" for letter-carriers, which was formally confined to London, has been extended to the provinces, at a cost of $315,000. A stripe entitles the wearer to 25 cents extra pay per week, and by continued good conduct he can win three stripes. Reply postal cards have been introdnced, but have met with poor success.

After a careful examination of these figures, postoffice officials here assert that the postal system of this country is operated at a cost much less than that of the United Kingdom, especially when the great extent of country is taken into consideratiou.

In the United Kingdom, 32,092,026 telegraph messages were sent for the year 1883, an increase of 746,165 as compared with 1882. The number of messages sent in London was 12,374,707, against 2,071,034 in 1881–2. During the past year 102 postoffices and 45 railway station offices were opened for telegraphic work, making the total number of telegraph offices 57,742.

The gross revenue from telegraph was $8,740,300, and net revenne $1,177,850.

News in Brief.

SECRETARY FOLGER says it is probable he will issue a call for three per cent bonds. The amount of the call is not decided on.

AT Grass Valley the other day a little girl was seriously injured by being dragged some distance by a calf which she was holding with a rope.

THE Treasury Department has purchased 404,000 ounces of fine silver for delivery at the Philadelphia, New Orleans and San Francisco mints.

THE highest point on the Rocky Mountains reached by the Northern Pacific is 1,200 feet below the summit of the Sierras on the Central Pacific.

A FEW gentlemen of London have contributed £6,000 to pay the preliminary expenses of a six months' session of Moody and Sankey at Islington.

IT is charged that sick and disabled animals condemned at the stockyards are brought across the line and retailed in Kansas City as healthy beef. The subject is to be investigated.

A CABLEGRAM announces the death of Professor William Danton, the geologist. He is supposed to have been in Java at the time of the earthquake, and to have been one of the victims.

THREE well dressed Chinamen were in Key Port, New Jersey, during the past week, endeavoring to find a place in which to start a laundry, but were unsuccessful. No landlord would rent to them.

THE last spike of the Kansas City, Springfield and Memphis railroad was driven at six o'clock Saturday evening, thirty miles west of Memphis, and there is now an unbroken line between those cities.

THE men in four of the prescription houses in Pittsburg have been ordered out by the American Flint Glass Union, because the manufacturers employed boys to do journeymen's work. About two hundred men are idle.

UNDERSTAND THE SITUATION.—The Chinamen have already begun to realize the benefits of shutting out competition from an increase of their numbers, and are generally demanding an increase of wages. This is being done both by house and field hands, and the situation will be serious to the housewife unless there are considerable accessions of more desirable people than the Chinese.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From the official list of U. S. Patents in DEWEY & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 252 Market St., S. F.

FOR WEEK ENDING OCTOBER 9, 1883.

280,260. CHAFE PAD FOR HARNESS—C. W. Burgtorf, Petaluma, Cal.

280,293.—SEEDER AND HARROW—D. W. Clinton, Lemoore, Cal.

280,401. FIRE PROOF BUILDING—W. H. Dolman, St. Helen, Or.

280,436.—GRAIN HEADER—F. Hickman, Red Bluff, Cal.

280,442.—PLASTIC COMPOSITION FOR TAILORS' CUTTING BOARDS, ETC.—M. Hughes, S. F.

280,314.—TWO-WHEELED VEHICLE—Geo. Larsen, San Leandro, Cal.

280,316.—DERRICK TABLE AND FEEDER FOR THRASHING MACHINE—M. N. Lanfenburg, S. F.

280,207. CAR COUPLING—A. Lenhart, Portland, Or.

280,451. HYDRAULIC ELEVATOR—Lesouru & Lotan, Portland, Or.

280,223. ROCK BREAKER—L. Radovich, S. F.

280,342.—ORE CONCENTRATOR—W. E. Surk, Leadville, Col.

280,509.—FRUIT DRIER—C. W. Vetter, Ukiah, Cal.

280,564.—TRACK LAYING MACHINE—F. F. Voigt, Walla Walla, W. T.

280,352.—TICKET DISTRIBUTING BOX—S. B. Whitehead, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific Coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

GANG PLOW.—James M. Fix, Bird's Landing, Solano Co., Cal. This patent covers certain improvements in that class of gang plows in which the axle is pivoted, and is adapted to be moved obliquely with the line of travel, whereby it is rendered specially serviceable for sidehill work. One of the improvements is in the racks with which the levers to raise the plows engage. The improvement consists in doing away with certain strains by bolting these racks right down to the axle instead of on top of high standards, the axle being made wide for the purpose. Another improvement consists in the adaptation of the cranks which raise and lower the axles to receive the wheels at either end. By this means the wheels may be kept out of line or nearer in line, as desired. The invention also provides a guard and protector for the spring of the crank levers.

TRACK LAYING MACHINE.—F. F. Voigt, Walla Walla, W. T. No. 286,564. Dated Oct. 9, 1883. This invention relates to the class of track laying machines, in which a peculiar car provided with the necessary appliances for handling the material is joined to and made to precede a construction train carrying the material. It consists in a novel means for carrying the material to the front, in a novel means for handling the cross-ties and rails, in a novel means for switching the material trucks, to avoid interference, and in certain other details of construction.

CHAFE PAD FOR HARNESS.—Chas. W. Burgtorf, Petaluma. No. 286,260. Dated Oct. 17, 1883. This pad is intended to prevent chafing on the side of the horse. It consists in a flap of leather sewed into the bend or fold of the hame tug, just inside or back of the trace buckle, and adapted to receive the back-hand, whereby it is held flat, and said buckle is prevented from rubbing or chafing the side of the horse. This invention is particularly adapted for double harness, as the trace buckle is brought in closer proximity to the horse than in single harness.

TWO-WHEELED VEHICLE.—George Larsen, assignor of one-half to John F. Hopper, San Leandro. No. 286,314. Dated Oct. 9, 1883. This invention relates to certain new and useful improvements in two-wheeled vehicles, and it consists in a novel connection between the shafts and axle, the object of which is to permit the independent movement of the shafts while affording support to the axle, to prevent it from turning, and also to admit of regulating the height of the shafts.

POST DRIVER.—Harry E. Fairman, Plymouth, Michigan. No. 285,881. Dated October 2, 1882. The improvements in this post driver consist in means for adjusting the vertical guides for raising and tripping the weight for setting the machine, and in numerous details of construction which render the appliance more effective for its purpose.

INVALID mothers, weak children, nervous and fretful infants are benefited by using Brown's Iron Bitters. Harmless but efficacious.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased, and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete, and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

A Prospector in Alaska.

As there has been so much interest expressed of late as to the mines of Alaska, and as many are inquiring in relation to the same, we publish the following letter from Jacob Knause, now in Alaska, to Mike Burns, of Helena:

JUNEAU, Alaska.

You wished to know something about this country. I will try and describe it as well as I can. The placers are nothing extra. With the exception of about six claims, they do not pay good wages. They are all situated on the hillside, where no one would look for gold. The seasons are very short. They did not get to work this year until June, and they will probably have to shut down in September, or October at the latest. It is the most disagreeable place to work in the ground sluice I ever saw. It has rained almost every day since we got here, but if it did not rain they would have to stop work for the want of water. The diggings are all in what is called the basin. It is high up in the hills, and a few frosty nights dries up all the water. Last year the boys did not get to clean up their last run, as it froze early and did not thaw out again until this spring. The gold is all very fine, and goes but $16 to the ounce, and has to be clean to do that. There is an island across the bay from Juneau, which is called Douglas Island, where they found pretty good pay. From one claim, situated on the beach, and called the Ready Bullion, they took out $20 per day to the man for awhile, but that is worked out. Others were struck a little higher up that paid well, but are not doing much now. As for the quartz, it is pretty good what there is to be seen. They have done nothing with it yet. There are about fifty locations in the basin that no work has been done on yet, except enough to hold them. The float is rich. One howlder that weighed almost 1,000 pounds was crushed last September, and they got about $1,200 out of it, besides a large amount of specimens. The quartz is almost all galena ore, and the gold can be seen sprinkled in the galena. There are two five-stamp mills here; one about half-way between here and the basin, where it was put for custom work, but is not running this summer. The other is on Douglas Island, on the Paris quartz location, brought there for prospecting the claim. I have been working in the tunnel there for about seven weeks. The quartz is low grade, but the largest deposit that was ever known. It is about 600 feet wide, and how long they do not know. There are six locations on it, or where they think it is. It dips under the slate in places, and then comes out again in a large bunch. There is very little country rock in it. Some of it works much higher than others, but the whole hill will pay, I think—that is, the way it will be worked. There will be a 100-stamp mill upon it in the spring, so they say. We ran out of powder, and had to lay off until the steamer gets here. The country here is very rough, and covered with moss. You can not prospect except on the mountain tops or where the water cuts through the hill. The timber is very dense—hemlock, spruce and alder being the only kinds found here. The underbrush is so thick you can hardly get through. It is mostly herry bushes and "Devil's Chips"—well named, too. It is a long curved stem with leaves about a foot wide on top. The stem is covered with thorns, which stick into the flesh wherever it touches; so you see it is a fine place to prospect in. A party of five have just got back from a trip about 400 miles northwest of here, but did not strike any thing but a deposit of black sand. It is pretty, but I do not see how they can work it. It is very heavy and mostly magnetic iron. It is on the beach. The place is called Yucatat. It was where the two men were killed three years ago by the Indians. There are three parties out from here this year on the headwaters of the Yukon. They go from here in boats to a place called Chittcat, where they leave their boats and cross the range, about 30 miles. They have to pay $9 a 100 for packing across the range. Then they whip-saw lumber and build boats. There is a chain of lakes from there down to the Yukon River, and some terribly rough canyons to go through when they strike the river. It is all up stream work.

GOOD health, rosy cheeks and beautiful skin, ladies can get by using Brown's Iron Bitters.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced and Tulare counties.
JARED C. HOAG—California.
B. W. CROWELL—Colorado, Utah and Montana.
M. H. JOSEPH—Eureka, Nev.
I. M. LEHBY—San Bernardino and San Diego counties.
J. J. BARTELL—Santa Clara county.
H. W. FOLSOM—Los Angeles county.
C. E. CURTIS—Kern and Inyo counties.
A. S. DENNIS—San Mateo county.
GEO. FRANCOEUR—Shasta county.
J. W. BOYER—Contra Costa county.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing only one cent) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent.

SEEK

health and avoid sickness. Instead of feeling tired and worn out, instead of aches and pains, wouldn't you rather feel fresh and strong?

You can continue feeling miserable and good for nothing, and no one but yourself can find fault, but if you are tired of that kind of life, you can change it if you choose.

How? By getting one bottle of BROWN' IRON BITTERS, and taking it regularly according to directions.

Mansfield, Ohio, Nov. 26, 188r.

Gentlemen:—I have suffered with pain in my side and back, and great soreness on my breast, with shooting pains all through my body, attended with great weakness, depression of spirits, and loss of appetite. I have taken several different medicines, and was treated by prominent physicians for my liver, kidneys, and spleen, but I got no relief. I thought I would try Brown's Iron Bitters; I have now taken one bottle and a half and am about well—pain in side and back all gone—soreness all out of my breast, and I have a good appetite, and am gaining in strength and flesh. It can justly be called the *king of medicines*.

JOHN K. ALLENDER.

BROWN'S IRON BITTERS is composed of Iron in soluble form; Cinchona the great tonic, together with other standard remedies, making a remarkable non-alcoholic tonic, which will cure Dyspepsia, Indigestion, Malaria, Weakness, and relieve all Lung and Kidney diseases.

NOTICE TO CREDITORS.

ESTATE OF ROSEMOND GREENWOOD, deceased.—Notice is hereby given by the undersigned executor and executrix of the last will and testament of Rosemond Greenwood, deceased, to the creditors of, and all persons having claims against the said deceased, to exhibit them with the necessary vouchers, within four (4) months after the first publication of this notice, to the said executor and executrix, at the office of E. W. Blaney, Esq., attorney-at-law, No 526 Montgomery Street, the same being the place for the transaction of the business of said estate, in the City and County of San Francisco.

Dated at San Francisco, the 2d day of October, 1883.

GEORGE SPAULDING,
MARY WILLIAMS,
Executor and Executrix of the last Will and Testament of ROSEMOND GREENWOOD, deceased.

Books for Miners and Millmen.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, with 120 lithographic diagrams. 1887. This work is unequaled by any other published embracing the subjects treated. Postpaid $7.50. Printed and sold by Dewey & Co., S. F.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES (Second Edition, 1880), and the Extraction of their Respective Metals without Quicksilver. Illustrated 156 pages. A valuable and carefully written work. Postpaid, $3. Sold by Dewey & Co., S. F.

AARON'S LEACHING GOLD AND SILVER ORES.—The most complete hand-book on the subject extant, 164 pages octavo Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by Dewey & Co., S. F.

MINING, ENGINEERING, MECHANICAL, FARMING, SCIENTIFIC, INDUSTRIAL AND NEW BOOKS in general can be ordered through Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS, S. F., at publishers' rates.

PHILLIPS'S EXPLORERS' AND ASSAYERS' COMPANION (Third Edition). Price of Vol. 1, post-paid, $6. Sold by Dewey & Co., S. F.

INVENTORS. L. PETERSON, MODEL MAKER,

258 Market St., N. E. cor. Front, up-stairs, San Francisco. Experimental machinery and all kind of models, tin, copper and brass work.

INFORMATION WANTED.—Information is wanted of Wm. Erskine, who has been living near Hailey, Alturas county, Idaho Territory, for two years past. His wife has not heard from him since last Spring. He was President of the Miners' Union of Silver City, Idaho, five or six years ago. Any news of him would be thankfully received by Mrs. Hannah Erskine, of Nevada City, Cal., or R. H. McDonald, Los Angeles, Cal.

Dewey & Co. { 252 Market st. } Patent Agt's.

Mining Companies.

Persons interested in incorporations will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for advertising.

ASSESSMENT NOTICE.

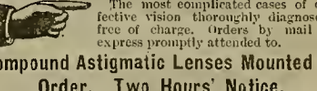
Seaton Gold Mining Company.—Location of principal place of business, San Francisco, California; location of works, Drytown, Amador county, Cal.

NOTICE is hereby given that at a meeting of the Board of Directors, held on the 25th day of September, 1883, an assessment (No. 1) of ten cents (10c.) per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 528 California Street, San Francisco, Cal.

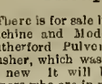
Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1883, will be delinquent and advertised for sale, at public auction, and unless payment is made before, will be sold on Monday, the 19th day of November, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. MARTIN, Secretary.

OFFICE Room 6, No. 528 California Street, San Francisco, California.



Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.
No. 252 Market St. Elevator, 12 Front St., S. F. Telephone No. 658.
A. T. DEWEY. W. B. EWER. GEO. H. STRONG.

Only "PEBBLE" Establishment.

1863  1883

MULLER'S OPTICAL DEPOT,
135 Montgomery St., near Bush.
SPECIALTY FOR 33 YEARS.

The most complicated cases of defective vision thoroughly diagnosed, free of charge. Orders by mail or express promptly attended to.

Compound Astigmatic Lenses Mounted to Order. Two Hours' Notice.

Cheap Ore Pulverizer.

There is for sale in this city, by I. A. Heald, American Machine and Model Works, 111 and 113 First St., a Rutherford Pulverizer, an improved revolving barrel crusher, which was only used a few times and is as good as new. It will be sold very much below cost, and miners who are in need of such an appliance for a small mine will do well to make inquiries concerning it. It is suitable for a pulverizing mill for powder or other substances. Reference as to above can be had upon applying to this office.

COMPLIMENTARY SAMPLES OF THIS PAPER are occasionally sent to parties connected with the interests specially represented in its columns. Persons so receiving copies are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $4 a year. Extra copies mailed for 10 cents, if ordered soon enough. Personal attention will be called to this (as well as other notices, at times), by turning a loaf.

Iron and Machine Works.

Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given to the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, or sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, rivetted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

WATER JACKET SMELTING FURNACES
—FOR—
Galena Silver & Copper Ores.
The PACIFIC WATER JACKET SMELTERS embrace many features that are entirely new and of great practical utility, which are covered by letters patent.
No other furnaces can compare with these for durability and in capacity for uninterrupted work.
MORE THAN ONE HUNDRED of them are now running on the Pacific Coast, giving results never before obtained as regards continuous running, economy of fuel, grade and quality of bullion produced. We are prepared to demonstrate by facts the claims here made.
These Smelters are shipped in a complete state, requiring no brick or stone work, except that for the crucible, thus saving great expense and loss of time in construction.
Complete smelting plants made to order of any capacity and with all the improvements that experience has suggested as valuable in this class of machinery. Skilled and experienced smelters furnished when desired to superintend construction and running of furnaces. Estimates given upon application. Send for circular.

MINING MACHINERY

INCLUDING

Steel Water Jacket Smelting Furnace,

Quartz Mills, Concentration Works, Hoisting Apparatus, and all classes of Machinery employed in Mining and Reduction of Ores.

PORTABLE AND STATIONARY

STEAM ENGINES

From Ten to Two Hundred Horse Power, Steam Boilers of any Style and Capacity.

SAW MILLS

Adapted to wants of the Planter, Miner, or for the manufacture of Merchant Lumber, Prices ranging from

$200

Upwards, and of Capacity from 2,000 to 50,000 Feet per day. Shaftings, Hangers, Pulleys, Gearing, and all Appliances for the Transmission of Power.

LANE & BODLEY CO., Cincinnati,

GOLD QUARTZ and PLACER MINERS'

Silver Plated

AMALGAMATING PLATES,

For Saving Gold.

Every description of plates for Quartz Mills and Wet or Dry Placer Amalgamator Machines made to order, corrugated or plain.

OVER 2,000 ORDERS FILLED.

The most extensive and successful manufacturer of these plates in the United States. Will fill orders for delivery in Rocky Mountain and Pacific Coast Mining States at lower prices than any other manufacturer.

Old Mining Plates Replated. Old Plates bought, or gold separated for low percentage of result.

SEND FOR PRICE LIST.

HYDRAULIC

MINERS:

THE ABOVE CUT REPRESENTS OUR NEW IMPROVED GIANT, which we recommend as being the Best Hydraulic Machine ever manufactured. They are SIMPLER, LIGHTER, CHEAPER AND MORE EASILY WORKED than any style heretofore made. The machine is fully protected by patents owned by us, and we will guarantee protection to our customers. Send for Circular and Price List.

HOSKIN BROS.,

MARYSVILLE, - - - - - - - CALIFORNIA.

With Adiustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts

Mining Machinery Depot,

PARKE & LACY,

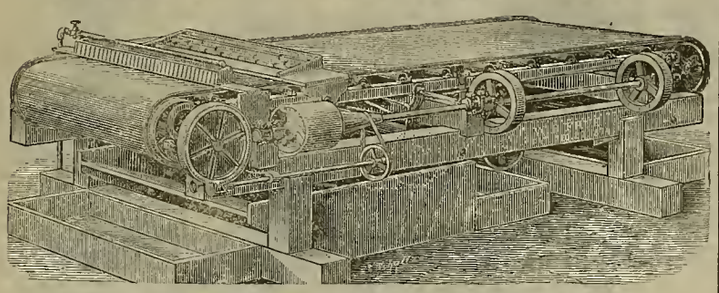
21 and 23 Fremont Street. S. F.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Ahsolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.



Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Ahsolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

$1,000 CHALLENCE!

THE FRUE ORE CONCENTRATOR,

—OR—

VANNING MACHINE.

Over 400 are now in use, giving entire satisfaction. Saves from 40 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal.

A machine can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont Street.

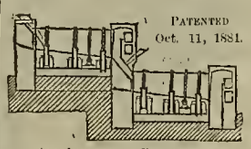
To those intending to manufacture or purchase the so-called "Triumph" Concentrator, we herewith state:

That legal advice has been given that *all shaking motion* applied to an *endless traveling* belt used for concentration of ores is an infringement on patents held and owned by the Frue Vanning Machine Company

That suit has been commenced in New York against an end-shake machine similar to the Triumph, and that as soon as decision is reached in the courts there, proceedings will be taken against all Western infringements.

That the patent laws make *users* of infringements responsible as well as makers, and the public is therefore warned that there is considerable risk in purchasing any end-shake machine until our various patents have been decided.

That if there are those who for any reason prefer an end-shaks machine, we can manufacture and sell to such machine of that description, as efficient as the Triumph, and at a lower price, and no liability for infringement will then be incurred by the purchaser.



That we shall protect ourselves against any one making, selling or using any machine infringing any of our patents. Patented July 9, 1867; May 4, 1869; Dec. 22, 1874; Sept. 2, 1879; April 27, 1880. Patents applied for.

That we are, and have been, ready at any time, to make a competitive trial against the Triumph, or any other machine, for stakes of $1,000.

ADAMS & CARTER, Agents Frue Vanning Machine Company,

Room 7, 109 California Street, - - - SAN FRANCISCO, CAL

Nov. 6, 1882

PATENTED Oct. 11, 1881.

ALL INFRINGERS PROSECUTED.

NEVIN'S CELEBRATED

Patent Ore Roasting and Chloridizing

FURNACE.

Working up to 93 per cent. of Fire Assay, using 25 per cent. less salt since July, 1882. LICENSES FOR USE FOR SALE, or FURNACES CONSTRUCTED. Address R. A. NEVIN. Patentee. Box 1676, SAN FRANCISCO, CAL.

JET PUMPS.

THE CHEAPEST AND BEST

STEAM PUMP for Lifts from 10 to 70 ft.

FOR IRRIGATING PURPOSES

And all General Work where a Simple Durable Pump is Reouired.

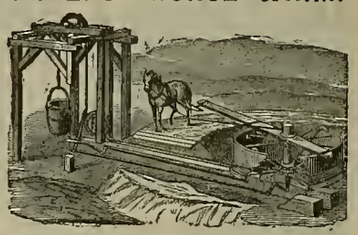
NO VALVES! NO PISTON!

NO OIL REQUIRED!

Can be Run by a Child.

EACH PUMP GUARANTEED.

PRICE—One-tenth of an ordinary Steam Pump, same capacity.



Call and See One in Actual Operation.

CABLE RAILROAD EDITION—TWENTY-FOUR PAGES.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, OCTOBER 27, 1883.

VOLUME XLVII Number 17.

THE MARKET STREET CABLE ROAD.

A DETAILED DESCRIPTION OF OUR LATEST AND MOST IMPORTANT CABLE LINE.

One of the regular "sights" of San Francisco, to the tourist or visitor, is its cable railroad system, now illustrated by numerous lines in daily operation. The latest of these, and by far the most extensive one, is the Market street line, which, with its several branches, goes through the heart of the city, and from the water-front to the suburbs. The projectors of this road are men of wealth and experience in railroad building, and determined to build the road in a manner that would make it as substantial as possible, and have spared no expense to that end. The road cost into the millions. Its equipment is first-class in every respect; and it has been not only satisfactory to its owners, but to the public. Traveling mainly on a street where there are some eight other lines of street cars, it immediately became the favorite, owing to the convenience and comfort of its cars, the speed at which they travel, and the frequency at which they pass.

VIEW AT THE FERRY TERMINUS OF THE MARKET STREET CABLE RAILWAY.

On account of the novel features of this new road, and the general interest taken in the subject of these cable roads, we have had a number of engravings specially made to accompany this description. These will give not only a good general idea of the appearance of the cars, roadbed, etc., but many details of construction also. To engineers, this number of the PRESS contains much data of interest, and the general reader will also find it valuable for reference. The cable railroad system is now spreading so rapidly that all the large cities in the United States will soon have cable lines. As we built the first of these roads here, our experience is useful to all others; and, no doubt, most of the roads built in the future will look to those in this city as examples for guidance.

The building of this road has had the effect of enlivening, so to speak, a large tract of this city. For some years, south of Market street and out by Valencia, the city has been rather "slow," the northern and northwestern portions improving much more rapidly, and having improvements of better character. The length of time it took to get out towards the Mission and thereabouts, or even Market street to 10th and 12th streets, was detrimental to those portions of the city. The cable cars now go from the ferry to the end of Valencia street in 34 minutes, and run frequently. All those portions of the city which the road or its branches tap have already felt the good influence of rapid communication, and the improvements will be even more plainly manifest within the next year.

The Road and its Branches.

The main line of the road runs on the principal thoroughfare of San Francisco—Market street. The streets north and south of this all open into it, and the traffic is larger than on any other avenue in the city. Not only do the north and south streets, such as Kearny, Dupont and Stockton, and Second, Third and Fourth, open into Market, but the streets north of it running across Kearny and Dupont, such as O'Farrell, Sutter, Post, Geary, etc., also open into it. This latter line of streets run at an angle from Market. The lower ends of the cables of the Sutter and Geary street cable roads are at the junction of these respective streets and Market. The peculiar central position of Market street, therefore, makes the road a highly important one. It was supposed by many that a cable railroad on that thoroughfare would be almost impracticable, owing to its crowded state at certain periods of the day. Many thought the cars would have to be moved so slowly that they would be unpopular. Experience has, however, proven these fears to have been unfounded. In fact, the line makes better time than any of the cable roads, the cable running about eight miles an hour; and, including an average of 30 stops, the cars run from one end to the other at a rate of about 7½ miles an hour.

It has been found, too, that the speed at which the cars are run tends to make people more cautious than on slower roads. Moreover, the track is kept clear easily. Teamsters know that the cars run fast, and at the first sound of the gong clear the track, not taking their time about it, as is apt to be the case with slower roads. People are not apt to try to run across in front of these cars, but seem rather to prefer letting them pass. The quick speed, therefore, has been advantageous to the road, and is very satisfactory to the public.

There are several branches to this road, transfers for which are given passengers without extra charge, the fare being five cents. At Fifth street is a horse-car branch, one mile long, running south. At McAllister street is a cable railroad branch, which will be in running order in about a month. There will be a separate cable to Market street, run by a separate engine, and the cars will switch off from this to the Market street cable at the junction of the two streets. This branch makes another complete line from Golden Gate Park to the ferry.

At Hayes street there is a horse-car branch out to Hayes Valley, through a populous neighborhood. The next branch to the right is that of Haight street. Every other car on the main line switches off here to go out Haight street to Golden Gate Park. We give a profile of this line in another column. At the end of the Haight street line a road is being built to run as far as the Pacific Ocean beach and Cliff House. This will be run by steam dummies, and will be a separate line from Haight street, though connecting with it. This ocean line will soon be done, and it will be possible to go to the ocean beach for ten cents. The Haight street branch is a very important one, and the city is building rapidly out in that direction. Opposite the main line engine-house is the Market street extension branch, soon to be run by an independent cable, provision having been made in the engine houses for the cable for this branch. It is one mile long. Baldwin locomotive dummies are now running the cars on this branch.

The grade on Market street is 3½ feet in 100. The grade on Haight street is about 12½ feet

(CONTINUED ON PAGE 295.)

Copper Slime Treatment.

The following paper was read before the American Institute of Mining Engineers, by F. G. Coggin, of Lake Linden, Michigan, at the Roanoke, Va., meeting:

"If you could only get that motion into a machine," said a gentlemen, as he watched the process of making a "van" on a shovel, and saw the copper roll up to the highest point, "it would beat the world for slime dressing." This idea has led to many an effort to get that peculiar motion, called the "vanning motion;" and so cams, eccentrics, eccentric gears, levers, bell-cranks, toggle-joints, links, springs, etc., have been brought into requisition, while a contribution has been laid upon all the conceivable motions, rolling, tumbling, swinging, jerking, tossing, dropping, tripping, intermittent, regular, and irregular, or a combination of some of them, to which have been added percussion, concussion, and more discussion—all in a vain attempt to combine in a single machine the consecutive motions of the shovel, in washing, flowing, and tossing the van. The Patent Office Reports, and the various mills of the country, show, as a result of this, a lot of gimcracks, most of which never went beyond a first trial, finding their way to the scrap-heap. Others still running might as well be there; while some have considerable merit for dressing other and richer sands than copper.

It does look tempting to see that clean edge of

Copper Climbing up the Shovel-Blade;

But those who have seen in it such visions of large fortunes have not considered the time it takes to make a van, compared with the small quantity treated upon the shovel; and this points to the reason for the failure of all that class of machines called "vanning machines," when used for dressing copper slimes, namely, a lack of capacity. The writer has come to this conclusion through an experience with the Rittinger side percussion-table of the most improved make, sent from Germany to the Calumet and Hecla Mining Company, and with the Ellenbecker tables, used by the same company, both of which are good types of that class of machines. In both of these machines, the tables are suspended by rods which allow them to swing, and they can also be adjusted for the purpose of varying the inclination of the table. In the Rittinger machine, the motion of the table is at a right angle to the flow of the slime, being produced by a wiper-cam which throws the table against a spring, which throws it quickly back against a stop, the percussion throwing up the mineral. In the Ellenbecker table, the motion is with the flow of the slime, and has a quick return, produced by the use of eccentric gears, the idea of the latter being taken from the valve-gear of the old Ball steam stamp. The estimated capacity of the Rittinger machine was eight tons per twenty-four hours; but it would not properly treat over five tons in that time, or about fifty pounds per square foot of floor space taken up by the machine. The Ellenbecker table has about the same capacity. The assay of slime was about 1.3 per cent; that of the tails, .97 per cent. This is not considered very good work. Of other

Machines for Dressing Slimes,

the best known are the fixed round buddle and the revolving table; perhaps the Frue vanner may be included in this class of machines, although, having had no experience with the latter, I can say nothing with reference to its capabilities. The principle governing the concentration upon both the former is the same. In the one the table is fixed, while the distributing and washing apparatus revolves; in the other the table revolves, while the rest of the apparatus is fixed. The revolving table is the most largely used in this country—the design of Mr. Evans, of the Atlantic Mine, Michigan—being almost exclusively used in the copper mills of Upper Michigan. This differs little from the German revolving table, except that it has a "dead-head" at the centre from 6 to 8 feet in diameter, one-half of which is used for distributing the slime, the other half being used for clear water. The outer rim of the latter is a spiral, the surface broadening towards that point where the concentration is washed off. I have also made this rim in steps of from six to ten inches, with good results.

It may be said that this dead-head takes up a large area from the table; but this area, being immediately around the centre of the table, is of little or no value for settlement; for the current of the slime delivered at the centre is too rapid for settlement to take place until it has spread itself over an area equal to that of the dead-head, the office of which is to spread the slime moderately and evenly upon the revolving table.

In a paper read before the Institute at its last meeting in Boston, by Mr. R. P. Rothwell, it was stated that in the German dressing-works the revolving tables were being superseded by the Linkenbach fixed round buddle, for the apparent reason that the revolving tables, if over 17 feet in diameter, were expensive to build, were unwieldy, and necessitated more operations to concentrate. Some two years ago, a complete set of drawings of the Linkenbach buddle, with a set of irons for the same, were sent to the Calumet and Hecla Mining Company, with a view to their introduction, the German estimate of the cost of a single buddle being $717. A thorough examination of the drawings, with their description, and of the irons sent, compared with the practical workings, etc., of

The Evans Table,

led to the adoption of the latter for several reasons:

1. The cost of the Evans table, with only moderate facilities for its construction, will not exceed $225. The fixed buddle, with the inventor's estimate of the material and labor, at prices paid for such in this section, would cost at least four times as much, or $900. This, for the number of tables required by the Calumet and Hecla Company to properly dress its slimes, would make a difference in the first cost of $20,000.

2. The fixed buddle, with its revolving apparatus, is more complicated than the Evans table, and therefore more liable to get out of order. If there was anything to compensate for the extra cost of the fixed buddle, it would not matter; but there does not seem to be any thing. The capacity of the two machines seems to be about alike; that is, from 12 to 13 tons of slime (weighed dry) per twenty-four hours. This refers to a table 20 feet in diameter, as compared with those referred to by Mr. Rothwell, said to be about 26 feet in diameter. Comparing the capacity of the Evans table with that of the Rittinger percussion-table, per square foot of floor space taken up, the former gives 96 pounds of slimes against 50 pounds by the latter, a gain in favor of the Evans table, or round buddle, of 92 per cent. The water required by the buddle and table does not seem to vary much. Taking Mr. Rothwell's figures, the minimum, 5½ tons of slime in ten hours with 19 gallons per minute, gives about 2,100 gallons of water to the ton of sand. Experiments with the Evans table give about 2,000 gallons to the ton. There is no difficulty in making an Evans table 20 feet in diameter or more, without making it unwieldly, and at a cost specified above. Nor is there any difficulty in putting one table above another, either on the same shaft, to be driven together, or on a framework, to be driven independently; and in either case, the power to drive them is of no consequence, as the table revolves upon a steel step 1¼ inches in diameter, and a child could turn one even while loaded. With respect to the surface, those used in Upper Michigan, being made of wood, have a wood surface which works very well. One table has a canvas surface, which is said to work well for certain grades of copper. I think that the best surface for the peculiar stuff to be treated can only be determined by experiment. I understand that in Germany much experimenting has been done in this line without fixing upon any one surface suitable to all materials and conditions, marble, slate, cement, wood, rubber, canvas, etc., each having been found best under as many conditions. This holds true with respect to nearly all machines, and many a machine that is doing its best in one place is condemned in another, because it will not give as good results under varying conditions, when perhaps only a slight modification in the machine itself was needed. As well condemn the saw that will not split the board it has so easily cut in two.

As to Sizing the Material

For the table, I am not yet convinced as to the necessity for it in copper dressing. It seems to me that the necessity for it is brought about only by poor separation at the jigs. With the separators usually used, the trouble has been that if enough hydraulic is used to keep the jigs free from slime, it carries over the tail of the separator a good deal of sand that should remain on the jigs, and which is detrimental to good work on the table. This is true of all separators where the excess of the hydraulic has to pass up through a narrow aperture, through which also the mineral must fall. I suppose as much effort has been made to secure a perfect separation as in any other line in mineral washing. Many have worked with a wrong end in view, and I may add, in hydraulic separation, an impossible end; namely, a perfect sizing of the particles. Not only that, but for jigging purposes, a perfect sizing is not desirable, especially with the coarser sands; but as this is not within the province of slime treatment, I will not stop to discuss it.

However necessary it may be to classify the slimes before going to the tables, it is certainly necessary to first get all the slime free from the sand that should remain on the jigs. I am glad to announce that this has at last been accomplished with the separator recently adopted by the Calumet and Hecla Company, and secured by letters patent. In the usual method of washing and separation, where the mineral has to drop through a narrow aperture, against a rapid and direct current of water, if the current is strong enough to keep back the heaviest particles of slime, it will also keep back the lighter particles of sand, suitable only for the jigs. Moreover, a great deal of the slime clings to the larger particles of the sand, and must be washed off in the separator if good work is desired. Heretofore I have seen no separator that would do this. In the new separator alluded to, the hydraulic is brought into each compartment from behind, by a pipe whose discharge is opposite to and near the spigot. Over this pipe and spigot is placed an adjustable shield which controls the hydraulic so that it reacts with a uniform current against the mineral seeking egress through the spigot, effectually washing all the slime from the particles suitable for the jig. This process being repeated at each spigot as far as carried for the jigs, carries away the slime, leaving the jig-tails perfectly clear, while the tables reveal the fact that no sand suitable for jigging has been carried over. This is a very important part of slime treatment. These results are accomplished with from fifteen to twenty per cent less water, which very much facilitates the subsequent treatment of the slime. This separator was more fully described in a paper read before the Institute at its last meeting in Boston, by Prof. Robert H. Richards, of the Institute of Technology in Boston. The slimes of the Calumet and Hecla assay from 1.2 to 1.3 per cent, the tales of the Evans table going away at about .65 per cent—results that are very good, considering that no free copper is found in the tailings. No matter how finely subdivided these sands may be, the particles still contain a finer particle of copper.

Thanks are due to the Calumet and Hecla Mining Company, which has been so liberal in its search for the best appliances, and which has seconded the efforts of those out of whose research and experience these results have come.

Calico District.

The prospects of Calico mining district are growing brighter every day. We have kept our readers posted in regard to the individual progress of the various mines, and in this brief article will only refer to them in a general way. The appearance of the various levels in the Silver King is improving, and the value of the mine can be determined by its weekly bullion report of over $12,000. The lower tunnel of the Garfield is penetrating a large body of rich ore, and the mine is progressing close on the heels of the King, followed in the immediate rear by the Gobbler, with its treasures of chlorides and black metal. The Oriental is constantly sending ore to the mill, and has reached such a depth as to insure its being a permanent mine. The Bismarck is rolling out tons of ore of a fair grade at every blast. The Golconda, considering the amount of work done on it, is destined to rank among the principal mines of the camp. The Silver Odessa is awakening from its lethargy, and the pick and blast are opening up some rich deposits. The Mammoth, adjoining the Silver King, is reflecting some of the latter's silvery rays in its bullion yield, as well as the Oriental No. 2, adjoining the east end of the King of our mines, which is attracting considerable attention, owing to recent strikes, made at quite a depth in this mine, which has been lying idle so long. The other mines that are in operation are looking well, and the general outlook of the camp is such as to encourage everybody. We could enumerate a number of mines that will be in operation ere long, but will simply refer to the Burning Moscow, Red Jacket, Humbug, Exchequer, O. K., and Dragons. These mines stand as good a show to open up rich deposits as any in the camp, and most of them have already turned out considerable quantities of ore. There are many undeveloped claims in the camp that may yet prove to be permanent paying mines when they are properly opened up. Taking everything in consideration, the present and future outlook of Calico mines is very encouraging. Before the fires destroyed the business portion of the town, the business men had the fullest confidence in the stability of the camp. Even when their business places were in ashes their confidence was not shaken, for it was not long before as many buildings were erected as were destroyed by fire. The town is now looking substantial, lively and prosperous, and we can safely predict stirring times here this fall and winter. Calico's colors are not the kind that easily fade. *Calico Print.*

A Nickel Discovery.

It has long been known to intelligent prospectors in this section that nickel is associated with other metals in the metalliferous veins traversing the metamorphosed granite, quartz-diorite and slate belt (from three to seven miles in width) separating the quartz-porphyry that skirts the volcanic valley of Mono Lake from the hornblendic or syenitic granite constituting the summit of the Sierra Nevada chain, and extending from Green Creek, north of Castle Peak, to the North Fork of Rush Creek, south of Mount Lyell, a distance of twenty-five miles or more. Float rock carrying from eight and a half to nine and a quarter per cent of nickel, $15 to $18 per ton in silver, and a trace of gold, has been found in considerable quantities on Virginia Creek, near the base of Castle Peak, and it was probably the presence of a large percentage of nickel that prevented the successful working of the rich auriferous ores of the Dunderberg mine, at the northern base of that peak, years ago. In some places along the outcrop of the Sheepherder lode of the Great Sierra Company, on Tioga Hill, twelve miles further south, where the slate has displaced the granite of the summit and crossed diagonally over to the western slope, nickel is also found in considerable quantities, but the shaft sunk over the tunnel shows that it does not follow the vein down more than forty feet. An occasional trace of this metal is also found in the free-gold ores of this district. Andrew Thompson and John Hall have recently made a discovery on Iron (or White Wolf) Mountain, five miles south of Tioga Hill, which bids fair to prove the *veta madre* of nickel in this section. They sunk down in the solid vein about fifteen feet, and crosscut fourteen feet without finding any traces of either wall. The lode is on a gentle slope of a low slate mountain, the surface of which was polished by the glacier which moved northward from Mount Lyell and eroded the canyon or valley now occupied by the Dana Fork of the Tuolumne, but this surface has since weathered until it is covered with sufficient soil to support a heavy forest of pine, and hence the outlines of the lode can not be traced on the surface, but the indications are that it is sixty feet wide. So far as the vein has been opened, the ore appears to be of very uniform grade, except a few small streaks of barren quartz and an average sample sent to San Francisco for analysis gave a return of thirty-four per cent nickel, $17 per ton in silver, and a trace of gold. When run out by the recent storm, the owners were not aware of either the nature or the value of their discovery, as they did not get returns from the assayer until they came in, but were drilling away through the "iron" in search of silver.—*Homer Index.*

Perils and Pleasures of the Botanist

A reception tendered to the well-known botonists Prof. and Mrs. J. G. Lemmon, at the Harmon Seminary, on the evening of Oct. 16th, was a great success, and was highly enjoyed by all present. The large audience room of the Seminary was well filled, and the excellent addresses by Prof. and Mrs. Lemmon, with musical selection by several of the pupils of the institution, made the evening seem very short. The guests of the evening were in good heart and voice, and they talked in an informal manner of their botanical researches and the results thereof. They described the topography of Arizona, and the peculiar forms of vegetation met with, with an abundance of specimens, and with beautiful water-color sketches, made by Mrs. Lemmon, of various plants as they were found growing. Certainly all who heard went away with new ideas of the great wonderland to the southeast of us. The speakers carried their audience through the plains of mesquite and the almost impenetrable fastnesses of cacti, and showed them the most beautiful flowers and ferns, which they found growing in great abundance in certain situations. It was apparent that our botanists had reaped a perfect harvest of plants new to science, and thus have made most valuable contributions to our knowledge of the flora of the territory. The educational value of their addresses to the young ladies of the Seminary, and to their invited guests, it would be hard to overestimate, and we are glad to know, from the expressions of those who were present, that Prof. and Mrs. Lemmon won for themselves places of honor in the esteem of many, and that the appreciation of their brave and devoted work will be greatly extended by their appearance on the occasion we have described.

NEW ROCK DRILL.—The Nevada *Herald* says: One of the best inventions in the way of mining appliances that has ever been invented in this county is the rock drill patented by Messrs. George F. Emory and Charles Barlow, of this place. The machine can be run either by steam, compressed air, or water power. * * * Many improvements have been made in the Emory & Barlow drill since we last mentioned it in these columns. Two or three slight obstacles which presented themselves have been removed, and the little machine now works like a charm. The drill is struck by a regular sledge hammer, which is fitted upon an iron handle, the operation of the machine causing the hammer to hit the end of the drill with great force and rapidity. When running at full speed the hammer strikes 350 blows a minute. A chain belt fits over projections on the drill collar, and by its continuous motion causes the drill to turn slightly at each blow. The rock dust is washed from the drill hole by a small jet of water, which is kept running constantly while the drill is working. One horse-power will run the drill, and it can be successfully operated by a small water-wheel, with a pressure of 150 feet. Lawrence & Barlow, at their foundry on Sacramento street, near the depot, have one of the machines set up in the yard, against a large granite boulder, where interested persons can see the practical working of it. They use a small hurdy wheel to run it, getting water pressure by means of a steam pump.

NEW ALMADEN MINES.—The quicksilver mines at New Almaden are turning out large quantities of ore at the present time. Five hundred and fifteen men are kept fully occupied, working ten hours per day. The majority of them are Englishmen, and the balance are Mexicans and Chilenos, and a few Chinese. Miners are paid from $2 to $2.40, and surface men from $1.50 to $2 per day. Out of these wages single men have to pay 75 cents per day for board, and $3 to $6 per month for lodging. Married men have houses to live in, but have to pay rent. There is a Catholic and also a Methodist church on the hill, a handsome schoolhouse, and a commodious hall for amusements. Four shafts are worked, the lowest at a depth of 2,000 or 3,000 feet below the level of the sea; and there are estimated to be fifty miles of underground drifts, all well timbered and ventilated; and the system of water supply is most complete. This is conveyed from a neighboring mountain, by means of a 2½ inch pipe, at the rate of 30 gallons per minute.

MECHANICAL PROGRESS.

Metallic Cars.

Since the close of the Chicago Exposition, certain of our contempories have been blaming master car-builders for their conservatism or lack of enterprise in not having exhibited for public inspection cars made of iron or steel. The Master Car-Builders' Association also comes in for a share of reprehension in not urging forward with energy and zeal the change from wood to metal. The claim is advanced that iron or steel will be used in car construction at no distant day, even from the humble coal car to the luxurious drawing-room coach. When the interests or prejudices of people lead them to desire a change in any practice or principle, they do not generally search long before finding plausible reasons for demanding what will satisfy their wishes. The iron and steel advocates are at this time solicitous for the safety of passengers, and they can not perceive any means whereby travel can be rendered safe except by the employment of steel cars.

There are two sides to this question. Lumber dealers are probably interested in retaining the present practice, and it may be that those who take the lead in pressing upon railroad companies the desirability of abandoning wood as a building material may by self-interest be biased in favor of steel or iron. But if there is any class concerned in this matter which ought to be neutral, it is the master car-builders employed by the various railroad companies. Their interest is in the best, the s f st, and consequently the cheapest, material for cars, irrespective of whence it came and of what it may be composed. Nothing that has yet been accomplished by iron or steel in the way of car building indicates any superiority over wood or even paper for general utility; and we certainly think the Car-Builders' Association acted wisely in refraining from pledging their influence in favor of a change which is yet experimental. There will be nothing lost by waiting till investigation and experiment prove what is really most suitable as a substitute for wood when that material becomes so scarce that it can no longer be used economically in car construction.

Only in one respect can the friends of steel make a decided point for that material over wood, and that is, its immunity from taking fire in case of accident. We believe this danger from fire is exaggerated, for where the floors of a car are filled with a non-combustible substance, and safety stoves and lamps are used, the chances of a car taking fire are very remote. Metallic cars would not be absolutely free from this danger, as the lining would necessarily be of wood. As a car-building material, iron or steel has certain objectionable features which must not be overlooked. In summer, metallic cars would have a tendency to be intolerably hot, for no amount of non-conducting material could prevent the heat of the sheets from being conveyed inside the car. In winter, on the other hand, the temperature of the metal would always be lower than the air inside the car, and continual sweating would ensue, with all the discomforts of dampness and water-saturated lining. This condition of affairs would be calculated to reduce the life of a steel car considerably below the period usually calculated on. There is another objection to metallic cars, which will occur to any one who has traveled on an empty tender; that is, the noise produced by the vibration of the iron sheets. Means of deadening this discomforting sound could probably be devised, but years of patient labor and experiment to overcome this and other objectionable attributes are required before the metallic car can be considered ready to fulfill its promised mission of superseding the wooden car.

We do not believe that there will be any sudden revolution in car-building. As lumber becomes scarcer and more expensive, metal, and perhaps paper, may be worked in gradually, the tools and building appliances being changed by degrees to meet the new conditions. Iron and steel have already worked into favor for trucks, but the adoption of metal has been a slow process, every step being accomplished after experiments made to ascertain the best methods of using it. Iron or steel sills may be the next step in progress, and other parts will follow on the metallic base when that becomes the cheapest medium; but we do not anticipate seeing the body of passenger coaches made of a material which conducts heat and cold so readily as does iron or steel.—*National Car Builder.*

FORGING BY PRESSURE.—The Collins Company, Collinsville, Connecticut, make the adz-shaped heads of pickaxes by pressure instead of by percussion. A square bar of Norway iron, one and three-eighths inch diameter, is heated to a softening red-heat, placed between clamping jaws, forming a matrix of the shape and dimensions of the ax head; and a punch, propelled by an eccentric and lever, moves forward and forces the iron into the mold or matrix, the punch being the size and shape of the handle hole. The action of the punch, or movable die, is not rapid; no more so than the movement of ordinary punching presses or cutting shears for boiler plate: it is a pushing or pressing movement, and in no sense a blow. The effect, however, is to form from the inch and three-eighths bar a head two and a half inches deep, with a lozenge-shaped eye three by one and an eighth inch. The longitudinal fibers of the iron are not broken, but are bent so as to follow the contour of the projecting portion of the head. The advantages of this method, in this instance, are that no appreciable portion of the iron is wasted by forging down from a wide bar and punching the eye from the solid—a saving of labor, and a gain of strength by preserving the continuity of the fibers of the iron. There may be many other instances in which the forging by pressure would be preferable to forging by percussion. —*Scientific American.*

Vibration of Bridges.

At a recent meeting, in New York, of the American Society of Civil Engineers, a paper, by James L. Randolph, Chief Engineer of the Baltimore and Ohio railroad, upon "Vibration, or the Effect of Passing Trains on Iron Bridges, Masonry, and other Structures," was read. Mr. Randolph refers to the fact that double-track bridges are moved in the direction of passing trains, and are consequently twisted, and strains are produced not provided for. Also that cattle-stops and open culverts, where built of rubble-work, have the walls shaken to pieces by vibration.

The remedy he has supplied for these culverts and stops has been to build them of large stone, as nearly the same size as possible. The tall, thin bridge piers and abutments on which iron bridges rest, have their stones so much disarranged by vibration as to make it necessary to secure them with timber and iron straps. Iron bridges resting on stone pedestals vibrate in this manner, and receive a return blow from the vibration of the pedestal, particularly if the pedestal is a light structure; but, as the iron and the stone do not vibrate in the same period, there must be time when the result is a movement in the direction of the force. The effect of this vibration has been particularly noticeable at the Harper's Ferry bridge, where there was a movement of four inches in four years. After the insertion of planks between the stone and iron, this movement ceased. Where the masonry of piers has a platform of timber between its foundation and solid rock, no displacement of stone has been noticed. Mr. Randolph contends that a monolith would be the best support for structures subject to vibration caused by strains, but that a monolith of the specific gravity of granite would give a damaging return blow. Timber would answer the purpose, but it is perishable. The material which, in his opinion, is most serviceable is an artificial stone, which is about two-thirds the weight of granite, is compact, durable, and with very little elasticity.

A CONVENIENT BOILER TEST.—A correspondent of the *Mechanical Engineer* gives the following method of testing a boiler, which, though not novel, is good: Fill the boiler full of water until it stands over the safety-valve seat. Be sure the valve fits tight to its seat, and works free. Then calculate the area of the valve, weight it to raise at the pressure you wish to test, and start a moderate fire under the boiler; the expansion of the water will raise the valve when the pressure reaches the test point; that is, if the boiler will stand it. If it will not, it will give way slightly in the weakest place, without doing any further damage; for if the test is properly done, the water will not be near the boiling point. To set the valve to test, say at 200 pounds per square inch, proceed as follows: Length of lever is 21 inches, distance of valve from fulcrum 3 inches, area of valve 4.9 inches. Then $21 \div 3 = 7$, $200 \times 4.9 = 980$, and $980 \div 7 = 140$ pounds, to be placed on the end of lever. From this, however, the weight of lever, valve and stem should be subtracted.

BOILER EXPLOSIONS.—Several of our exchanges have been enlightening an ignorant world concerning the cause of boiler explosions. One journal asserts that one of the most common causes of explosions is the practice of blowing out a boiler and then refilling it with cold water while the sheets and surrounding brickwork are very hot. That a boiler may explode from this cause, we will not deny, but that it is one of the most common causes of explosions, borders closely on exaggeration. We are more inclined to believe that the majority of boiler explosions are caused by carelessness, allowing the water to get low, and generating a pressure too great for boiler rivets to stand. There are so many ways by which an insufficient water supply may be caused, that we do not care to discuss them here.—*Wood Worker.*

DIFFERENCE IN DIAMETER OF HOT AND COLD CYLINDERS.—No mention has ever been made, says an exchange, of the difference in diameter between the cylinder of a steam engine hot and the same when cold. In small engines this change of dimension would not be great, but in large ones, and with the high pressures now carried, it can not be ignored. A cylinder 72 inches in diameter has 4,072 square inches area. Supposing it to expand only one-eighth of an inch, which is quite within bounds, it is then 4,085 inches in area, or 13 square inches larger. When this is converted into foot-pounds and pressures, it represents an item of no small importance. Since all calculations are made upon the basis of the board diameter, it follows that it can not be correct, and that the power is greater by the amount of the relative expansions in the cylinder diameter at extremes of temperature. A thorough study of the matter would be of great interest, and there is no doubt great truth in the remarks.

SCIENTIFIC PROGRESS.

Electricity on Railways.

One of the chief problems on which the inventive genius of the world is now expending its resources is the application of electricity to railroad transportation. For forty years experiments have been conducted with electric motors of all shapes, sizes and degrees of complexity; and there is now an excellent prospect for the substitution of electricity for steam on railways where either a low or high rate of motion is required. As many as 150 miles of electric railway are in operation in Europe; electric cars have recently made the circuit of Paris; an engine designed by an electrician to take the place of the ordinary locomotive was the most conspicuous triumph of American inventive skill at the Railway Exposition in Chicago not long ago; and in the vicinity of New York active preparations are making by rival inventors and corporations to introduce electricity on a large scale as a safe, rapid and cheap motor.

The electric car which recently traversed the streets of the French capital covered a distance of thirty miles in three hours. It was an ordinary street car, running in the regular tramways. The power was stored in Faure accumulators, placed under the seats, and was communicated to a Siemens machine, under the floor. This machine, making 2,200 revolutions a minute, brought the power to bear upon the wheels by means of pulley, axle and chains. The car was completely under the operator's control, and could be stopped instantaneously. The highest velocity attained did not exceed ten miles an hour on level ground, but the inventor contended that a much greater rate of speed could be obtained on rails especially adapted to the car. The cost of operating the motor was estimated at one-half that of ordinary horse cars.

The Siemens electric railway system in Berlin was operated on a different principle. The electric current was communicated from the rails to the motor. The rails were insulated, and the use of a wire was required overhead.

The new electric railway recently opened on the Irish coast, between Portrush and the Giant's Causeway, is a marked improvement upon the Berlin experiment. This system brings into use a separate conducting rail, carried at a height of seventeen inches from the ground, on wooden posts. The railway is operated at a decreased cost in comparison with steam, and a fair rate of speed is easily secured.

Experiments made a few weeks ago, however, with the Daft electric motor, in Greenville, N. J., give promise of greater results in the future. The electric current is transmitted to the rails from stationary engines, as in the case of the Berlin railway, but is so low in tension that there is no danger from contact either to man or beast. It is not even necessary to insulate the rails. The current is communicated from the wheels to the machinery which operates the motor, and notwithstanding the lack of insulation, a high rate of speed is practicable. If the statements in regard to the velocity, cost of working and general utility of these motors are confirmed by practical experience, a great revolution in railway transportation and steam-car traffic can not long be deferred.—*N. Y. Tribune.*

Problem of the Universe.

If asked, says Professor Tyndall, whether science has solved or is in our day likely to solve the problem of the universe, I must shake my head in doubt. Behind, above and around us the real mystery of the universe lies unsolved, and as far as we are concerned, is incapable of solution. The problem of the connection of the body and the soul is as insoluble in its modern form as it was in the pre-scientific ages. There ought to be a clear distinction made between science in the state of hypothesis and science in the state of fact; and inasmuch as it is still in its hypothetical stage, the ban of exclusion ought to fall upon the theory of evolution.

Professor C. A. Young, while speaking upon the same problem, in a late astronomic lecture, said: "Do not understand me at all as saying there is no mystery about the planets' motion. There is just one single mystery—gravitation: and it is a very profound one. How it is that an atom of matter can attract another atom, no matter how great the disturbance, no matter what intervening substance there may be; how it will act upon it, or at least behave as if it acted upon it, I do not know, I can not tell. Whether they are pushed together by means of an intervening ether, or what is the action, I can not understand. It stands with me along with the fact that when I will my arm to rise it rises. It is inscrutable. All the explanations that have been given of it seems to me merely to darken counsel with words and no understanding. They do not remove the difficulty at all. If I were to say what I really believe, it would be that the motion of the spheres of the material universe stand in some such relation to Him in whom all things exist, the ever present and omnipotent God, as the motions of my body do to my will—I do not know how, and never expect to know."

Rapidity of Cerebral Acts.

M. Albert Rene has, according to the *Revue Scientifique*, made a long series of experiments in the physiological laboratory of the Faculty of Medicine at Nancy, on the rapidity of transmission of impulses through nerves, and the rapidity with which cerebral acts are performed. He finds that the intensity of the stimulus has a direct influence on the rapidity of nervous transmission. The stronger the stimulus the more rapid the transmission. The rate of transmission can not therefore be stated in exact terms, since it is relative, as has been not unfrequently noted for other kinds of cellular activity. He has also confirmed the fact, now very generally admitted, that it is impossible to measure the rapidity of transmission in sensory nerves by stimulating different points of their length, for the rapidity of the response is not proportionate to the length of the nerve traversed. Thus the response to a stimulus applied to the fingers is often made with a shorter interval of time than a stimulus applied to the elbow or to the shoulder, though the length of nerve called into play is much greater in one place than in the other. In a word, it is impossible to compare the results obtained from different regions. The most exact method of measuring the nervous transmission appears to be that of response to an auditory stimulus. The rapidity with which nervous impulses are here conducted he estimates at 28 meters per second, which is a little lower than the number obtained by other physiologists. For the rapidity of transmission of motor impulses, M. Rene gives 20 meters per second, which is below that of experimenters, and notably below that of M. Chauveau. The duration of a cerebral act he estimates at .035 second. In young infants the duration is more considerable, amounting to .09 second. The duration of a reflex act, that is to say, the time occupied by the entire reflex arc, sensation, transmission to the cord, including motor impulse and muscular movement, is .15 second.

CONVERSION OF LIGHT INTO ELECTRICITY.—The production of light from electricity is so well known that it may have seemed singular that light would not generate electricity. The latter has actually been accomplished by Sauer, who has constructed a battery that acts only in sunlight. In this case it is the chemical constituent of the light that furnishes the power. Heat rays acting upon a thermo pile also produce a current. Sauer's battery consists of a glass vessel containing a solution of 15 parts of table salt and 7 parts of sulphate of copper in 106 parts of water. Within is a porous cell containing mercury. One electrode is made of platinum, and is put in the mercury; the other is of sulphide of silver, and is placed in the salt solution. Both are connected with a galvanometer, and the whole is inclosed in a box, when not in use. When the battery is placed in the sunlight, the galvanometer needle is deflected to a certain point, and the sulphide of silver is found to be the negative pole. Any change in the intensity of the light, such as a cloud over the sun, is indicated by the needle. The action of the battery depends upon the effect of the chloride of copper upon the mercury. Subchloride is formed, and reduces the sulphide of silver, but this can only take place with the aid of sunlight. Hitherto the only manner in which light seemed to affect electrical action was by increasing the resistance of a selenium cell, and all photo-electrical experiments were based on this phenomenon.

VITALITY OF DRIED WILLOW GERMS.—A correspondent of the *Scientific American* furnishes that journal with the following: During the summer of 1853, Silvester Piper, now a resident of 3526 Jones street, Chicago, called my attention to a willow basket, in a ditch, which had sprouts several inches in length all around it. A curiosity so remarkable—possibly having no parallel—led me to take immediate steps for its preservation. I dug the basket up with the greatest care, and found it to be a worn-out castaway, which had done service as a basket until it had become so badly worn as to render it worthless, when it found its way into a ditch at the base of the bank of the Illinois and Michigan canal, about 300 feet from the Bridgeport lock (now within the city), from whence I transplanted it with great care, placing it in a wet place in my father's garden; but, notwithstanding its former vitality and careful removal, the shock was too great for the tender shoots, and they all died. The basket was made wholly or in part of unpeeled willow, whose dried and withered germs needed only the opportunity to return to life. I have often resolved to have the story of the 'willow basket' written and placed upon record, while there were still living other witnesses than myself to verify it.

SOLIDIFIED BISULPHIDE OF CARBON.—According to M. Mercier, by mixing boiled linseed oil with 10 per cent of protochloride of sulphur, a gelatinous mass is formed, and if a large quantity of bisulphide of carbon be simultaneously added, the whole sets into an elastic transparent jelly, very permanent in the air, and inflammable only with difficulty, although it may contain as much as 70 per cent of the bisulphide.

Bullion Shipments.

Mt. Diablo, Oct. 18th, $10,697; Hanauer, 16th, $5,000; Ontario, 16th, $15,328; Bullionville, 16th, $2,240; Horn Silver, 16th, $21,000; Horn Silver, 17th, $4,000; Bullionville, 17th, $2,277; Alice, 17th, $11,212; Hanauer, 18th, $10,200; Crescent, 18th, $2,100; Ontario, 18th, $10,708; Horn Silver, 18th, $12,000; Stormont, 19th, $2,990; Hanauer, 19th, $3,620; Ontario, 19th, $5,267; Horn Silver, 19th, $12,000; Ontario, 20th, $4,968; Ontario, 21st, $7,767; Horn Silver, 21st, $12,000; Contention Con., 20th, $16,206. During the week ending Saturday, October 20th, there was shipped from Salt Lake 47 cars of bullion, 1,200,983 pounds; one car antimony ore, 20,000 pounds; one car lead pipe, 30,445 pounds; 2,040 pounds granulated lead; making a grand total of 59 cars, aggregating 1,563,558 pounds.

Our Patent Department.

The MINING AND SCIENTIFIC PRESS Patent Ageney of Dewey & Co. is not oniy the oldest established one on this coast, bnt the most extensive in every respect. The managers have had an experienee of over 20 years in obtaining United States and foreign patents for Pacific Coast inventors, for whom some thousands of patents have been taken out. The large library of Patent Office reports is supplemented by a good one of other works useful to nventors; and in addition there are full and complete specifications and drawings of every patent taken out in the United States since 1871. The clientage of this patent ageney embraces all the most prominent inventors on the coast, who appreciate its advantages for prompt and intelligent work, and honorable, fair dealing.

As this patent ageney has been in existence so many years, it has among its archives a great mass of information, which is utilized for the benefit of its patrons. In certain branches, particularly, the information we possess is very valnable to inventors, notably in mining machinery, metallurgical applianees, cable railroad apparatus, agricultural machinery, etc. With experienced draftsmen and specification writers, we are enabled to transact the business of inventors with intelligent skill, and greatly to their advantage. This patent agency is in no manner connected with the sale of patents or patent articles, being thereby entirely free to give faithful and unbiased services to its elients.

Mining Share Market.

No unusual activity has been shown of late, except in Ophir and Hale and Norcross. The former was due to a contest for control. In the Hale and Norcross great improvement has been shown on the north drift on the 2700 level. The quartz is the best yet found. Interspersed through it are small, irregular lumps or pebbles of porphyry. These are the same as have heretofore been seen in all the Comstock ore bodies. In the California and Consolidated Virginia bonanza these lumps of porphyry ranged in size from the diameter of peas to bowlders several hundred pounds in weight. The quartz now found is very different in appearance from that seen in the stringers and feeders heretofore met with. It shows strength and indicates bulk. In this quartz spots of black sulphuret ore are beginning to make their appearance. Just how wide the vein of quartz is remains to be ascertained.

On the 3000 level of the Union Consolidated they have discontinued work for a time in the west cross-cut, and are now driving a cross-cut east into ground thus far wholly unexplored.

At the Ophir they are finding some old fillings on the 150 level which will pay for milling, but not much of value has yet been found in the new ground. The level has heretofore been pretty thoroughly explored, it would seem, at various times.

At the Imperial the 600 station is completed, and they are now preparing to start a drift west to tap the old upper levels.

Although considerable work is being done in the Gold Hill mines, the extraction of ore can not be fully resumed till the mills start up.

In case no accident shall occur, the Alta mine will now soon be drained, when work on the lower levels may be fully resumed.

REMEMBER, if you want health and strength of mind and muscle, use Brown's Iron Bitters.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

VOLCANO.—Cor. *Dispatch*, Oct. 20: The Downs mine is running by day in the old shafts, retimbering and taking out rock until they can get water enough to start the mill. The Canvin mine is looking well. They are taking very rich rock out, and have plenty of it in sight. The ledge is 4 ft wide and averages $25 to the ton. They have finished running levels. There is about 75 tons on the dump ready for crushing. We have been to see Gillick & Phillip's mine. We found the gentlemen getting out rich rock. The ledge is 4 ft wide. The have it stripped for 75 ft, ready for stoping, and have about 70 tons at the mill ready for crushing when the rain comes. J. E. Doolittle, Supt. for the Tunnel Co., has completed the new flumes and wing-dams, and is now prepared for rains.

PLYMOUTH.—The mines here never paid any better than at present. The water will be brought to the Empire mill with several hundred feet more fall, and the mill will hum away with her 80 stamps every month in the year.

NOTES.—*Ledger*, Oct. 20: The big tunnel at Middle Bar is in about 100 ft. They are now in softer rock, and progress will be more rapid if the water supply holds out. It is expected that the water will be turned into the new pipe across Jackson Creek next Saturday. The Loyal Lead mine is said to be turning out well under the management of John Palmer and his co-owners.

Calaveras.

GOLD CLIFF MINE.—Sonora *Democrat*, Oct. 20: Some most remarkable results in mining are being achieved at the Gold Cliff mine, at Angels camp, Calaveras County. The mine is on what is generally known as the "mother vein," but the lead itself is not worked. It is from a belt of slate running parallel with the lode that the gold comes. At the Gold Cliff this belt is over 100 ft wide. Every thing within this distance is taken out and run through the mill. The rock is simply quarried out from the surface along the hillside. The gold is all sulphuret gold, and is very fine. All along the surface and for some depth below the surface the sulphurets are oxidized and decomposed, which renders the gold easily saved. One hundred tons of ore, if the stuff can be called ore, is put through a 20-stamp mill every 24 hours. Although the power used is steam, the total cost of mining and milling is only one dollar per ton. Mr. Goldstone, the Supt., informed the *Democrat* that the mine pays regular dividends.

El Dorado.

GREENWOOD.—Cor. Placerville *Democrat*, Oct. 20: Mr. A. J. Morrell has recommenced work on the Morrell Con., having run a tunnel to tap the ledge at a distance of 50 ft below the golden discovery recently made. The work will be completed at an early date. The ledge matter at the present working is 2 ft thick, and is very rich. This pay vein has been followed to a depth of 40 ft. It has invariably paid for working by a hand mortar, never paying less than $4 a day to the hand. The upper tunnel, in which the last work was done before the sale, having caved in, it became necessary either to run a new tunnel or put in a good pump. The owners, now feeling able to make so much of an outlay, sold it to Mr. Morrell.

SPRINGFIELD.—The Springfield mine is running with a full force, and work was resumed on the new shaft Tuesday. The new machinery is first-class. Everything about it works like clock-work. The hoisting machinery being erected on the Lamoille mine is nearing completion, and Supt. Long informs me that every thing will be in running order in a few days.

STRUCK IT.—On Thursday last Fred Benfeldt struck a fine bed of gravel in his mine near Smith's Flat. It was only last Saturday that Fred expressed himself as discouraged. During the cold weather last winter the mine was shut down and allowed to fill with water. This caused numerous caves, and it has taken constant work during the entire summer to repair damages.

THE GRAND VICTORY MINE.—C. A. D. Gray, Supt. of this mine, near Diamond Springs, was in Placerville Thursday. Mr. Gray informs us that he is keeping 35 of the 50 stamps in his mill at work right along on good ore, and that by the first of next month he will start up the other 15.

THAT PULVERIZER.—Georgetown *Gazette*, Oct. 19: The Tasker pulverizer which has been on trial at the Eureka mine in this place for the past month has been condemned. It is of no practical use. It has been faithfully tried. When one difficulty could be overcome others would follow. The balls wore uneven; too much time was wasted in the tedious work of opening and closing the mill for changing the ball and tightening the same; the screens broke too often; the concentrators could not be made to save half the sulphurets, and what they did save were two-thirds sand.

Inyo.

ELNA.—*Independent*, Oct. 20: The machinery is being put in place, and by November 1st the furnace will be ready to fire up. Wood and coal are being delivered in quantities sufficient to warrant a steady run when once smelting begins. The plant will constitute one of the finest smelting works of its size on the Pacific Slope. A large, finely appointed, and complete sampling room is connected, also an assay office.

A NEW MILL.—Chrysopolis will soon have a five-stamp mill. A company composed of New York men owns a group of mines which contain free-gold rock. S. S. Barrie is here representing the company. He expected to break ground this week.

AT REILLY.—The following, relative to the Argus Range S. M. Co.'s operations at Reilly, is reliable. The mill was run 4 days last week, during which time 30 tons of ore were worked. The clean-up produced 137 ounces of bullion .928 fine, worth about $2,200. The mill is not shut down for want of water.

THE MODOC.—Through a private letter we learn that Supt. Fitzgerald started up his furnace at 5.30 P. M. Oct 13, and up to date (17th) had beaten all previous records of output since F. H. Selby's run in May, 1877, making 4 tons of rich bullion per day.

Mariposa.

MARIPOSA IMPROVEMENT CO.—*Herald*, Oct. 19: The following is an extract from the prospectus: "The Mariposa Improvement Co. is organized under the laws of California; and the design is to work on a system that will enable them to handle a large amount of ore at the minimum cost. They propose to build a plant at the mouth of Cotton Creek, on the Merced River, that will be run by water, and handle from 200 to 400 tons per day. The system of narrow-gauge railroad that they propose to put in is not to carry the ore from one mine, but from a large section of country. They have mines enough already opened to supply ore for years."

Nevada.

IMPERIAL.—Grass Valley *Tidings*, Oct. 18: The Imperial Co: are pushing the changes in their machinery rapidly. The engine formerly used for hoisting will be used for pumping. A 6 horse-power engine with friction gear will be used for hoisting. A 6-in pump will, with the rest of the machinery, be ready to be taken to the mine by Saturday. The lumber is on the ground, and it is expected that every thing will be ready to turn on steam by the 27th of this month.

IRONCLAD—*Transcript*, Oct. 20: Arrangements have been made by which eastern parties, represented by Brand Bros., of this city, will to-day recommenee work on the Ironclad quartz mine in Rough and Ready township, which has been idle for more than a year past. The property was until yesterday owned and controlled by Wm. Cammet and others, who put up fine hoisting works and a five-stamp mill, sunk a shaft to a depth of 235 ft, run two levels, and found good ore, but their facilities were not such as would reduce tellurium, which it was.

Plumas.

YANKEE HILL.—Cor. Oroville *Mercury*, Oct. 19: There is more good milling ore in this belt of country between the north fork and west branch of Feather River than any other portion of the state I have visited. It is reported here that a mine known as the Durett & McConnell mine, half a mile from Yankee Hill, has been sold to capitalists. There is also a rumor that they have struck a large vein of gold-bearing quartz in the Big Bend tunnel. If this is true it demonstrates what has been in doubt in regard to the veins holding to any depth, as the tunnel must be at least 1,000 ft below the surface.

RICH GULCH QUARTZ.—Quincy *National*, Oct. 20: Hallsted & Co. are running a prospecting tunnel to the ledge, which will tap it 200 ft deeper than the present workings, and it is expected that the tunnel will strike the ledge in a few days. This will prove that they have a valuable mine, and will make them independent.

LIGHT'S CANYON.—Prospect work on Major Whitlock's silver mine in Light's Canyon is being pushed steadily, and the ore is looking first-rate. Plumas will have a paying silver mine yet.

GREEN MOUNTAIN.—Greenville *Bulletin*, Oct. 17: The boiler has been moved from the Cherokee mine to Green Mountain, to furnish power for the air compressor should the water in the reservoir be exhausted. This will insure the continuance of work in the main tunnel in any event.

THE GARFIELD MINE.—This mine is under the complete control of W. J. Reynolds. On Monday he put men to work and will get the mine in complete working order. All the indications are very encouraging.

GOLD STRIPE MINE.—All outside work is suspended for the present at the Gold Stripe. Supt. Standart says he will keep 6 miners at work all winter prospecting.

Sierra.

SLUG CANYON.—Downieville *Messenger*, Oct. 20: D. R. McKillican, of North Bloomfield, was in this section last Monday, on a tour of inspection. Tuesday he went to Jerome York's quartz mine, in Slug Canyon. This is one of the most promising properties in this section. It has not been extensively developed as yet. The ledge varies in width from 2 ft upward. It has been uncovered in three places, and each opening shows fine ore. A substantial arastra has been erected, and was profitably run while the water season lasted last spring. The mine is 1½ miles from the river, and 800 ft above it.

Tuolumne.

LAMPHIER.—Sonora *Democrat*, Oct. 20: The developments in the Lamphier mine continue encouraging. The north drift is in about 50 ft, with a vein of splendid quartz over 3 ft wide in the face. In the south drift, which is in nearly 70 ft, the ledge continues large and very rich. The prospecting mill will be ready for crushing in about 15 days.

PAMPA HILL.—The gentlemen who own the Stockton mine have recently purchased the Pampa Hill mine near Rawhide, and have commenced to develop it. The showing so far is very good, and some fine rock is being taken out.

NEVADA.

Washoe District.

HALE AND NORCROSS.—Virginia *Enterprise*, Oct. 20: On the 2700 level the north drift, now running westward, is cutting quartz of favorable appearance. The south drift on this level was turned and driven some distance west. From it a drift has been started south on a streak of clay and quartz which promises well.

UNION CON.—On the 3000 level the west cross-cut has been discontinued for the present, and a cross-cut started east to explore. At the 3100 level preparations are making for opening a working station 12x18 ft in size and 12 ft in height.

MEXICAN.—The connection has been completed between the raise from the 2900 level and the winze down from the 2700. Workmen are now enlarging and timbering up the connection. The main north drift on the 3100 level is pushed at the rate of 30 ft per week.

SIERRA NEVADA.—North lateral drift No. 1, on the 2900 level, is being pushed at the rate of 30 ft per week. A raise will soon be started from this drift to connect with the winze down from the 2700 level.

YELLOW JACKET.—Good progress is being made in introducing steam power in the Brunswick mill, and soon the work of extracting ore may be resumed.

GOULD AND CURRY.—On the north line a station

is being cut out in east cross-cut No. 1, on the 2500 level, for a winze joint with Best and Belcher.

OPHIR.—The exploring drifts on the 150 level have found some old fillings that will pay for working, but thus far nothing of value has been found in new ground. Ore is again being extracted from the croppings.

ALTA.—The water will soon be out all the way to the bottom of the mine at the 2150 level, when active prospecting may again be resumed. The machinery is working well.

BEST AND BELCHER.—Are cutting out a station in the joint winze in east cross-cut No. 1, on the 2500 level, at the south line. The flow of water from the north drifts in as strong as ever.

ANDES.—Are still finding some paying ore in north drift, and the drifts from the bottom of the winze are showing quartz of a good appearance.

CROWN POINT.—Work is gradually being resumed in the lower levels. As soon as the mills can crush the ore a full force of miners will be put to work.

BELCHER.—Are preparing for the extraction of ore, which will be fully resumed as soon as the mills on the river are in full operation.

SCORPION.—The west drift on the 500 level is passing through vein porphyry, showing occasional streaks of quartz and seams of clay.

IMPERIAL.—The station at the 600 level was completed yesterday, and a drift will now be started west to the old upper levels.

UTAH.—Good headway is being made in the north drift on the 1350 level, in material of a favorable character.

SAVAGE.—The explorations near the south line have shown up a large body of quartz giving low assays.

CALIFORNIA.—Joint Con. Virginia winze No. 2 is being sunk at the rate of from 12 to 15 ft per week.

CONFINATION SHAFT.—Will soon be ready to receive and set up the machinery of the new hydraulic pump.

CON. VIRGINIA.—Joint California winze No. 2 is being sunk at the rate of about 15 ft per week.

OVERMAN.—Some ore that will pay for working is being found on the old levels.

UNION SHAFT.—Are still casings timbers and repairing the station at the 2300 level.

Belmont District.

SEVENTY-SEVEN.—*Courier*, Oct. 13: Green Aldrich has had two men employed for the past few weeks in exploring the Seventy-seven mine, north of town. On Tuesday last, they struck a large pocket of ore, which assays way up in the hundreds.

BELMONT.—The work of development progresses satisfactorily in the Belmont mine. Rich chloride and black metal ore is extracted daily. The leaching works are almost completed and the mill will soon be ready to start up. The following is a copy of Superintendent's letter of October 13: The Laity ground shaft No. 1 is 115 ft in depth, from which we are starting a drift to the north, in good ore. All stopes are producing good ore. During the week, level No. 1 has exposed splendid ore in the south end. South tunnel stope showing fine ore, in which we are preparing room for more men. Mill construction is nearly completed. We are hauling ore to the mill.

Candelaria District.

NORTHERN BELLE.—*True Fissure* Oct. 20: The drift under the hanging wall on the tenth level looks very encouraging, and shows a foot of ore giving very good assays. The seventh and ninth levels are turning out a limited quantity of fair ore. The new development above the seventh level looks well as far as opened, and a small addition to the surplus of ore is being made. Both mills are running as usual, five of the stamps of mill No. 2 being engaged on crushing ore from the Great Western mine in Garfield district. A shipment of bullion amounting to $6,658.86 was made last Monday.

MOUNT DIABLO.—The drift below lower winze No. 2 shows a strong ledge, which is turning out some $45 quartz. The stope from this winze is yielding considerable $55 ore. The stope below the third level, and near winze No. 1, shows a strong ledge of $50 ore. A shipment of bullion valued at $10,697.12 was made on the 15th instant.

COLUMBUS CON.—The drift from cross-cut No. 1 was advanced about 12 ft during the week, making a total length of about 23 ft. The streak of ore has continued all its length, and gives good assays all the way. The drift running west from the bottom of the Bonanza winze has attained a length of 22 ft. The drift running east is now 12 ft in length, and is showing more encouraging prospects.

Esmeralda District.

WASSON CON.—*Herald*, Oct. 20: Some 9 miles southeast of New Boston, and in Santa Fe district, are the company's mines. The Lucky Baldwin was the first inspected. It is 1500 by 600 ft, and several drifts have been run on the vein, opening up large bodies of high-grade ore. During last spring some 300 tons of ore milled a trifle over $84 per ton. The ore requires roasting, but it is not very refractory. The ore closely resembles that of the Northern Belle, being a soft chloride, and easily crushed. The Comstock mine lies one mile northeast, and has a perpendicular shaft 60 ft, all in ore. A level has been run from the bottom of the shaft, opening up an extensive body of very rich ore that displays horn silver and chlorides. The Belleville mine has cuts, drifts and inclines run upon it, opening up fine bodies of high-grade. The Cotbridge has an open cut upon the ledge 75 ft, that has stripped the ledge, exposing a fine body of soft, decomposed quartz, rich in silver.

MOUNT CORY.—Car-loads of material and machinery continue to arrive. The boilers are in place, the engine beds laid, and the greatest activity in apparent. Those who have seen the large mills of other mining localities will be surprised when they view and inspect this one. Coryville is situated in the canyon, about half a mile from the Mount Cory mine. New houses are in course of construction. Parties with ample capital will soon take charge of the Crossman mine, and unless signs are at fault, this district will, by another year, be the bullion producer of Nevada.

Paradise District.

WILD GOOSE.—Reno *Journal*, Oct. 20: "Big Nick" Freyer is in Winnemucca from the Paradise mines, and gives glowing accounts of their appearance, especially the Wild Goose. He says they have an immense body of ore extending from surface to the lowest depth yet attained—about 175 ft. On the Live Yankee they have run a drift and upraise for ventilation, and are now preparing to run on the level and take out ore.

Pioche District.

EL DORADO CANYON. *Record*, Oct. 13. The Southwestern Co. are working a larger force than has been worked for years. The Techatticup mine is yielding the precious metal by tons daily. Some 23 men are employed at the mine. The mill, which is a 15-stamper, is kept running night and day; and as the mill is new, it is rare that a break occurs. The stream of bullion it has turned out since it started up is enormous. The mine keeps ahead of the mill about 500 tons, which shows that the ore supply at the mine is good.

NOTES.—Partridge, McGregor & Co. have a fine piece of mining property known as the Flagstaff. The ore is shipped to San Francisco, where it is disposed of at $400 per ton. Jim Cronin is preparing to start up on his mines again. When both mills are running at the canyon and the chloriders get their ore crushed, it makes times lively. Fred Nickle & Co. have been shipping some very rich ore to San Francisco, that was sold for $1,600 per ton.

Pyramid District.

PYRAMID MINE. Reno *Journal*, Oct. 20: C. Derby and Alvaro Evans came in from Pyramid yesterday. They say the ledge has been struck and passed through, and is between 30 and 40 ft in width. They brought in a lot of the rock, and it looks exactly like Comstock quartz, but the fear is that it will only assay from $12 to $25. An upraise has been started for the bottom of the shaft 172 ft. To make the upraise will take about 20 days. This will give ventilation, and lead to the ore known to exist at the 400-foot level.

Tuscarora District.

GRAND PRIZE.—*Times Review*, Oct. 14: The west drift in the 200-foot level is in 69 ft. The drift is being timbered. As soon as it is completed, stoping above it will be commenced. Have commenced stoping above the 300-foot level; stopes producing good ore. West drift on the 400-foot level is in 74 ft. Have cut through the cross-cut and will be to the ledge in a few ft. The *Times Review* of the 19th says: The Grand Prize mill will start up on the fifth of next month on ore from between the 200 and 300-foot levels. The stope opened out at the 300 is 100 ft in length, and car samples during the last week averaged $200 per ton. There is every indication that the mill will have an unusually successful run.

INDEPENDENCE.—North drift, 300-foot level, has attained a length of 860 ft; progress for the week, 15 ft. West cross-cut, 300-foot level, to connect with raise from 400-foot level, is out 34 ft; progress, 23 ft. The flow of water on the 500-foot level has decreased one-half during the week.

BELLE ISLE AND NAVAJO.—Work is progressing as usual.

ARGENTA.—North cross-cut on the 400-foot level is in 141 ft; progress for the week, 13 ft. Face of cross-cut is in favorable formation.

NORTH BELLE ISLE.—During the week have been timbering south drift, 300-foot level. The stopes on the 70-foot level are producing the usual ore.

ELKO CON.—Since last report, shaft No. 2 has been extended 15 ft. Total depth, 170 ft. There has been a favorable change in the formation, it now being porphyritic and carrying small stringers of ore.

ARIZONA.

PECK DISTRICT.—*Courier*, Oct. 13: The Black Warrior mine is now considered one of the best mines in the territory. The vein is large and rich. Twenty-five men are employed in the mine and ten at the mill, which latter institution has four stamps, capable of pulverizing 5½ tons of ore every 24 hours. Silver bar, No. 37, worth $1,000, was on Friday shipped East. From October 1st to the 9th, six bars of fine bullion were shipped. The mill has been running but a short time, and yet $40,000 have been taken out and shipped to the owners in New York.

HOWELL'S.—The Howell Co.'s mill is running on Belle gold ore. The result of the last run on silver, was eight bars of bullion, which have been shipped East. Two Cornish rolls are on the way, and will be added to the mill.

CLIP MINE.—*Sentinel*, Oct. 13: On the whole, the Clip mine has made a magnificent showing. With a ten-stamp mill, this property has yielded in six months time, including stoppages for repairs, $80,000. Silver district has made a record.

PINE SPRING.—*Miner*, Oct. 12: The Gavin mine is down 102 ft. They are drifting south on the 72-foot level in a large and well defined body of native silver ore.

CASH ENTRY.—Rodenburg and Shaw are down 50 ft in good ore, consisting of chlorides and sulphides. Work is progressing with all the force that can be employed to advantage. Yankee Boy is down 30 ft in good ore, principally chlorides, free-milling, which is being taken out as fast as the force at hand will allow. In the None Such, they are taking out good ore. They are down 187 ft, and are drifting north.

A RICH FIND.—Tombstone *Epitaph*, Oct. 12: A Mexican gentleman named Jose Salazar, who lives on a ranch twenty miles south of Tucson, created considerable excitement among old settlers when he came in Wednesday and recorded a notice of the location of the Tumacacori mine, and exhibited some of the ore. The mine is located one mile east of the ruins of the old Tumacacori Mission, and three miles from the ancient town of Tubac. The mine was worked by the Jesuits more than a hundred years ago, and the records say it contained untold thousands of dollars in rich silver ore. But years of neglect removed the old landmarks until its exact location was lost sight of. Although immense sums of money had been spent during the past twenty years by parties searching for it, its location never could be found until Senor Salazar accidentally stumbled upon it. He brought in some samples of rock yesterday which show native silver in great abundance.

GIRARD.—Work on the 200, 300, and 350-foot levels continues. The ore in the latter has completely changed from a sulphuret to a carbonate. The Superintendent will commence shipments of high-grade carbonate ore to Benson to-morrow. Considering that the force of men worked in this mine is only a small one, numbering but 15, the ore output is remarkable.

MUSIC MOUNTAIN.—Mineral Park *Miner*, Oct. 8: The mines in Music Mountain are looking splendidly, and large quantities of high-grade gold ore are being taken out. The only drawback to the profitable working of mines in that region is the scarcity of water for milling purposes. The ore is free-milling gold quartz, running from $40 to $500. Water costs the miners about 13 cents a gallon.

COLORADO.

ANOTHER RICH GOLD STRIKE.—The *Register-Call*, of Oct. 12, gives this item from the Pueblo *Chieftain*: News of another big gold strike is received, which promises next year to create a second Summitville. Mr. Stewart Maxwell arrived in this city yesterday from Del Norte, and will be followed to-day by his partner, Thornton Chase, formerly of Pueblo and later of Denver. These gentlemen have spent the whole season in prospecting for a continuation of the Summitville gold belt, remaining all summer in the heart of the San Juan Mountains, somewhere beyond Del Norte. Mr. Chase has been aware of a gold find made there years ago, the discover of which died before disclosing his secret. He was determined to put in a season searching for it, and it looks now as if the two are to be well rewarded. They had an assay made at Del Norte, which showed about $1,000 to the ton in gold. This created great excitement, and Senator Bowen now has men flying all over the country trying to find the place. Before they left they camped in three inches of snow, which will effectually conceal their discovery until next spring.

BLACK HAWK RETORTS.—Wayne Tucker, who has charge of the New York Co.'s 75-stamp mill in Black Hawk, brought up to the Rocky Mountain National Bank several gold retorts last evening, among which was one weighing 105 ounces, the yield of five cords of mill dirt treated from a mine near this city. This is an average of 21 ounces gold per cord. This is good enough for the oldest inhabitant.

SHIVELY.—Georgetown *Courier*, Oct. 11: John Frazier, who is leasing on the 255-foot level of the Shively, east of the main shaft, has from 1 to 2 inches of ore that will mill from 200 to 500 ounces per ton. Two miners took out over a ton last week. The 230-foot level is being driven east by Smith & Co. They have from 3 to 4 inches of gray copper and galena, the first-class of which runs from 300 to 800 ounces of silver per ton.

SUMMIT.—Excellent mineral is being taken out of the 170-foot level. One party took out 30 sacks of first-class in one week. The last mill run from this place returned 1440 ounces for first-class, and second-class, 328 ounces silver per ton. They have drifted 46 ft on the lower level, east and west, and found ore the whole distance.

IDAHO.

BAVARIAN.—Wood River *Times*, Oct. 10: Frank Phuntz & Co., the owners of the Bavarian, have sent five tons of ore to the Hailey sampling works, which carry an average of 90 ounces of silver and 75 per cent lead. The vein is two ft wide.

MULDOON.—The shutting down of the mine was entirely unexpected, even by Colonel Ballentine, the Supt. Only three men are now working. An extensive and rich ore body was struck in the mine just two weeks prior to shutting it down, so that there can be no doubt about work being resumed early in the spring.

SAWTOOTH.—Seven bars of bullion, aggregating 495 pounds in weight, and valued at $8,250, were received to-day from the Columbia and Beaver mill, at Sawtooth. This is the second shipment, the two aggregating about $14,000 since the starting up of the mill, or about $500 per day.

PIGTAIL DISTRICT.—Ketchum *Keystone*, Oct. 10: We learn from James Kellogg, just down from Pigtail mill, that the Fisher five-stamp gold mill has been running steadily for several weeks, and is consuming five tons daily. Duckdale & Sheron, the owners, have a small crew on the mine, which has so far yielded handsomely. They have laid in a large amount of winter supplies. The Fisher mine bears a gold quartz ledge of several feet, containing an ore vein of from 12 to 15 inches, that yields an average value in gold of from $100 to $140 per ton. The ore is very easy milled; the operation, though on a light scale, is the handsomest paying in the country. The capital invested is comparatively nothing, and the dividend is constant and good.

BALTIMORE GROUP BONDED.—The Baltimore group of claims, one mile east of the Elkhorn, owned by J. C. Cobaugh and Ed. Preston, has been bonded to James Hickey, of Salt Lake City, for $50,000. This property includes the Baltimore and Victoria mines, and is considered one of the best in the vicinity. There are 100 tons of ore on the dump, taken out in development work, and large bodies are uncovered, ready for stoping.

ELKHORN.—Eight additional miners have been put to work on the Elkhorn mine, making a total force of 38. We are informed that operations will be pushed for the next month or six weeks, at the end of which time the regular crew will be reduced one-half for the winter.

EXCELSIOR.—Challis *Messenger*, Oct. 9: Last Thursday an ore body was struck in the Excelsior, and the forces have been driving for over two days across the vein, and are unable yet to reach the opposite wall. Those who know, say that the ore bed looks better than in its best. Its output was over $40,000 last year.

VIENNA.—The Vienna Co. will employ 100 men about their mill and mines during the winter. The preparations for winter are complete.

NEW MEXICO.

OLD MAN.—Silver City *Enterprise*, Oct. 12: At the Old Man, operations are now confined to the driving of the cross-cut tunnel, and to the exploring of the vein from the bottom of the upper shaft. At one point in the bottom of the cut, there is a splendid showing of decomposed quartz, literally covered with scales of horn-silver, while the interstices of the rock are lined with the precious stuff. One large piece, weighing about 75 pounds, was estimated to contain silver at the rate of $10,000 per ton.

GOLDEN RULE.—The Golden Rule mill has increased the amount of ore treated to sixty tons per day. The ore treated averages from $20 to $30 per per ton, and in round figures it is safe to estimate each day's run at $1,500.

SHERMAN.—The Sherman mine was bonded yesterday to W. H. Newcomb to the 1st of January. Mr. Newcomb will immediately put a force of men to work and develop it. Williams Bros.' interest is bonded for $40,000.

LEGAL COIN.—A one-fourth interest has been purchased in the Legal Coin claim, at Fleming, by M. Germain, of J. C. Woodward. The claim is the one on which rich ore was discovered about two weeks ago.

THE NEW STRIKE.—The new strike made a short time since by Crowley, Christenson and Thayer has produced fifty sacks of ore thus far. It is exceedingly rich in chloride and sulphide of silver.

CARLISLE.—Deming *Tribune*, Oct. 11: Samples recently brought to the surface from a depth of 270 ft, assayed in silver $974.53; gold, $369.57; total, $1,344.10. Their mill is at a convenient distance. This property is owned by the Messrs. Farrish, Leach and others, in Cochise County.

BLACK RANGE.—Work on the Colossal now consists of driving the tunnel into the hill on the vein, and bailing out the water in the shaft; also in sorting a car-load of the rich ore, lately taken out, for shipment to Denver. Supt. McMillen believes that the Colossal will be the leading mine of the Black Range. That it can not be worked much deeper without machinery is evident.

MONTANA.

A BIG VEIN.—*Inter-Mountain*, Oct. 12: S. O. Remington, of Lincoln gulch, reports what must be the banner lead of Montana for width. It is 40 miles from the mouth of Big Blackfoot and about 18 miles from Nevada valley. The ledge is 300 ft wide, and can be traced on top for a distance of 600 ft. The vein samples from $15 to $25 across the entire width, and carries free gold and silver. Mr. Remington has developed the mine by a tunnel 62 ft in length, and is working his ore in an arastra with two 12-ft beds. He states that he has water power sufficient to run 40 stamps. Three-fourths of a mile from this phenomenon is located the Doctor, a claim owned by a syndicate of Helena physicians, the ore from which is being worked in a 10-stamp mill, with very favorable results. This claim was sold two years ago for $600, but it would take a considerably larger sum to touch it now.

A HUNDRED TON SMELTER.—A prominent mining man in Butte to-day received a telegram from Saly Raunheim, who is in New York, stating that he has news of a proposed 100-ton custom smelter, which is to be located in Butte, provided satisfactory arrangements can be made, and asking what inducement will be offered to erect it here. Considerable regret has been expressed from time to time that the Anaconda works were not located at Butte.

COMET CITY.—Butte *Miner*, Oct. 13: The Comet mine is being vigorously developed. About 35 men are employed, and the number is expected to be increased soon to 75 in the mine and mill. Mr. McIntyre, of the Arctic mine, reports fine progress in the development of that mine. Some 800-ounce ore has been taken out and the samples are averaging well all through. The smelter at the Amazon is nearing completion and will be in running order by November 8th.

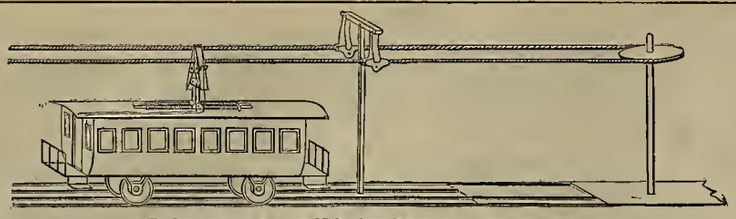
ALICE.—Butte *Miner*, Oct. 10: A drift from the 400 is now being run for the south vein, which seems to make down back of the old workings. So far as developed this ore body improves. In the 100 the stopes are now in a splendid body of black sulphurets, which breaks off from the ledge in blocks and works and mills easily. The ore assays from 120 to 130 ounces. The west drift from the 800 has advanced 125 ft from the bottom of the winze, and the stopes are in 58-ounces ore.

UTAH.

BEAVER LAKE.—Southern Utah *Times*, Oct. 13: The Nabob has been worked by parties who gouged out what ore was in sight, without doing anything towards prospecting the mine, and did not even hoist the waste rock. The present owners have cleaned out the mine, and have gone to work in earnest to develop it. The main shaft, an incline 85 ft in depth, was sunk on a vein of ore which dips easterly. From the shaft four drifts have been run on the vein. Work at present is being prosecuted 80 ft below the surface, and is in 30 ft. A large vein of ore, in some places 5 ft in width, crops out on the surface, directly above this drift, which can be traced for 300 ft. The ledge matter is becoming wider and the face of the drift softer. The ore now being taken out of the Nabob is galena, mixed with the chloride and bromide of silver, and will assay 500 ounces to the ton.

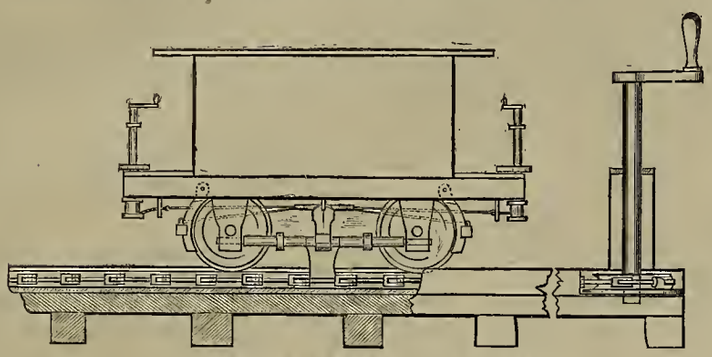
BLUEBIRD.—The ground is soft and can be worked with little powder. The ore is galena, carrying chloride of silver, assaying 60 per cent lead and from 150 to 300 ounces silver to the ton. This is one of the finest prospects in the camp.

WHITE MOUNTAIN.—There is a fifteen foot incline shaft, exposing a vein of ore fifteen inches in width at the bottom. There is a regular hanging wall of limestone. The shaft is sunk through a species of quartzite; the ore is carbonate, and assays 107 ounces in silver and 41 per cent lead.



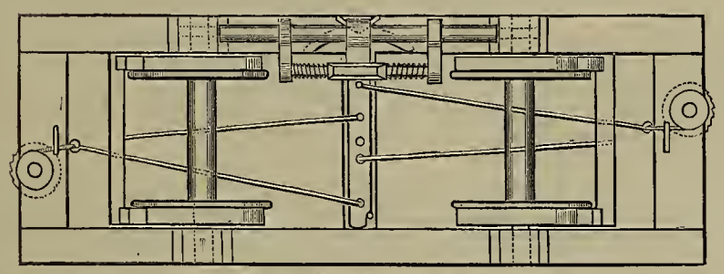
THE O. K.—There are several hundred tons of ore piled on the dump, which will assay between 35 and 52 per cent copper.

CACTUS.—The Cactus Co. is putting a more powerful pump into the mine, and preparing the pipe for winter weather. A set of jiggers and tanks for concentrating work will soon be placed in position.



COMET.—A favorable strike was reported as having been made in the Comet mine Thursday.

WASHINGTON.



COEUR D'ALENE.—*Inter-Mountain*, Oct. 10: From Frank Carey, who has just returned from Pen d'Oreille lake, we gathered the following items. While at the lake he met parties in from the diggings, and from them learned that there are two claims which are being worked and are paying. Barney Rhudebush and Tom Argyle have dug a drain some 400 ft in length, and are thus enabled to work their claims, out of which they are taking some pay. It is a hard country to prospect in, on account of the heavy timber and the amount of water encountered. A shaft sunk 15 ft in gravel had to be abandoned on account of the water, and as it is on a level, the drains will have to be long. The country is but slightly prospected as yet, and at this season of the year it is said to be a good place to stay away from.

Geology of Tombstone.

Prof. Wm. P. Blake, in his discussion of the geology of the veins of Tombstone, mentions beds of limestone, shales and quartzite, the outcropping edges of which had been exposed in many places by erosion. These beds in the central part of the district are thrown in a series of wave-like flexures, which may be traced in some cases upon the surface, and are seen to the best advantage in the drifts and cross-cuts of the mines. The quartzite and shales he considers of deep-sea origin, as they show signs of a granular structure. The quartzite is very hard, and passes imperceptibly into layers, forming beds of siliceous limestone organic in its origin, and appears to be a fine sediment totally different from the quartzites with granular structure in the upper strata. It rests upon doleritic limestone, and is regular and evenly stratified for a thickness of 140 feet, and contains an abundance of pyrites, disseminated through the layers of rock in fine crystalline grains. This bed is described by him as a novaculite or hornstone, and he states that above it are found beds of dark, black or blue limestone, and dark-reddish, alternating with black, siliceous shales, and that the black limestones are the chief repositories of the bedded masses of rich silver ores. These formations have been disturbed and uplifted and broken apart in places and rent with fissures, and the explorations of the mines show frequent faults and disjointed outcroppings of limestone beds. The

Grand Central and Contention

Claims are located upon a dike or fissure, varying in width from a few feet to 70 feet, carrying ore with it and alongside of it, and running in a northern and southern direction, cutting indiscriminately through shales of quartzite and limestone. The harder parts of the dike are the most prominent. The contact with the abutting edges of the disrupted beds is not always marked by any great change in their appearance or composition, though in places there are obscure metamorphism, impregnations of silica, and some modifications of structure. The dike itself has a distinct vertical lamination or structure through most of its substance, and is more or less penetrated by veinlets of quartz. In some portions it is highly crystalline and nearly barren, and in others consists chiefly of a feldspathic base, in which the feldspar crystals are obscure. It passes into a felsite, which, in the decomposed portions of the dike, and when slaty in structure, might be mistaken for the partly decayed shales or quartzite. Large portions of the dike are so penetrated by quartz as to consist largely of it, and might be called quartz, although close examination will show the presence of feldspar. If the Contention fissure, upon which the Grand Central is located, is of igneous origin, as asserted by Professor Blake, then there can be no question of the lode going down, and that, too, with a probable increase in size and strength. Thus far the developments in Grand Central substantiate this view of the case, the ledge so far developed on the 600 level being stronger than at points nearer the surface.

The question of the continuation of the ledge downward being settled in the affirmative, the next question is as to its probable

Ore-Bearing Qualities.

For a solution of this last and equally vital point, we are compelled to draw our conclusions from analogy. Looking over the broad field of mining, the world over, we find that where true fissures have been subject to extensive operations, the ore has been found to make with the ledge—in variable quantities, it is true—to the utmost depth attained upon them. Another fact to be taken into account is the manner of occurrence of ore laterally within these fissures. It is a well known fact that the paying bodies are found in chimneys or shoots of ore of variable lengths, often separated by long intervals of barren ground. Thus, too, in depth, these ore bodies are found to have a limit succeeded by barren vein matter. Take the Comstock as an illustration. The surface bonanzas commenced upon the north with the Ophir; thence, going south, came the Gould and Curry, Chollar, and Gold Hill mines. The deep bonanzas were California, Consolidated Virginia, Savage, Hale and Norcross, and Belcher—being sandwiched in between the lesser surface deposits. That a similar condition of occurrence of the bonanzas in the Contention fissure will be found, we have every reason to believe, and that the utmost limit of production will be reached before a depth of 1,500 to 2,000 feet is attained is hardly probable. What may be found below these points, nothing but persistent work will tell.

The Black Hills Tin Mines.—The Deadwood *Pioneer* says: C. Stratton, of the Terra mill, called at this office the other day with a handsome little bar of tin, run from three ounces of ore, taken from the new Sand Creek district. Mr. Stratton is interested in six claims, located on Nigger Hill, Mallory and Sand Creek gulches, and being a practical miner, with many years' experience, knows a good thing when he sees it. The assays recently made by Barclay returned sixty per cent tin, or from forty to forty-five per cent greater than ore from the celebrated Cornwall mines. Not much work has been performed, but great encouragement has been encountered. As Mr. Stratton says, it is a question of quantity, not quality. The quality is all right.

Useful Information.

Paper Marble.

In consequence of the greater hardness of surface and the ability to resist the action of acids, slate or low-grade marble, having an artificial or "marbleized" surface, has to a great extent superseded fine marble in the construction of mantels; but artificial-surfaced articles have always been open to the objection that if any portion of the surface became broken or in other manner injured the exposed portion of the base would present a different appearance, and at once expose the artificial character of the marble represented. Such injury is especially liable to occur while mantels are being shipped and set up, and materially lessens the value of marbleized work. To obviate this objection and produce an article that is cheaper, more durable, and has less weight, an artificial marble composed of a paper base or body and having its surface marbleized has been produced. In the production of this artificial marble, slabs are made in the following manner:

To one and one-half tons of paper pulp, add a solution composed of forty-nine pounds of glue, one and one-eighth pounds of bichromate of potash, fifty pounds of alum, and two pounds of soluble glass or other silicate. This solution is thoroughly mixed with the paper pulp, and the composition is then made into sheets by any ordinary paper-making machinery, the sheets being, however, subject to more than ordinary pressure between the rollers, so as to give them great density. Two or more of the sheets are now coated with the solution named, and placed with their faces in contact, after which they are passed between the pressure rollers, so as to cause their faces to become firmly united, and the whole to be practically homogeneous. The alum and silicate render the slab fireproof, so that it is able to withstand the heat necessary during the marbleizing process, which latter is the same as ordinarily employed in marbleizing slate. The artificial marble thus formed has about the weight of poplar wood, is far more tough and durable than slate, and can not be dented or otherwise injured by any ordinary use, while nothing less than extreme violence can cause breaking or bending of a slab.

The cost of this artificial marble is said to be much below that heretofore obtainable, and its introduction will materially lessen the expense of mantels, shelves, etc., usually made from marble, while from its greater strength and ability to withstand injury, and its small weight, the artificial product is applicable to a variety of purposes for which marble or slate possess no value.—*The Artisan, Nashville.*

Castor Oil for Shoe Leather.

We have several times in past years commended castor oil as a "water-proofing" for boots and shoes, and we are glad to be able to quote the following, to the same effect, from so good an authority as that oracle of hunters and sportsmen the London *Field:*

There is one simple article which will render any decently made boot thoroughly impervious. It is nothing more or less than cold-drawn castor oil, "pure and simple." It is best applied before a moderate fire. The boots to be dressed should be quite clean and dry, and special care should be given to the welt and the tongues and their stitching to the upper leathers. I generally begin by pouring the oil from the bottle all round the welt, so that the angle between the sole and upper leather is quite filled with oil, and then proceed all over the boot, including the edges of the soles, rubbing it in with the hand. When one is done, have a turn at the other, and so alternately till you have got in about a tablespoonful and a half to each boot. The tongues, being thinner leather, should be quite saturated. Subsequent dressings will not require so much oil. I have never found any thing to touch this as a water-proof dressing; the gelatinous oil seems to effectually stop every pore in the leather. There is another advantage for those who are natty in such matters: the boots will soon take a good (common blacking) polish—so much so, that a man may if he likes water-proof his ordinary walking boots for bad weather without spoiling their appearance. With a common walking boot of ordinary thickness, apply the oil all over the sole. Shooting, I wear boots so treated, over thick woolen socks, from eight to twelve hours a day, or more, without feeling the slightest inconvenience in any way;—but they have the chilly feel inseparable from all boots that are oiled in any way.

Paper Gaspipes.—These are made by passing an endless strip of hemp paper, the width of which equals the length of the tube, through a bath of melted asphalt, and then rolling it tightly and smoothly on a core, to give the required diameter. When the number of layers thus rolled is sufficient to afford the desired thickness, the tube is strongly compressed, the outside sprinkled with fine sand, and the whole cooled in water. When cold the core is drawn out, and the inside served with a water-proof composition. In addition to being absolutely tight and smooth, and much cheaper than iron, these pipes have great strength; for when the sides are scarcely three-fifths of an inch thick, they will withstand a pressure of more than fifteen atmospheres. If buried underground they will not be broken by settlement, nor when violently shaken or jarred. The material being a bad conductor of heat, the pipes do not readily freeze.

Decorating Zinc Articles.

A beautiful and permanent dark or light green coating, resembling enamel, can be applied to all kinds of zinc articles, especially those made of sheet zinc, says Puscher, in the following manner:

Fifty parts of hyposulphite of soda are dissolved in 500 parts of boiling water, and the solution poured at once, in a fine stream, into 25 parts of strong sulphuric acid. The milk of sulphur that separates will soon ball together in lumps, and settle. The hot liquid containing sulphate of soda and sulphurous acid is decanted, and the cleansed zinc put in it. In a short time it will acquire a very brilliant light-green coating of sulphide, and only needs to be washed and dried. By exposing it repeatedly and for a longer time to this hot bath, the coating grows thicker and the color darker and more brilliant. The temperature must not fall below 145° Fahr.; when it does, it should be heated up to 190° Fahr., to obtain a fine and brilliant deposit.

By dipping these articles in dilute hydrochloric acid, 1 part of acid to 3 parts of water, sulphuretted hydrogen is evolved, and this enamel-like coating loses its luster and gets lighter in color. Aqueous solutions of aniline colors have little effect upon this dull surface, and none on the gray brilliant coating.

The effect of marbling can be obtained by moistening the gray zinc and applying hydrochloric acid in spots with a sponge, then rinsing it off, and while still wet flowing over it an acidified solution of sulphate of copper, which produces the appearance of black marble. As the zinc has generally a dull surface, it must receive a coat of copal varnish.

If 15 grammes of chrome alum and 15 more of hyposulphite of soda be added to the above solution, the article will have a brownish color. The above can all be applied to articles made of cast zinc.—*Neueste Erfind.*

Tar may be readily removed from the hands by rubbing with the outside of fresh orange or lemon peel, and wiping dry immediately. The volatile oils in the skins dissolve the tar, so that it can be wiped off.

Good Health.

Artificial Nourishment.

One of our foreign exchanges relates a novel method for administering nourishment to invalids and persons with weak digestion, which, it is alleged, has been practiced in Paris with much success.

Diseases and enfeebled health commonly owe their origin to the imperfect assimilation of food. When the digestive functions are impaired the body is insufficiently nourished, and is unable to resist the encroachment of disease. For the maintenance of health and for restoration from sickness, it is of the first importance that the food be not only of the most nourishing kind, but that it be administered in a form easy of digestion and assimilation.

In a paper recently communicated to the Medical Hospital Association, Paris, by Dr. Debove, he describes a form of alimentation which has attracted much attention. His system is to supply nourishment in the form of powder instead of bulk. Uncooked meat from which the fat has been removed is minced finely, and allowed to dry in an oven of moderate heat, until it becomes perfectly hard without being burned. It is then reduced to impalpable powder, by pounding in a mortar and passing through a fine sieve. The powder so obtained represents about four times its weight in flesh. The fiber and the large percentage of water contained in the flesh are thus removed, and the essential properties of the meat retained and presented in a form not difficult to digest. Other alimentary substances, such as lintels, beans, peas, etc., can be prepared in the same way.

In cases of consumption the treatment is said to have proven remarkably successful, and in general debility and nervous diseases arising from weakness, restoration is rapid and permanent. A few spoonsful of the powder are equal to the meal of a person with a healthy appetite. The powder, when bottled, will keep an indefinite time, and may be taken with a little milk, gravy, wine, water, or other liquid.

Nervousness.

In a very interesting pamphlet by the late Dr. Beard, published just before his death, he throws considerable doubt upon the generally accepted theory of the increase of American nervousness. He claims that his researches upon this subject have formed the foundation of a large and increasing literature in England and Germany. He argues that far from nervousness being a destructive agent in American life, Americans of the brain-working class live longer than Europeans. He further argues that the nervous temperament is antagonistic to fatal, acute, and inflammatory disease, and favorable to long life; that most annoying nervous diseases do not rapidly destroy life, and are consistent with great longevity; that nervousness protects the system against the febrile diseases that are so rapidly fatal to the sanguine and phlegmatic. "In the conflict with fevers and inflammations, strength is often weakness and weakness becomes strength. We are saved through debility." All these facts should afford considerable comfort to those who think that nervousness is wearing their lives away. Negroes are seldom nervous, and yet their mortality through acute diseases is far greater than that of the whites.

Nevertheless, it is well to bear in mind that if we order our lives as we may,—live more naturally and wholesomely,—we may avoid much of the nervousness so prevalent, and thus live longer and happier still.

Medicated Gelatine in Skin Disease.

Prof. Pick, of Prague, has recently advocated a new method of applying remedies to diseased skin. He melts in a water-bath some pure white gelatine, in twice its weight of distilled water, and while keeping up an incessant agitation, adds the quantity of medicinal substance; e. g., iodoform, salicylic or phenic, and pyrogallic acids, and then allows the mass to cool. For use, a portion of this mass is melted in a little receptacle placed in boiling water, and is then applied to the diseased skin by a camel-hair brush. It presently sets, and compresses the skin; but unless smeared over with a little glycerine, in the proper use of which some little experience is needed, the gelatine is apt to crack and fall off. In this way Pick has obtained good results, by the application of a gelatine containing 10 to 20 per cent of pyrogallic acid, or 10 per cent of chrysarobin, after a thorough washing of the parts with potash soap in a warm bath. In severe cases he renews the applications every two days. He has also successfully employed gelatine, medicated with 5 to 10 per cent of salicylic acid, in chronic eczema and some erythematous conditions, and in pruritus. The gelatine is easily removable by washing.

The Birth of the British Isles.—Under the title of "Contributions to the Physical History of the British Isles," Professor Edward Hull has lately published an interesting, if somewhat hypothetical, contribution to Paleophysiography. Perhaps the most remarkable conclusion to which the author has been led by his studies of the evolution of the British Islands, is that which relates to the period of their birth. He believes that until the close of the carboniferous period the British area had no existence as continuous dry land. But at that epoch a series of subterranean disturbances upheaved the sea-bottom in that part of the world and at the same time threw what is now the eastern part of America into a great succession of ridges or folds. These violent upheavals were accompanied by depressions in the intermediate area, and thus the North Atlantic Ocean came into existence contemporaneously with the origin of the British area. In discussing the genesis of the Atlantic Ocean, the author strongly combats the popular dogma relating to the permanence of oceanic and continental areas. Nevertheless he admits that the old mountainous tracts of the north and west of Britain and Ireland, when once formed, have ever since retained their prominent position, and have been rarely, if ever, submerged. For the details of these interesting arguments the original work must be consulted.

Salt With Nuts.—A correspondent of the Germantown *Telegraph* writes that journal as follows: One time, while enjoying a visit from an Englishman, hickory nuts were served in the evening, when my English friend called for salt, stating that he knew a case of a woman who was taken violently ill by eating hearty of nuts in the evening. The celebrated Dr. Abernethy was sent for, but it was after he had become too fond of his cups, and he was not in a condition to go. He muttered, "Salt! salt!" of which no notice was taken. Next morning he went to the place, and she was a corpse. He said that had they given her salt it would have relieved her, and if they would allow him to make an examination he would convince them. On opening the stomach, the nuts were found in a mass. He sprinkled salt on this, and it immediately dissolved. I have known of a sudden death myself which appears to have been the effect of the same cause. I generally eat salt with nuts, and consider it improves them.

How Cholera is Bred and Spread.—In a communication to the London *Daily News*, Dr. Wm. B. Carpenter suggests that Professor Tyndall's doctrine that cholera germs are bred in the human intestines, and from them by means of excrement are diffused, does not go far enough in assuming by implication that the human intestines are the only breeding-place of cholera germs. Dr. Carpenter gives three remarkable instances as evidence that cholera, or at least the almost equally fatal choleraic diarrhœa, was caused by offensive piggeries, by a retarded drain in marshy ground, and by a compost heap of unnamable filth in an unused yard. The outbreak of fatal disease in each of these cases was directly traced to these sources, the effluvium being born on the wind. In each the disease was successfully combatted, and finally conquered by a removal of the filthy cause.

Passing Events.

A great deal of the space in the PRESS this week is devoted to a description of cahle railroads, so that much of our usual mining matter has been left over. A perpetual injunction has heen granted this week against the Spring Valley Miniug Co. to prevent it dumping debris ou certain lands. The company already own several thousand acres of land, purchased for the purpose of dumping ground, and will now have to huy this, prohahly. The latest mining excitement is that in the Cœur d'Alene Mountains, and hoth Idaho and Montana miners are rushing there in numhers, since rich placer mines will always attract a crowd. Winter has set in there, however, so there is not much chance of doing any thing for some time to come. We have rains iu California this week, and in a few weeks, now, winter will set in in earnest.

THE Hailey *Times*, of the 13th, says the Silver King mine, in Beaver Gulch, above Sawtooth, was sold on Saturday to M. T. Scott and Jahez Chase for $125,000.

Cable Railroads.

Growth of the Wire-Rope System for Street Care in San Francieco.

We devots considerahle space in this numher of the MINING AND SCIENTIFIC PRESS to a description of the latest cahle railway huilt in this city. San Francisco, from its peculiar topographical features, was compelled to have some system of street-car transportation which would permit steep grades to he ascended and descended. Cars drawn hy horses or hy steam power are, of course, not adapted to the irregular and steep hills which form so large a part of the city's surface, and it was greatly to the advantage of the whole growth of this metropolis when the cable railway system was put in operation, mainly hy the efforts of Mr. A. S. Hal lidie and associates, who have continued to he prominently identified with it.

A good many ideas of wire-rope transportation for city streets had heen advanced from time to time, and the systems patented; hut none of them were put to practical and successful work until the Clay-street hill road was first operated in this city in 1873. On page 262 are several illustrations of various inventions illustrating the chronological progress of cahle railway improvements, up to the date of inauguration of the first road in this city. Since that time there have heen built here, on the cahle system, the Sutter street, Geary street, California street, Presidio, and Market street roads. The system has also heen introduced in Chicago, Philadelphia, New York, and London. As each successive road has heen built, improvements in details on the general system have suggested themselves and been adopted. On some roads the conditions have heen different from others, and these peculiarities necessitated greater or less modifications, according to their nature. Being a comparatively new field of engineering, there was, of course, much scope for inventive ingenuity, of which practical men have availed themselves. Inexperienced persons, too, have conceived ideas ahout cahle roads, many of them quite startling in their nature. In fact, numerous patents which have heen granted will he of very little use from their impracticahility. At the same time, improvements in detail to simplify and perfect have heen made and adopted, so that now many of the obstacles and difficulties first met with have been removed.

The Clay street line, the first huilt, hegan running in August, 1873, and was a success from the first, though, like all new things, some changes and alterations had to he made before all the difficulties could be overcome.

At the time of the completion of the Clay-street hill road we described its details. In the PRESS of Septemher 3d, 1881, was puhlished quite an elahorate illnstrated article on the various roads in this city, giving a history of the growth of the system, and descriptions of the local roads. Those interested in the details of these roads are referred to that number. To those who have never seen a cahle railroad, the article in the issue describing the Market street road—the most extensive yet huilt, in length, cost, and equipment—will convey a good idea.

The surface of the streets through which a cahle road runs has the same appearance as in the case of a horse car line, except that between each pair of tracks is a flat, narrow piece of iron, with a three-quarter inch opening in its center, running the length of the road, parallel with the tracks. Below the surface, and between each pair of tracks, is a channel or tuhe large enough to contain a rope, with supporting pulleys, and the jaws of the grip. The object of the tuhe is to protect a steel-wire rope, which runs the entire length, up one track and down the other. This endless rope is kept in constant motion hy means of an engine at one end or the center of the road, the rope passing around suitable driving pulleys rotated hy the engine. Different methods are adopted to prevent the rops from slipping on these drivers. At each end of the road is a large pulley, half around which the rope passes, so as to go from one tuhe to the other. A gripping arrangement is mounted on the car or dummy, hy which the car and cahle may he connected or disconnected at will hy the engineer, or dummy-man, who controls the apparatus by means of suitahle levers. Various forms of this grip are used on our local roads, and several other forms have heen patented which have not heen put to use. The rope ou the tuhe is carried on freely-running supporting pulleys, and specially constructed depression pulleys are used for holding the ropes down at the cross streets, on grades where the angle changes. The rope is run at a speed of from five to eight miles per hour, and the cars run at equal speed on a level or up or down the hills. Powerful hrakes, both on the wheels and track, control the car when the cable is released.

Such are the general principles of the cahle railroad system. Of course there are various details on each road, arranged to suit the special requirements or to carry out the improvements made hy the constructing engineers. The plans latest tried are fully described in the article on the Market street road in this number of the PRESS, that road having adopted every improvement of any practical valne which would increase its efficiency.

We have not space on this occasion to say much of the other San Francisco cable roads, hut append a tahle which will give some salient points concerning each.

The diagrams on page 270 show the profiles of these roads. The Market street—the last built—is the longest road, and the Clay street—the first huilt—is the shortest. The latter, in fact, is only built and operated as far as the point designated hy the vertical white line shown in the profile.

All these roads are in daily operation. They are always preferred to the horse cars by the public. On most routes they go where horse cars could not he run, and then equal speed up or down a hill is of course a very great advantage. Once in operation, these roads are run much more cheaply than when operated hy horses, although the first cost of the road is of course greater with the cahle system. The most economical results for the consumption of coal have been obtained on the Presidio road, where they are using engines of the Corliss type, huilt by Hiuckley, Spiers & Hayes, of the Fulton foundry, in this city.

These roads, without exception, have heen profitahle from the beginning, no cable road yet built having heeu a losing operation. In every instance, however, the stock is worth from twenty-five to sixty per cent more than it cost, which is a very important point for capitalists. The experience gained in this city is heing utilized elsewhere, as a matter of course. Most of the patents granted on improvements on cahle roads—for there is no broad patent in existence coveriug the general system—have heen taken out by San Francisco inventors. Here the plan was worked out to practical results, until now San Fraucisco has the reputation of having the most complete, convenient and speedy street-car transportation system in the world.

TABLE SHOWING CONDITIONS UNDER WHICH THE SAN FRANCISCO CABLE ROADS OPERATE.

NAMES OF ROADS.....	CLAY ST. HILL R. R.	SUTTER ST. R. R. CO.	CALIFORNIA ST. R. R.	GEARY ST. R. R.	PRESIDIO R. R.	MARKET ST. R. R.
Commenced operating.....	September 1, 1873.	January 27, 1877.	April 9, 1878.	February 16, 1880.	October 23, 1880.	August 22, 1883.
Length of road, double track.	5,300 feet.	On Sutter St., 13,291 ft. On Larkin St., 3,712 ft.	12,651 feet.	13,200 feet.	13,000 feet.	44,200 feet.
Heaviest grade.....	67 feet in 412½.	36 feet in 412½.	75 feet in 412½.	40 feet in 412½.	80 feet in 412½.	51 feet in 412½.
Number of engines employed.	Two.	Six—4 on Larkin street, 2 on Cemetery avenue.	Two.	Two.	Two.	Four—2 spare.
Weight of empty car.....	2,800 pounds.	3,000 pounds.	4,500 pounds.	4,000 pounds.	4,300 pounds.	Combined, 9,600 lbs.
Weight of empty dummy....	2,100 pounds.	2,000 pounds.	4,100 pounds.	4,400 pounds.	4,300 pounds.	
Intervals of departure.....	3 to 5 minutes.	4 minutes, average.	5 minutes, average.	2½ to 6 minutes.	4 to 6 minutes.	4 minutes.
Average number of round trips per day	221.	253.	226.	228.	210.	493.
Average number of cars and dummies employed.....	7 of each.	14 of each.	14 of each.	16 week days. 20 Sundays.	16.	36 to 44.
Hours run per day	17½.	19½.	19.	19.	17½.	20 hours and 40 minutes.
Number of wire ropes in use.	One.	Four—Sutter street 3, Larkin street 1.	Two.	Two.	Two.	Five.
Lengths of ropes used	11,000 feet.	11,537 feet. 7,849 feet. 9,800 feet. 8,500 feet.	8,840 and 17,055 feet.	16,600 and 11,000 feet.	12,500 feet. 13,500 feet.	24,125 feet. 20,194 feet. 20,002 feet. 20,439 feet. 6,000 feet.
Circumference of wire rope..	3 1-16th inches.	3 inches.	4¼ and 4 inches.	3 inches.	3¼ inches.	3¾ inches.
Speed at which ropes travel..	525 feet per minute.	421 ft. and 786 ft. per min.	537 feet per minute.	600 and 650 ft. per min.	537 feet per minute.	750 feet per minute.
Remarks.....	The engine house is located on top of the hill, and about midway between the two ends.	This company has two engine houses. In the one there are four engines, and in the other two.	The engine house of this company is situated in the hollow, 4,220 feet from Kearny street.	The engine house of this company is situated 8,000 feet from Kearny street.	Engine house is 6,000 feet from Montgomery Avenue.	The engine house is 11,900 feet from the ferry.

A Double Edition.

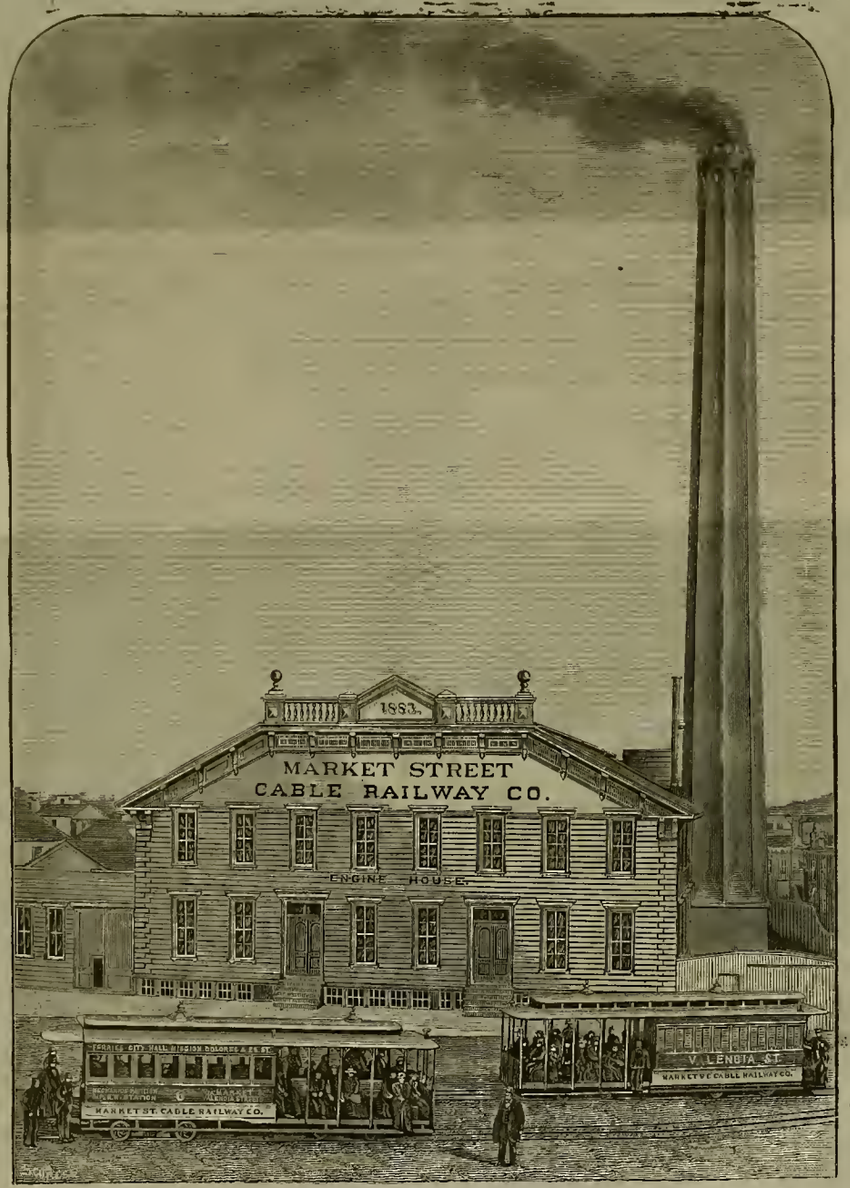
This number of the MINING AND SCIENTIFIC PRESS is a double sheet of twenty-four pages, largely devoted to consideration of cahle railroads, a subject for a long time one of local interest only, hut now attracting attention all over the world. We describe in detail the last one completed of our local roads, and give numerous original engravings to aid the description. There are also other engravings illustrating the growth of the cahle system, etc.

This number of the PRESS possesses increased value not only to engineers hut to the general puhlic. We have printed a very large edition—some thousands more than usual—appreciating the desire to learn the details of construction and operation of these roads. The PRESS of this week will be found worthy of preservation for reference.

THE United States Sub-Treasury in San Francisco has now prohably a larger amount of money on hand than at any previous time in its history. The total is upward of $71,000,000, including $35,000,000 in gold coin, $16,000,000 in standard dollars, $7,000,000 in fractional silver, while the remainder is in paper money. There could not he a hetter man to take care of this large amount of money than N. W. Spaulding, the Assistant Treasurer.

The Market Street Cable Road.

(Continued from page 257.)



in 100 at the steepest place. The diagram shows a profile of Haight street.

The Engine House.

The engine house where the motive power of the cables is applied, is on the south side of Market street at the junction of Valencia. At this point Valencia leaves Market by a curve to the southeast, and Haight street branches off at an angle of about 35 degrees from Market to the northwest, some 500 feet before Valencia is reached. The plan accompanying this shows the relative position of these streets. In the rear of the engine house are bunkers which hold 2,000 tons of coal, which may be dumped into them through chutes in the yard above. Heavy brick pillars and arches support the roof of this portion, which forms the floor of the yard above. Outside the coal bunkers is an artesian well which supplies the boilers with water. One of Dow's direct-acting deep-well pumps raises the water from this well, supplying first the heaters for the boilers, the surplus going to a tank above.

The main portion of the basement is covered with a heavy brick flooring and foundation to the boilers, engines, heaters, etc. The room is well lighted and ventilated. In the rear of the engines are the long pits and tracks for the stretching apparatus. One of the engravings given with this article shows the plan of the engine-house, and arrangements on the street for the angle sheaves of the various cables. G are the spur-wheels of the engines, which engage with each other, though the engraving shows a clear space between. The drivers are represented by H. The cable from the ferry is represented at A; and the same rope, returning to the ferry after going around the drivers and tighteners in the engine-room, is represented at B. The sectional view shows the tighteners. The Haight street incoming and outgoing rope is represented at F F. The outgoing Valencia street cable is marked by C, and the incoming one by D. The auxiliary rope is represented by E, and its side-bearing sheaves are also shown.

Outside, the most prominent feature of this building is the chimney, which forms an important landmark, and is next to the largest on the coast. The base is nine feet below the level of the fire-room floor, so that it is about twenty-four feet below the surface of the ground. The foundation is thirty feet square, battering in one inch to the course until it comes to sixteen and a half feet square, where the flue enters. Then it goes up to the water table, about ten feet above the surface of the ground. For the rest of its hight the chimney is in the form of an eight-cornered star. The inside is a circle seven feet six inches in diameter. The top of the stack is 175 feet above its foundation, or 166 feet above the fire-room floor. It was necessary to have this very high stack not only for good draft, but also to deliver the products of combustion high up out of the way. We give an engraving showing the exterior of the engine house.

ENGINE HOUSE OF THE MARKET STREET CABLE RAILROAD.

The Engines.

The power for the road is two pair of engines, with cylinders 34x48 and 24x48, a large and small one being compounded to work in pairs. The expansion cylinder has a capacity of double the initial cylinder. They are compounded by direct connection between the bottoms of the large and small cylinders. There is no extra receiver, the pipe answering as the receiver. Only one pair run at a time, the other pair being spare engines, to use in case of breakage of the others. These engines have Scott pillow-blocks, and the O'Neill cut-off, with automatic governor. They were made by the Union Iron Works of this city. The engines are well made, and are doing very satisfactory work, the cards showing great efficiency.

Each pair of engines furnishes 400 horse-power in ordinary working, and is capable of working up to 700 horse-power. The pinion on the engine-shaft is 4 feet 1 inch in diameter, and 20-inch face. It connects with a spur-wheel 12 feet 6 inches in diameter and 20-inch face, which in turn meshes with another spur-wheel of same size. Each spur-wheel shaft has two reels for the rope. The engines are set in pairs 19 feet apart. The diagram given shows the position of the engines with relation to the reels, guide-pulleys and tension apparatus. The steam pipes for the engines were furnished by W. T. Garratt & Co., of this city. The exhaust pipes were made by H. W. Rice, manufacturer of portable engines and boilers, in this city, and a very satisfactory job he made of them.

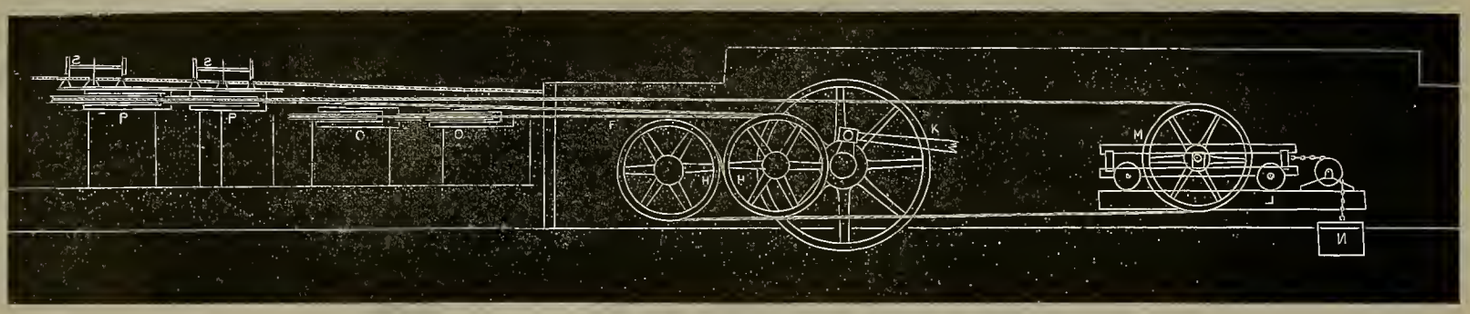
The boilers in use are the first of the Babcock and Wilcox type ever put up on this coast. They came here all built and ready to put up, and are guaranteed to be of 250 horse-power for each section, there being four sections. These boilers are very substantial looking structures. There is a Llewelyn water-heater, 5 feet in diameter, and a fine pair of the Dow steam pumps, made in this city.

The Driving Arrangement.

The driving method is what is known as the American method of driving, and is about the same as that used on the "Gordon Plane" in Pennsylvania. The engraving shows the general arrangement. Two pulleys, H H, 12 feet in diameter are placed in line. The rims are loose, and in between these rims are bolted blocks of wood, two inches thick and set on end. Maple is used here, but beech is supposed to be better. The rope passes in from the street on a slight downward incline, just clearing the top of the forward driver, and passing on to the top of the rear one (or that next the engine, K). It passes three-quarters of the way around, and thence upward, diagonally forward, over the top of the forward one, then down and backward, just clearing the bottom of the rear one, to the tension pulley, M, on the stretching carriage. There are only three-fourths of a turn on each of these drivers, or one turn and a half in all.

Yet this drives 24,000 feet of rope with heavy loads. One would hardly suppose that mere friction of the rope would admit of this, but that it would slip. The tension apparatus is the secret of this result; without that it would be impossible. The automatic action of the weighted tension pulley, however, is such as to keep the rope closely jammed on the driving pulleys, so that it is not easy for any slip to occur. The great advantage of this method is the small number of wraps on the drivers, as wraps on drivers form one of the principal sources of breakage and wear on cables. The improvements on the old English system (where numerous wraps are used) patented by S. B. Whiting in 1876-7, and used on the Brooklyn bridge, are unsatisfactory, for this reason: the friction wheel from which the power is derived, located in line between the shafts carrying the driving drums, relieves the bearings, but the old and principal fault of the wrapping of the rope still remains. As the part of the pulleys where the rope first comes on wears the most, the driver is not kept of uniform size. Therefore, the rope has to "overhaul" to compensate for difference in circumference between the sides of the driver where the rope comes on and goes off. This overhauling throws excessive strain on the rope, and soon breaks or tears it to pieces. By the system we have described as in use here this objection is overcome, the rope nowhere taking a complete turn of any driver. In the engraving F F shows the Market street cable; O O the Haight street angle sheaves; P P the Market street angle sheaves; and S the cars on the tracks.

On the same shaft carrying the drivers are large gears, of about the same diameter as the drivers, operated by a spur on the engine shaft of one-third their diameter, so the engine makes three revolutions to one revolution of the drivers. V-teeth are used on these gears, and they are four and a half pitch and eighteen inch face. There are four sets of these drivers for the four ropes, but one set of gears and one pair of engines operates them all. The other pair of engines is held in reserve as a spare set in case of accident.



The Stretching and Tightening Arrangement.

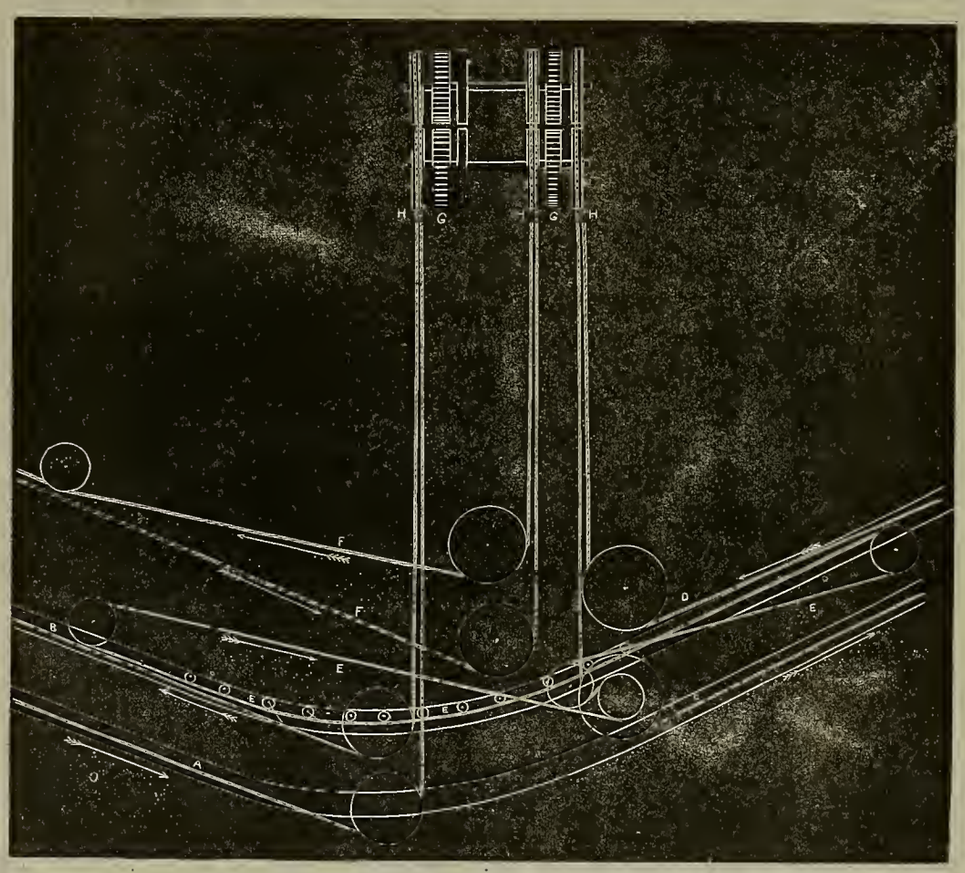
The tension of the wire rope on all these roads is something which has to be provided for, otherwise there would not be a uniform tension maintained. Moreover the change in length, with the ordinary changes in temperature, during the day and night, of 24,000 feet of metal cable, must also be looked after. On a hot day the cable is several feet longer than on a cool one, and this ever-varying change in length must be compensated for, and the apparatus for doing this must be automatic. The rope is furthermore continually lengthening by wear, and during the life of a rope the total stretch is about one per cent of its total length. The method in use on this road is considered to be the best known. Of course each rope has to have a separate stretching and tension arrangement. The principal object in keeping the uniform tension is to prevent the rope slipping on the drivers, it being driven merely by friction. Behind the engines in the engine room, and in line with the driving pulleys, brick-lined excavations 165 feet long each and five feet wide and deep have been made, one for each cable. Over each one is a stretcher arranged for a separate cable. A description of one will serve for all. A large and heavily framed carriage, L, mounted on wheels and moving on tracks, is placed over the excavation. A pair of tracks, close together, is on each side, and each pair forms a rack-bar, with which a pawl on the carriage engages. These pawls prevent the carriage moving forward, as the strain of the cable tends to make it. On top of this main carriage is a smaller one, also on rails, the rails being on the main carriage.

The small or supplemental carriage carries a vertically revolving pulley, M, about thirteen feet in diameter. The cable or rope, after it passes around the main drivers of the engine, extends back around this pulley on the carriage. A very heavy weight, N, hanging on a chain and connected with the supplemental carriage, passes over a chain wheel on the lower carriage, and draws backwards on the upper one, thus keeping a constant tension on the cable equal to one-half the amount of the weight, the strain being divided between the upper and lower ropes. This tension pulley prevents any slipping of the cable on the drivers, as elsewhere described.

The function of the lower carriage is to take up the permanent stretch of the rope. When it is found that the weight is settling down into the pit, it is known that the cable has permanently stretched. Then the lower carriage is moved back, and the pawls are dropped into the ladder formed by two T-rails with pins through the webs, forming a sort of rack bar, thus holding the lower carriage in its position. This moving of the lower carriage is accomplished readily, notwithstanding the strain of the cable, and without necessitating

the slowing of the ropes or interfering in any manner with the operation of the road. A heavy tackle is hooked to the rear end of the carriage, and the tail rope or hauling part is taken to a spindle on the end of the axle of the main sheave on the supplemental carriage. This is revolving steadily all the time, and by taking a few turns of the rope, the tackle is operated by the power of the cable itself, and the carriage hauled back on its rails, the pawls before described automatically engaging with the teeth or pins provided for them, thus holding the carriage at the desired point. As the lower carriage moves back the weight rises and the upper carriage remains stationary, but changes its position with relation to the lower one. That is, when the lower carriage is drawn back as far as desired, the supplemental one is at the front end of the lower one ready again to be moved back automatically by its compensating weight. By the arrangement described 330 feet of each cable can be taken up.

SECTION OF ANGLE SHEAVES, DRIVERS AND TENSION APPARATUS.



The Wire Cables.

The wire cables in use by this company were made by John Roebling Sons Company, of Trenton, New Jersey. The rope is an inch and a quarter in diameter and weighs 2½ pounds to the running foot. It is made of crucible-steel wire. There are six strands of nineteen wires each around a manilla rope heart. The main or Market street cable is 24,125 feet long; the Valencia street is 20,194; and the Haight street 20,002 feet long. The McAllister street cable, from the engine house at Masonic avenue to Market street, is 20,489 feet, and from the engine house to the western terminus at Fulton and Stanyan streets, 6,000 feet. The last two are the same kind of cable as the main line, but made by the California Wire Works of this city. The cable is lubricated entirely with castor oil. Tar is first used to fill up with and castor oil is added as the rope fills, until it alone is used. They have to avoid the use of tallow and other animal fats.

The Cars.

One of the questions in connection with the new road which was most carefully considered was that of the construction of the cars. It was known that the traffic would be heavy at certain hours, both morning and evening, and that the ordinary form of car and dummy was not entirely satisfactory. Moreover, in changing a street road operated by horses and having the usual large stock of common four-wheeled cars, to a cable road, several things had to be taken into consideration. The outlay for reconstruction must be large in comparison with the original cost of the road, and as the total cost of the cars is but a small percentage of the whole, the car must be so constructed as to fulfill the following requirements: 1. To be as safe as possible for the public; 2. To ride easily, either empty or loaded, and carry large loads if required; 3. To be easy to get on or off, and neat and symmetrical in appearance; 4. To be cheap in first cost and maintenance, and so arranged that old horse cars can be converted to cable cars without great sacrifice to property. All of these requirements seem to be fulfilled in the combination car in use on the Market street road.

The cars and dummies on this line are made in one. They are different from any previously made, being entirely original in design. They have more the character of a steam than a street car, as the engravings show. The whole car is thirty-four feet long, and weighs 9,600 pounds. The forward part, for a distance of fourteen feet, is open all around, but has a roof supported by ornamental posts. In the center is the brake and grip mechanism, and the engineer or dummy man stands isolated in such a position that he can see ahead and on both sides. There are two front seats on each side, but the center is open in front, so no passenger can obstruct the view. The seats on the side are wide and comfortable, and set back so the passengers' feet are inside the line of the sides of the car; they are completely protected from passing vehicles by four strong posts. They are high up, also. Outside is a broad step running lengthwise the car on each side, and on these many can stand and hold on by the strong iron vertical hand-bars shown in the engraving.

PLAN OF DRIVING DRUMS, ANGLE SHEAVES AND CABLES.

The object of arranging the seats so that the passengers may sit with their feet inside the line of the side frames of the car, is to avoid liability to accident. In case of a wagon being backed against the car, or striking it in any way, the passengers are up out of harm's way. The height of the seat takes them up out of the dust also. The whole arrangement of these cars has proved highly satisfactory to the public and to the company. They carry large loads of passengers, run smoothly, and round the curves readily. They are, moreover, handsome in appearance. They are constructed in such a manner as to combine great strength with lightness. A noticeable feature is the absence of any jogging or jarring motion ordinarily incident to dummies. Market street being the main thoroughfare in the city, it was absolutely necessary to make the cars safe. It is easy to get on or off, by reason of the many posts and handles for support.

There is no communication for passengers between the car and dummy, and people can not come out of the front of the car to alight. Most of the old street cars of the Market street line have been utilized by an open portion being built on though unless it was pointed out, the connection would not be seen. The front platforms are removed, but otherwise the cars are not changed. These cars are light and well ventilated, and their interiors are all of bright varnished woods, with wooden perforated seats. The car body has each end supported on four wheels, united by a frame or truck having a pivot or swivel, so that the trucks may turn and accommodate themselves to the curvatures of the road, as on ordinary passenger coaches. The grip is mounted on the solid truck of the forward or open portion of the car, an opening being made in the floor for it to project up through. As the distance between the pairs of wheels on the truck is small, the movements of the truck in accommodating itself to the curvature of the track are small, and do not affect the grip. The long car-body can make long and sweeping curves, necessitated by its length, very readily, as the two trucks so widely separated are each on pivots, like the trucks of steam cars. The rigidity of the ordinary street car running gear is avoided, and there is no "grind" on the rails. It is the first time this system has been applied to street cars. The length of these cars necessitates some better form of running gear than that in ordinary use, so the system described was adopted.

The cars ride smoother than any horse car in the city, there being none of the jolting motion so common. The road-bed is so solid and the rails so well joined that the whole road is smooth. The cars are well lighted by end and center lights, and brilliant head-lights are used in front, which light up the street far ahead. There is a large gong outside and on top of the car in front, which, while it sounds a loud alarm, is not heard so much by the passengers as by those it is intended to warn. The engineers and conductors are uniformed neatly; and during the hours when crowds prevail, there is an extra conductor or collector put on the forward car.

It is a mistaken idea that these cars can run no slower than the cable. By reducing the grip pressure, by means of the lever, the cable slips along and the car does not move so rapidly; in fact, it may be slowed to a snail's pace, almost, while waiting for a team to get out of the way; and the starting up is so gradual that no jerk is felt.

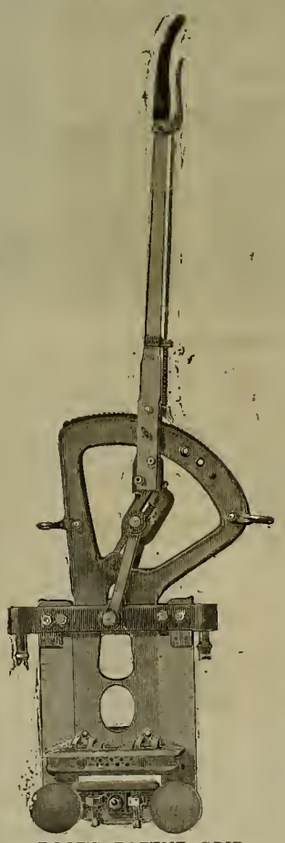
Among other peculiarities in the construction of the cars is that of the fender or "kid-catcher," for picking up any stray youngsters who may fall on the track. It will not do to put a fender or catcher on the car itself, as the car has a considerable range of movement from variable loads and the plunging motion caused by inequalities of the road. The fender can not be, therefore, readily carried at a fixed distance from the ground.

The method adopted is to secure to the forward edge of the rigid truck frames in front of the wheels a plank or frame extending in front of the car itself. It extends across the whole width of the car, and is not over two or three inches above the surface of the track. Knees or braces secure it firmly to the truck frame. The front edge is rounded. The construction of this part of the car is such as to lessen danger in the case of persons falling in front.

We give herewith two engravings showing the details of the running-gear of these cars. The rear truck carries the track brake, which is between the wheels on each side. In addition there are the usual wheel brakes. The forward truck carries the grip and brake levers. A rod connects the rock-shaft of the track-brakes with the hand lever on the front truck. It will be seen that these trucks are similar to those in use on steam railroads, and that they are connected by a single king-bolt or pin with the body of the car. We stated elsewhere that by the use of these trucks the cars turn the curves easily, and ride without jolt.

The Brakes.

The brakes used on these cable railroads are very important factors in the safety of the system. On this road, particularly, running at the speed it does and through a very crowded thoroughfare, it is necessary to have the brake gear



very efficient, in order that sudden stops can be made. It is found in practice that one of these cars, weighing 10,000 pounds, and loaded at that, while running at a speed of eight miles an hour, can be stopped in ten feet. Even air-brakes could not heat this. While the ordinary brakes are attached to the wheels in the usual way, one set for the engineer and one for the conductor, each set acting independently, the main dependence is placed on the track brake.

These track brakes are the outgrowth of the cable railroad system, being adapted for use on very steep grades, where if the wheels were locked, even, the car itself would slide on the rails. It is a very powerful appliance, and by its means one of the heavily loaded cars may be stopped very suddenly. In the first place it may be stated that both the wheel brakes and track brakes are entirely independent of the car body, the whole mechanism being on the trucks, or running gear. The track brake is on the rear truck, as the engraving shows, between the wheels, its operating lever, however, being under control of the engineer or dummy-man who handles the grip.
